Grind Those Flat Surfaces

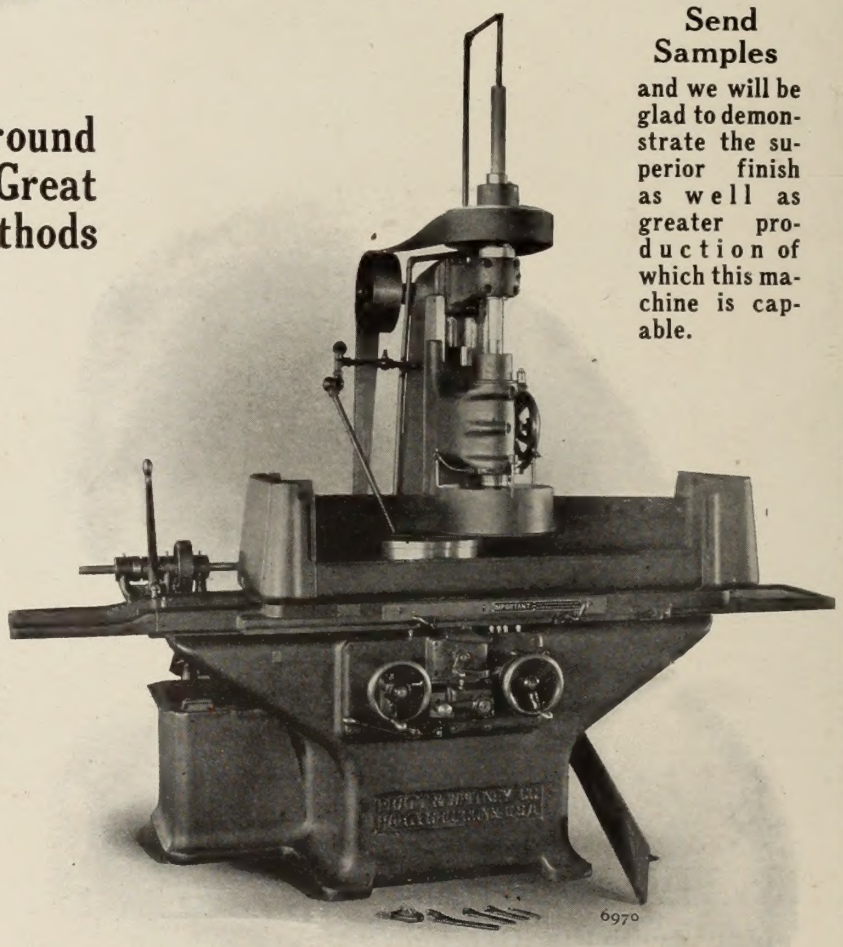
Finishing by grinding has proved its efficiency

P. & W. New Model Vertical Surface Grinder

has proved its ability for rapid, accurate and economical production.

Send Samples

and we will be glad to demonstrate the superior finish as well as greater production of which this machine is capable.



Variety of Work Now Ground from the Rough at a Great Saving over Former Methods

This machine is the only surface grinder possessing the great advantage of the combination of rotary and rectangular reciprocating chucks. Chucks of the magnetic type may be furnished.

The entire control is at the front of the machine and the table is at a convenient height for loading.

Power and rigidity are in excess of the demands of the best wheel, which in conjunction with ease and convenience of operation, insures maximum output.

Write for illustrated circular "Vertical Surface Grinder." It will interest you.

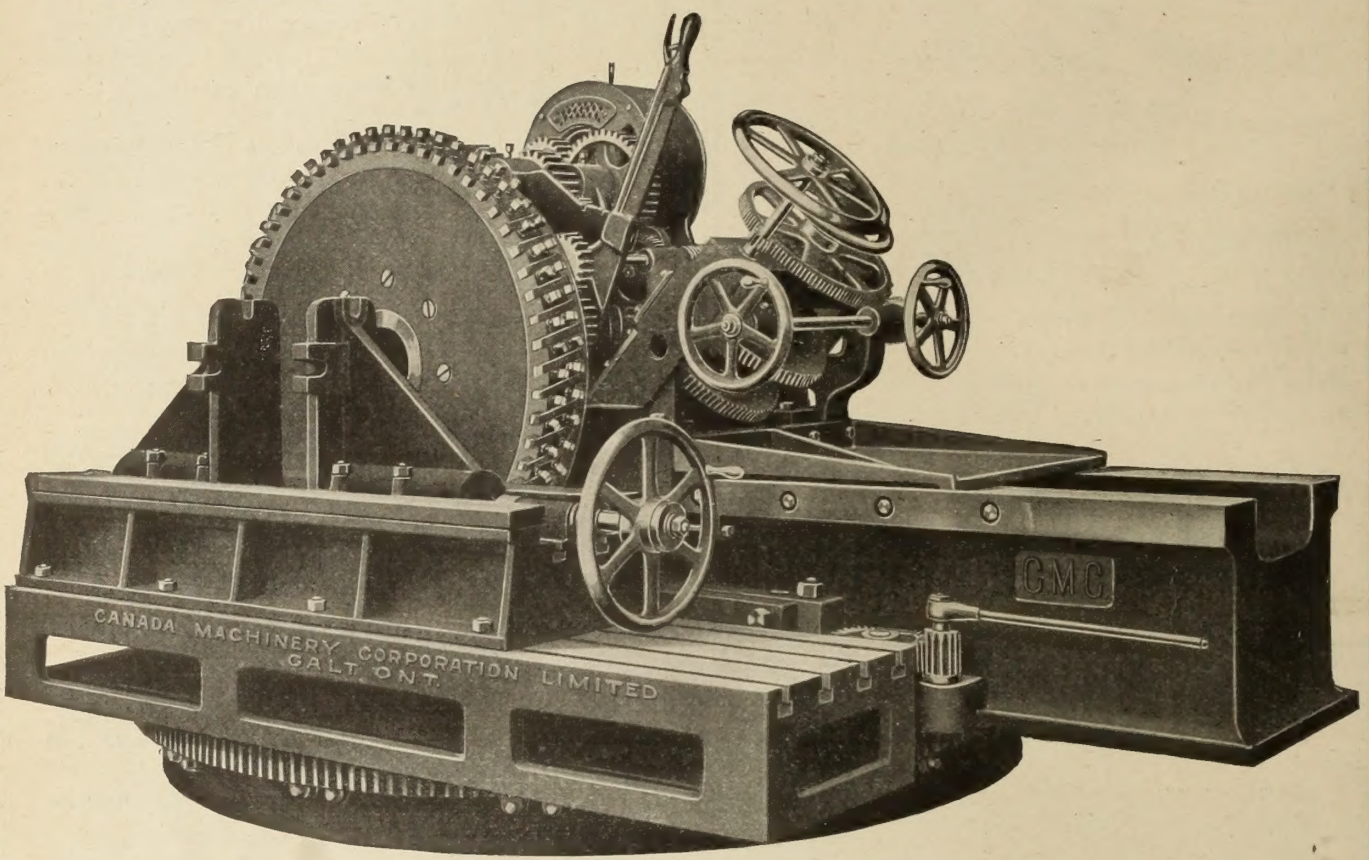
Westinghouse Synchronous Motor Generators

Westinghouse Synchronous Motor Generator Set

WHERE it is desirable to instal an alternating current motor generator set, it is often advantageous to drive it with a synchronous motor.

Such a motor, in addition to driving the set, can be so arranged as to correct the power factor of the system that serves it, irrespective of whether the natural power factor of the system is leading or lagging.



The best service always follows the introduction of Westinghouse Apparatus.

The advertiser would like to know where you saw his advertisement—tell him.

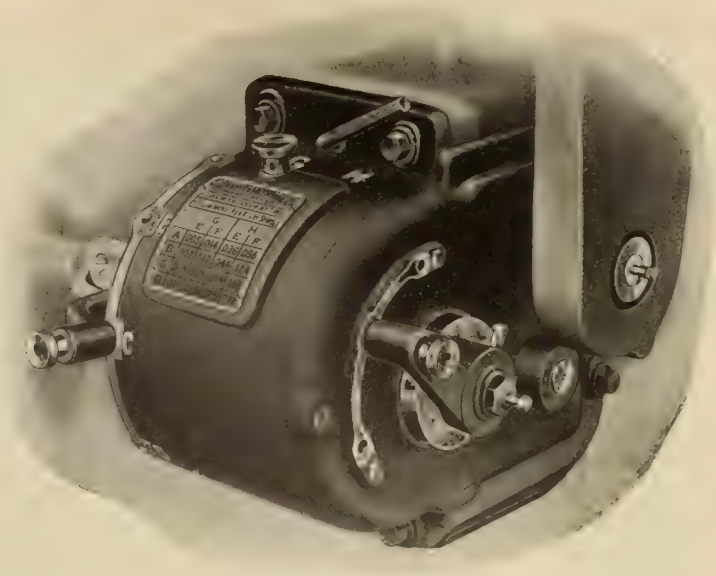
The nature of the feed change and control has an important bearing on the operative efficiency of the miller.

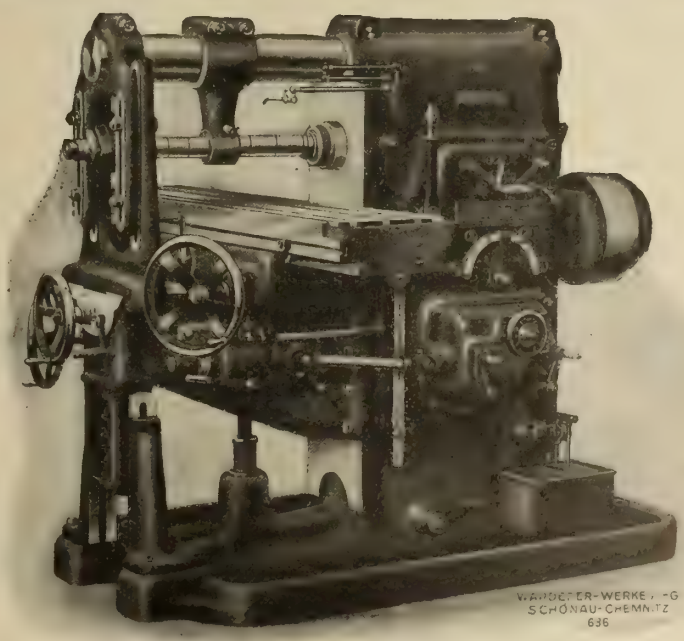


The high development of these on

KEMPSMITH

MILLERS

is an indication of their general excellence.



Sixteen feed changes are obtained, all in *one* self-contained box, entirely through steel spur gears, any one while machine is running, and operating under cut.

All feeds are automatic, and all tripped from *one* central lever at front of knee.

The advertiser would like to know where you saw his advertisement—tell him.

The Morton Travelling Head Draw-Cut Cylinder Planer

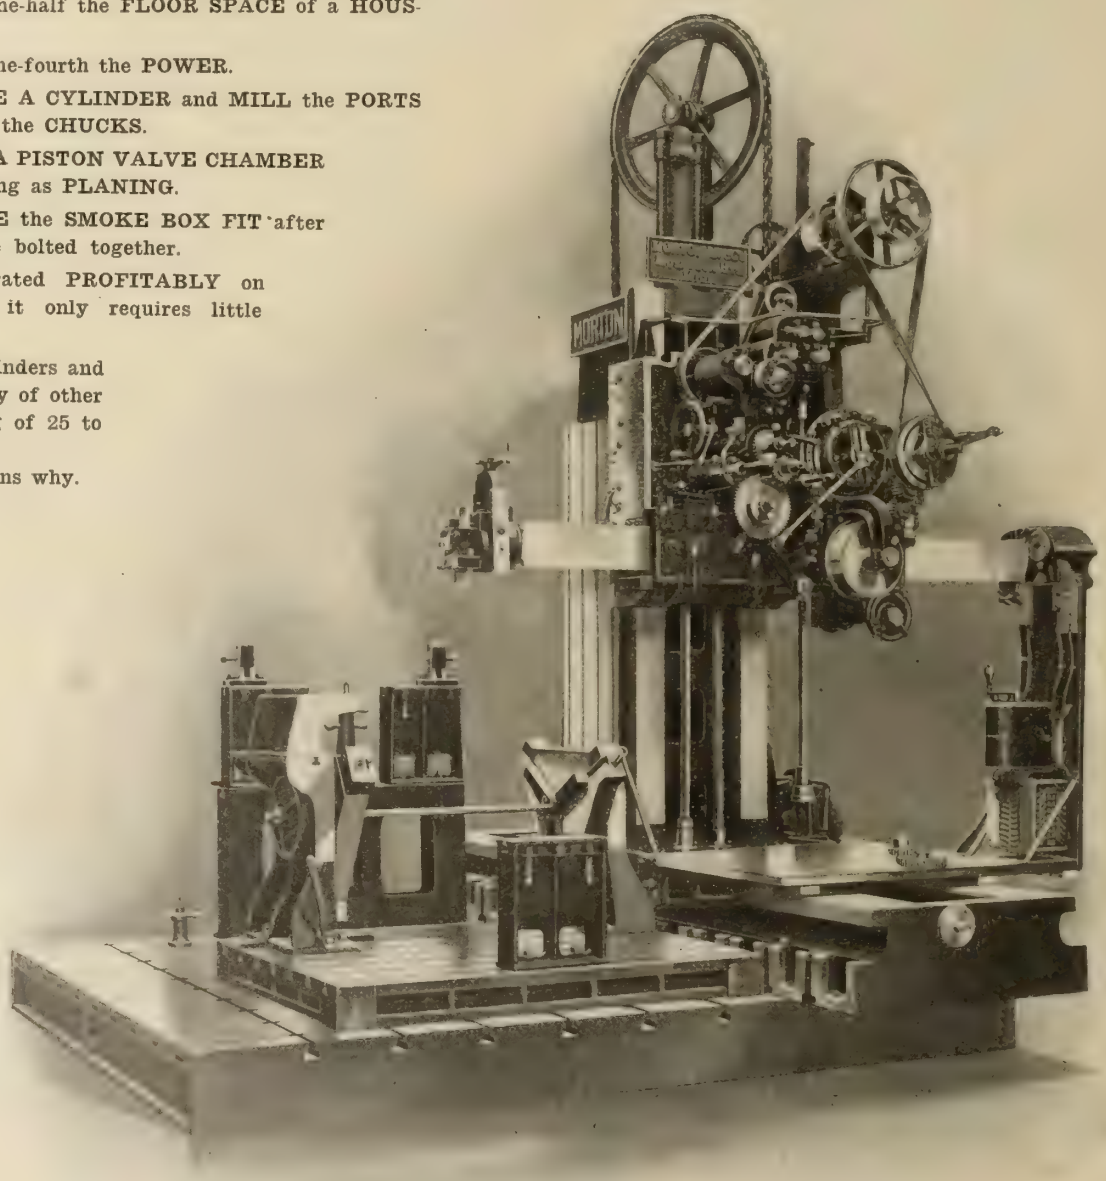
WITH EQUIPMENT

Is a most interesting machine for the railroad shop

BECAUSE

IT REQUIRES one-half the FLOOR SPACE of a HOUSED PLANER.

IT REQUIRES one-fourth the POWER.



IT WILL PLANE A CYLINDER and MILL the PORTS at one setting in the CHUCKS.

IT WILL BORE A PISTON VALVE CHAMBER at the same setting as PLANING.

IT WILL PLANE the SMOKE BOX FIT after CYLINDERS are bolted together.

It can be operated PROFITABLY on smaller work as it only requires little power.

It will plane Cylinders and do a great variety of other work at a saving of 25 to 40 per cent.
Many other reasons why.

PRACTICAL—MODERN—EFFICIENT—PRODUCTIVE.

Write for Bulletin No. 7, illustrating the operations. Can be had for the asking. Address

MORTON MFG. COMPANY, Muskegon Heights, Mich., U.S.A.

The No. 2 Vertical Cincinnati Miller

High Power Design With Cone Drive

This is a modification of our No. 2 Vertical Single Pulley Machine. We have substituted a large 4-step cone with back gears in place of the geared spindle drive mechanism.

It is especially adapted for manufacturing small machine parts, particularly those that require a degree of accuracy that can only be produced on a rigid machine.

It also has many features of handiness that give it special value for die-making and similar work.

The operator can change the direction of the table movement — longitudinal to cross and back again — by the two levers at the front.

He always moves the levers in the direction he wants the table to go. There is no lever down under the table at the back of the knee for determining the direction or reversing. All levers are at the front with the operator.

It is easy to mill around the periphery of a rectangle because the changes in direction can be made without stopping. In fact, both longitudinal and cross feeds can be used in combination when it is profitable to do so.

These things make the man's task easier, enable him to operate the machine quicker and produce more work.

Send us your blue prints and we will show how this applies to your work.

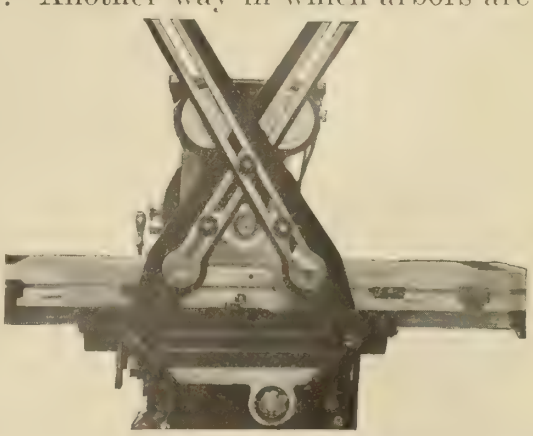
Double Over Arms



are now applied to Milwaukee 3B Plain and Universal Milling Machines, making them b e t t e r than ever for heavy work.

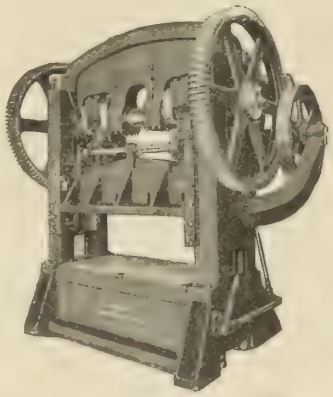
All who have seen this new and radical improvement have asked why it had not been thought of before, as its advantages are apparent at first glance.

Rigidity of the arbor bearings is increased to such an extent that cutters can be used at a much greater distance from the face of the column, making it possible to do certain classes of work that otherwise could not be handled to advantage.

When the various arbor supports are clamped to these two over arms, either supporting the arbor or turned bottom side upward where necessary, the double arms are tied together at intervals in such a way as to form a rigid truss. With heavy work and coarse pitch cutters running close to the arbor bearing the tendency with the single arm has been for the cutter to gradually pound the bearing out of line, cramping the bearing of the spindle itself, producing bad work and consuming more power. Pounding out of line is impossible with the double over arm construction. Furthermore, the arbor, which may not be true, is not depended upon for alignment, but the bearing brings the arbor to positive alignment and keeps it there. Where the arbor runs out of line it has a tendency to crystallize and break at the shoulder. Another way in which arbors are often broken is by the machine being started without the arbor support being clamped or the arm being clamped in the column. With the double over arm construction this is impossible, even though no clamping whatever is done, as there is no possibility of the arbor support rotating as in the case of the single arm.

Braces lightly constructed, so as to be easily applied, form a tie between the top of the knee and the over arm truss as a further check on vibration.

Other improvements in keeping with the double over arm construction are deeper column, heavier knee, both complete box sections with few openings, longer spindle, and 1,000 lbs. more weight.



We can tell you more efficiency features about these machines for the asking.

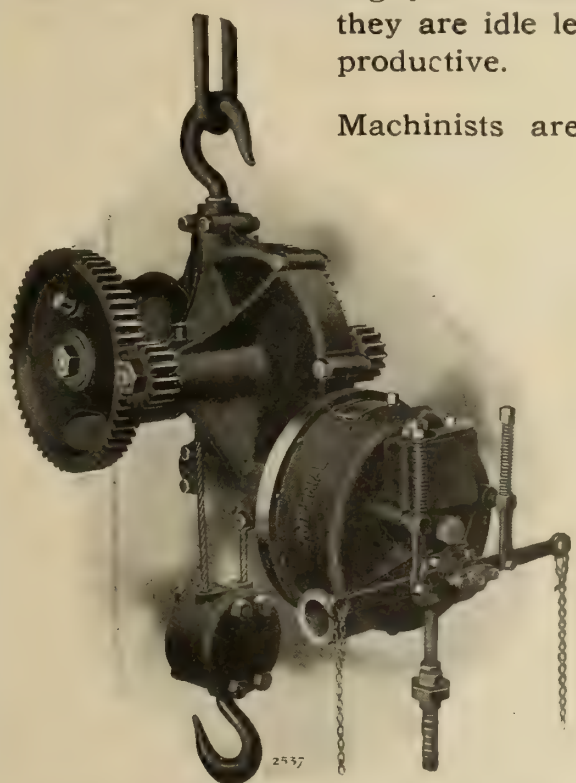
HANDLING MATERIAL

JUST FIGURE OUT HOW MUCH IT COSTS YOU PER DAY FOR THE TIME YOUR MEN SPEND IN SHIFTING MATERIAL

Then take a look through your plant and see what an amount of this needless expense you can cut out by using Ingersoll-Rand Air Hoists.

You'll be amazed at the magnitude of the combined amount of savings you can make.



Handling your material quicker and with less labor is only the first factor. Serving your machine tools quicker means that they are idle less and therefore become more productive.

Machinists are more efficient because they do not need to direct their attention to lifting.

They have both hands and their mind free to use in placing their work quickly and to advantage.

STRAIGHT LIFT AIR HOIST—Built in all capacities.

IMPERIAL MOTOR HOISTS—Built in capacities ranging from 1000 to 10,000 pounds.

IT WILL PAY YOU TO LOOK INTO THE SAVINGS YOU CAN MAKE BY HANDLING YOUR MATERIAL WITH INGERSOLL-RAND AIR HOISTS.

It Often Costs More To Hand Ream Holes Than To Grind Them

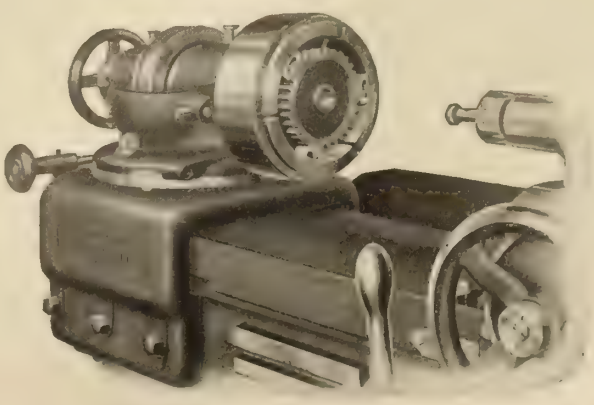
Heald No. 75 Internal Grinder

It is a fact that parts made of bronze or similar metals which are hard to hand ream can oftentimes be ground more rapidly, and with a better finish with the

Heald No. 75 Internal Grinding Machine

This machine is built purposely for handling short holes about 2 in. long or less, and is so simple to handle that an expert operator is not necessary.

The pieces to be ground can usually be held in some of the Heald rapid chucking devices, and as the table feed and cross feed are both performed by hand there is no time lost by having to engage and disengage feed clutches, etc., but all attention can be given to handling the work with the least possible number of motions.

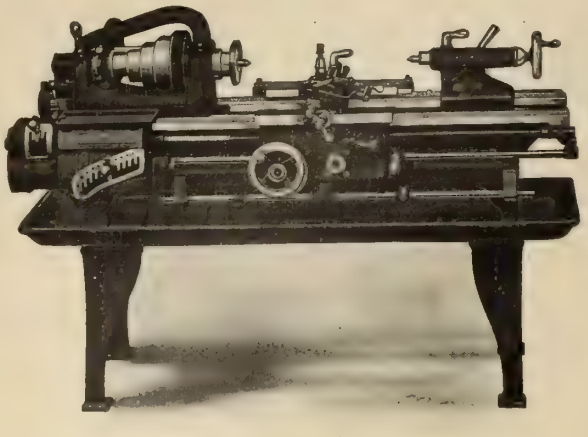


Bronze Bushings and like parts are very hard on reamers, dulling them very quickly, and as soon as the reamer is dull it is very difficult to ream a hole in such metals without tearing.

Therefore, the reaming method of finishing such work is slow and expensive.

But the internal grinding machine makes this work easy, produces holes that are duplicate in diameter and with a finish far superior to that made with a reamer.

Many firms are to to-day getting better holes at a less cost per piece by grinding than they were, a little while back, by hand reaming.



Is it not possible that a change would pay YOU? Write—We will gladly go into detail with you.

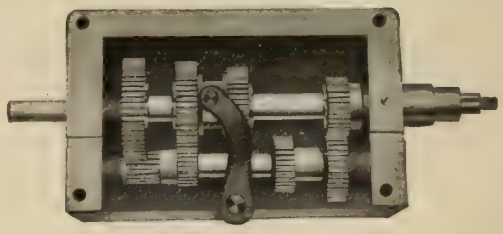
Don't Overlook the Merits of this Lathe

14 and 16-inch QUICK CHANGE LATHES.

Design—proper distribution of metal and convenience in operation. Construction—accuracy in workmanship is given careful consideration. All materials are carefully selected and inspected. These Lathes are built with 5-step cone and single back gears or 3-step cone and double back gears. They may also be furnished with an all-geared feed or plain belt feed and standard change gears.



QUICK CHANGE BOX

QUICK CHANGE GEAR BOX

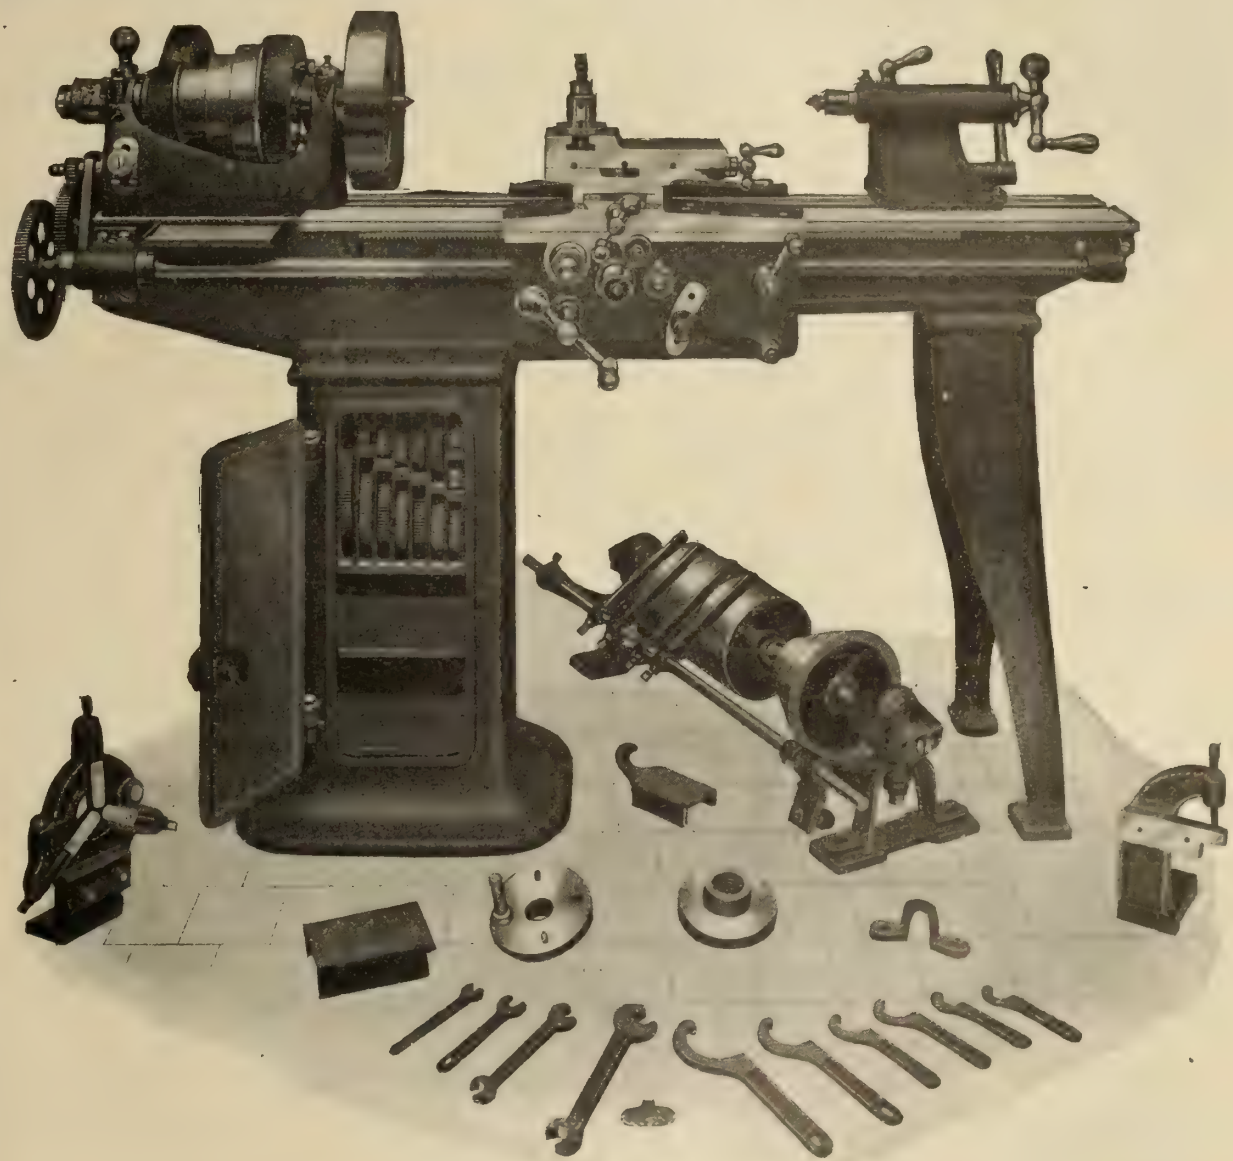
This box is simple in design, and has no overhanging parts at the head end of lathe. 32 changes may be made without removing a single gear and while lathe is running. Lead screw and Feed rod cannot be in operation at the same time. Sliding gears and levers cannot lock mechanism and cause breakage. All gears are steel, and all bearings are bronze bushed. No pull pin, spring keys or complicated parts are used in the construction of this box. Sliding gears have positive clutches. Box can easily be operated by inexperienced workmen without confusion, as there are but two handles necessary to make all changes.

ALL GEARED FEED BOX

When and where positive geared feed is needed or preferred our Geared Feed Box can be attached to our standard lathe with standard change gears, or to our plain manufacturing lathe without lead screw. 4 changes are obtained through sliding gears and positive clutches—these changes are quickly made while lathe is running, and with but one lever on front of box. The range of feeds are unlimited.

GEARED FEED BOX

Plain Belt Feed, with belt tightner, may be furnished if preferred.
These Lathes are worthy of your careful consideration. We are very glad to send you circulars, and prices we can quote you will be interesting.



May we send them? Ask for Circular "G."

Our Improved DUPLEX Belt Driven PIPE CUTTER And THREADER

This machine is guaranteed to give you the very best of service as it has done for others.

We also manufacture single and double head Nipple Machines, and Rapid Upright Roller Pipe Cutters.

Write Us To-Day

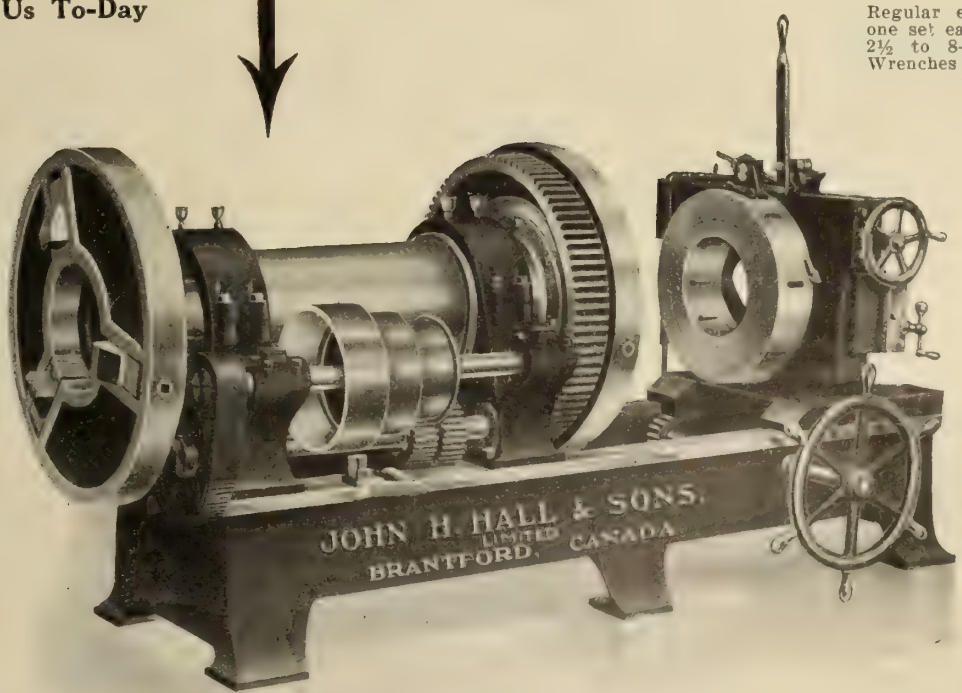
This Machine Most Efficiently Cuts off and Threads Merchant Pipe from 2½ to 8 inches Inclusive

DIE HEAD The Die Head is equipped with the Peerless die mechanism, which is as simple as can be made, yet it can always be depended upon. The cam ring is graduated and can be quickly set for the different sizes of pipe. Heavy steel faced steadying jaws support the pipe when cutting off.

DIES Nine sets of dies are included in the regular equipment, a separate set being furnished for each size of pipe, each set consisting of six chasers. Casing dies can be furnished in place of standard pipe dies or extra as preferred.

CHUCKS The chucks are massive and identical in design, each having three independent jaws operated by powerful screws. Tempered steel grips are dove-tailed into the ends of the jaws; these can be readily removed and resharpened. As the jaws are graduated on the face they can be easily set for any size of pipe. Flange grippers are provided on the rear chuck.

GEARS The Gears have broad face and are machine cut, the main pinion being made of steel.



OIL PUMP An Oil Pump supplies oil to dies and cutting off tool.

CUTTING OFF TOOL The cutting off tool and steady slides are on the back of the die stand, the latter being equipped with interchangeable steel facings.

CONE PULLEY The cone Pulley has three steps, and by means of a compound shifting gear two speeds for the arbor can be obtained from each step of the pulley.

BEARINGS The bearings are all of ample proportions and well babbitted, and all wearing parts are large and accurately fitted.

Regular equipment consists of one set each R.H. Pipe Dies for 2½ to 8-inch pipe inclusive. Wrenches and countershaft.

No Superstition

attaches itself to the year 1913. Instead it holds every promise of great industrial activity and progress.

Are you prepared to meet it? Have you the tools that will enable you to produce the greatest quantity of the highest grade work in the least time?

Consider what an important part small tools play in your operating cost! The contact between the tool and the material determines your profit. The efficiency of every drilling operation depends upon the drill used.

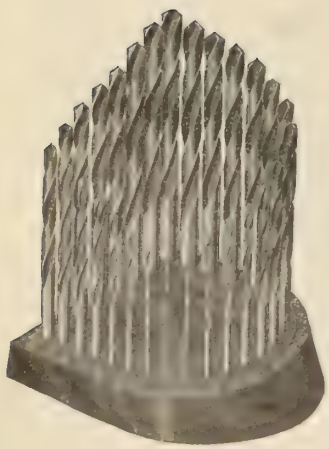
Side Milling Cutters.

"DETROIT" TWIST DRILLS

increase output. They raise the labor of both men and machines to the highest productiveness.

They cut the most metal with the least re-grinding.

This remarkable efficiency is made possible by the steel from which they are made and our methods of tempering it. Our Buyer is an expert in small tool steel, frequent chemical analysis insures constancy, while our heat treatment—the result of 26 years' experience—develops the greatest strength and the longest life in our finished drill.



Trade
Mark

They run true and cut fast.

Every operation is conducted with accuracy. Our drills are ground on their centres after hardening, and no variation greater than the one two-thousandth part of an inch is allowed. Equal lips, central web, and alignment from tip to shank make them as nearly perfect as drills can be made.

Figure out the saving in machinsts' time—and in machine time. Test "Detroit" Drills in your plant. They'll aid you in producing better work and more work in less time. This means money for you.

"Detroit" Twist Drills are sold under a rigid guarantee. They come in all sizes, grooved and taper shank, carbon and high-speed steel and the purchase price will be refunded for any which prove unsatisfactory.

We furnish these stands in oxidized copper effects, which resist rust and dust—practical in shop and tool room.

Get Catalog "R" to-day.

Now, before you make your 1913 requisitions, give "Detroit" products a tryout on your toughest jobs.

A Fluted | B Vee | C Star | D Three Wing | E Bolt Head | F Scraper | G Parting | H Twist Fluted

These are our Special High Speed Profiles—Rolled only by J. Beardshaw & Son, Limited, which can also be supplied in Carbon quality ("Double Conqueror").

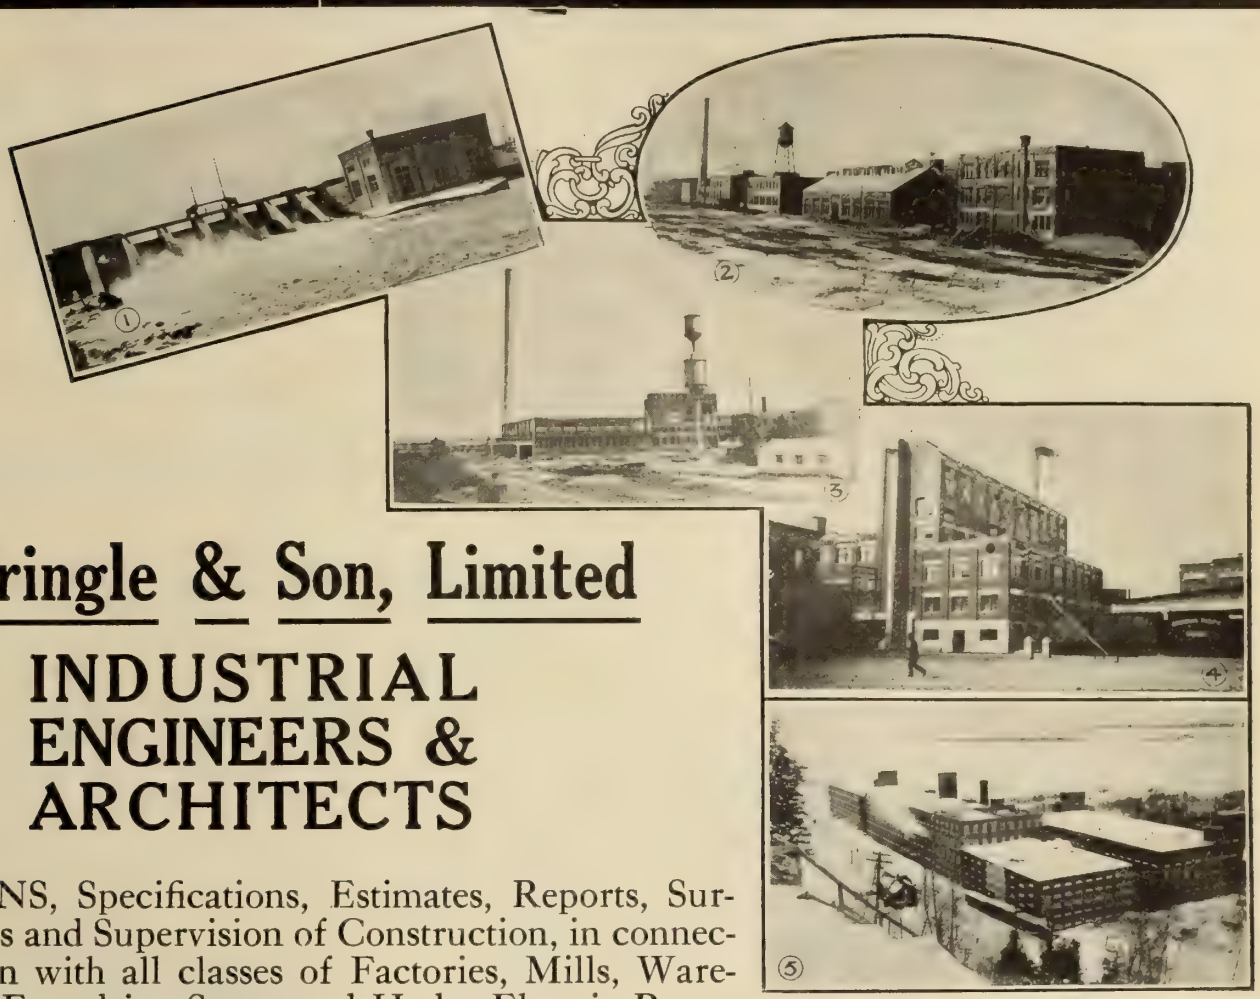
There's "CONQUEROR" Steel for Every Purpose

"Single Conqueror"
This is **Warranted Cast Steel** suitable for Cold Sets, Cold Chisels and Mine Drills, etc.

"Double Conqueror"
This is a higher grade of **Best Warranted Cast Steel** for Chisels, Punches, Taps, Dies, Shear Blades, etc.

"Conqueror"
High Speed Steels in Rounds, Flats, Squares and profile Sections.

We claim our Tool Steels give better results than many other brands.
Our prices are certain to appeal to you.
Before ordering a new supply, investigate the "Conqueror" Brand.
Ask about our new High Speed Steel **"INVINCIBLE"** Brand.



We carry stocks of Improved Conqueror High Speed Drills

Made from our profile Section H, illustrated above, which is rolled hot to the same shape as milled Drills—no milling required.

WARDROBE LOCKER

MATERIAL LOCKER

STEEL BINS

THREE SAVERS

How and What They Save

By being absolutely fireproof they prevent loss in case of fire.

By being metal instead of wood they greatly reduce insurance rates.

By being metal they do not have to be replaced in a lifetime—they take up less space and are nicer in appearance.

Our Wardrobe Locker is an absolute necessity to the welfare of your employees. It prevents petty thefts, contagion, and will enable you to gain the goodwill of your employees.

All " D.L." Standard Metal Lockers have specially well made doors and locking device, and each locker bears a distinctive number and corresponding key.

We also manufacture Steel Shelving. It is built on the unit system —sections can be added as requirements expand. It is easily assembled, is adjustable and adapted to many uses. It possesses great strength and stability, and economizes much space. All shelves are provided with label holders.

If interested in keeping down expense and making a systematic shop, write for catalog and full particulars.

High Speed Steel Has a Solid Foundation In a Name That Means Something

Cutting speed attained on cast iron: Roughing cut, 140 ft. per minute—finishing cut, 210 ft. per minute.

In NOVO SUPERIOR you secure a materially increased speed over the high speed steels now in use, the highest quality, greatest toughness, longest life (3 times that of any other) and exceptional ability to cut very hard materials. The cutting edge retains its sharpness from 3 to 4 times longer than other high speed steels. Hardens in oil, air or water, and is now carried in stock in our warehouse in all current sizes, flat, squares and rounds; annealed and unannealed.

Advertising Without Waste

There is one sure way of making your advertising hit the mark. It will hit it every day in the year and several times a day. It is a way that is as sure as time itself.

What Date Is This?

Every day you ask yourself this question.

Every one with an interest in life asks it. What or who supplies the answer?

Calendars—Advertising Calendars, and the concerns who distribute them!

Because of the universal service it renders, the advertising calendar is indispensable. Business would be poor business without it.

Every time it is consulted it creates a sense of gratitude towards the firm that is responsible for its production. It finds a place in offices and homes that mere money could not buy.

It will command for circular matter, catalogues and personal letters a degree of respect that they could not otherwise enjoy.

A Calendar, if a HOUGH product, will give any house and its salesmen a standing that no other one form of advertising can possibly give.

An attractive design lithographed in colors, featuring strongly (but not objectionably so) your name and product—a good-sized calendar tab with readable date characters, the whole artistically arranged and produced in HOUGH style, distributed in channels from which you might reasonably expect business—will produce results for you—and abundantly.

Hough Products Bring Results

We specialize in calendars and other high grade lithographed advertising matter. By concentrating we are able to give you maximum advertising and absolute satisfaction, at a surprisingly low price. We have turned out some big things for some big firms that have brought big results. If you will give us the opportunity—the same unsurpassed facilities, the same long and full experience, and the same courteous service that has completely satisfied others will be made to please you through the increased business they will create.

It will cost you nothing but a letter or card to find out how **you can profit by serving your public with an advertising calendar. Advertise on Time!**

Get Your Men and Machinery on the Safe Side

THE Safety of your employees is an important matter, one which the Law demands shall have your attention.

¶The Dodge Friction Clutch provides the maximum of safety to your men in that it enables the power to be cut off in the nick of time. There are laws in force in some countries demanding the use of friction clutches for just this reason.

¶The Safety of your machines from idleness, means increased production.

¶Dodge Friction Clutches on the line-shaft do away with the necessity of shutting down several departments when some little thing goes wrong, or you want to make an installation or alteration. They also eliminate waste power in idle departments, or in other words

¶The Dodge Friction Clutch puts your men and machines on the safe side at small expense. It is split, that means can be put up and taken down without disturbing other equipment, can be used as a cut-off coupling, for driving pulley or rope sheave, or for attachment to quill carrying a main driving wheel.

¶Our Engineering Department will gladly give you correct advice on subdividing your power transmission machinery into separate safe and efficient units.

Mail us the attached coupon or postal card for our booklet "Friction Clutch Mechanisms"

Ball and Socket Adjustable Hanger

Ball and Socket Adjustable Hanger

The Most Economical Roadbed For Power

THAT steady, stealthy *loss* that besets so many factories—*excess bearing friction*—can be eliminated easily and at a very moderate cost by the use of ball and socket, self-lubricating hangers and bearings correctly designed and carefully made. It is a surer way than resorting to ball or roller bearings or individual motors and is far less expensive in both first cost and upkeep.

Dodge bearings reduce friction because there is a true ball and socket connection between the bearing and the frame in hangers and pillow blocks, which permits the bearing to freely align with the shaft. That means equal pressure and reduced friction.

Alignment of shafting is a very important factor in eliminating excess friction and perfect alignment can only be obtained by adjustments which preserve the necessary ball and socket connection. This is accomplished in Dodge hangers by means of a *four-way adjustment.* Vertically by large diameter threaded cast iron plunger screws, machined on the ends to fit the ball on the bearings, and horizontally through slotted holes in the base of the frame. This is the only proper method of four-way adjustment.

In a true ball and socket hanger, with self-lubricating bearings having a perfect and continuous circulation of lubricant, the shaft runs on a film of oil and does not touch the metal lining of the bearing. That is the kind of hanger the Dodge is. For day in and day out, year after year service it is the most nearly "anti-friction," and the most economical shafting bearing on the market to-day.

Dodge hangers and pillow blocks are furnished with ring or capillary self-oiling bearings, all lined with a high grade metal, and *bored* and *reamed.* One filling of oil will last three to six months. They are carried in stock at Dodge branches and by leading machinery and supply dealers in all parts of the country. When buying hangers, pillow blocks, or any shafting bearings, specify Dodge. They will make the best roadbed for *your* power.

Send for latest catalogue.

Dodge

Wood Split Pulleys

"1886"
"1912"

26 Years in Service

WHEN you buy wood split pulleys, you should be sure to get good pulleys; pulleys that will prove to be an investment, not an expense.

Dodge "Standard" are good wood split pulleys. Just as good as selected, seasoned, kiln-dried stock, combined with skilled workmanship and twenty-six years of "knowing how" can make them.

The proof of any pulley is in the running. Dodge wood split pulleys are balanced, and run true. They are backed by the Dodge guaranty. There are over one million "Standard" wood split pulleys in successful operation and the output each year is greater than the year before.

There are reasons for this. First, the quality and merit of the pulley. The facility with which it can be mounted on the shaft. The interchangeable bushings, by means of which it fits all sizes of shafting within a wide range. The perfect shaft fastening without keys or setscrews. The superior belt surface. And, last, the moderate price as compared with pulleys of any other type. Dodge wood split pulleys will run satisfactorily anywhere that regular leather belting can be used.

FLEXIBLE

METAL HOSE

Its Uses and Advantages over Rubber Hose

For the conveying of steam where the heat is frequently practically equal to the temperature required for vulcanizing rubber.

For conveying of oils and other liquids which act chemically to decompose rubber.

For suction hose where the vacuum created causes rubber hose to collapse.

For gas which adversely affects rubber hose, causing leaks, creating bad odors and being dangerous to life as well.

For all pneumatic purposes and for driving drills where the rough work causes abrasion to rubber hose.

For cleaning boiler flues where the heat of steam quickly destroys rubber hose.

For air-brake equipment and the steam heating of railway cars.

For contractors' building operations, for use in temporary water supply where it cannot be crushed and destroyed by abrasion and rough usage.

For fire prevention in buildings of all kinds.

For oiling machinery and for all purposes where a flexible medium is required.

For Vacuum hose.

In Steel, Copper and Brass

Its lasting qualities are many times greater than those of rubber and there is practically no cost of maintenance.

Do you not think that our **Flexible Interlocking Metal Hose would be tbe best hose to use ?**

Carried in stock in sizes from 3-16 to 12 in., inside diameter.

A trial will convince you that it is just as we claim.

PROFESSOR STRIBECK

THE GREAT GERMAN AUTHORITY TESTED MAGNOLIA METAL

AT THE CENTRAL TECHNICAL EXPERIMENTING ESTABLISHMENT, NEW BUBLESBERG

His report of this test was voluminous and there were fourteen diagrams, therefore we can only give in this limited space his

"CONCLUSION"

"The Magnolia Metal Bearing ran itself rapidly and well into good working order with the **thin** Velocity Spindle Oil. Under pressures for which this oil was too thin and with lubrication faulty, the surface of the Magnolia Metal bearing suffered no harm; it rather adapted itself more and more to the journal and became more highly polished. The bearing once in good working order ran well at 380 revolutions per minute under a pressure of 30 kg|cm² or 426 lbs.|inch² with Thin Spindle Oil and also with Paraffin Oil. With Gas Engine Oil, as lubricant, much greater pressures were admissible at 390 revolutions per minute. At 740 revolutions per minute the bearing ran well, even at 38 kg|cm² or 540 lbs.|inch², and at 1110 revolutions per minute a pressure of 26 kg|cm² or 370 lbs.|inch² could be applied. As regards the influence of pressure, speed and temperature upon the friction co-efficients, the accompanying diagrams give full information.

(Signed) Stribeck."

Belts For All Purposes

Scandinavia Belting

¶ This is the original solid woven belt, and for direct drives whether straight or crossed, cannot be surpassed.

¶ Ask the man who has used it.

¶ This belt used for both transmission and conveyor purposes.

Lanco Genuine Balata Belting

¶ For use in places which vary from wet to dry.

¶ Good for high speeds, and can be made endless.

¶ When buying a Balata belt, it pays to buy only a high quality belt.

Special High Speed Leather Belting

¶ When belts are required to run at high speeds over small pulleys, it is a difficult matter to get the right belt for the work.

¶ We have it.

INSTAL THE

FULTON WATER-COOLED MECHANICAL STOKER

AND GET

Highest Efficiency
Heavy Overload Capacity
Smokeless Combustion and
Repairs Almost Eliminated

NATURAL DRAFT—No complicated Auxiliaries to instal and maintain. Just one small operating engine taking less than one-half of one per cent. of steam generated. Complete automatic control with Damper Regulator.

HEAVY OVERLOADS—Overloads up to 250 per cent. of Boiler rating are quite possible with light and medium draft pressures. In a large plant 100 per cent. continuous overload was carried with a draft at the grate averaging .176 inches water, burning 32 lbs. of coal per square foot of grate per hour. By the action of the grates the coal is kept continually in motion.

LOW REPAIRS—One thousand horse power plant of these stokers in four years cost 2 . 4 cents per horse power per year to maintain. Every grate bar has a 1¼ in. extra strong seamless tube cast in it, carrying boiler circulation by the flash principle. Velocity of water exceeds 50 feet per sec., therefore scale imposible. We guarantee your repair bill.

LABOR AND ATTENDANCE—No poking, slicing or stirring of the fire necessary at all, in fact the usual slice bar is not required. Cleaning is automatic, and complete.

Doing It The Right Way
At the Rate of 210 per Hour

Here is a good example of manufacturing economy, brought about by substituting an improved Gardner Disc Grinder for the old-time methods. This particular illustration represents an increased output of 5 to 1, and a fifty per cent. better job than was accomplished by former machining process.

You know what a gas burner is as used on the ordinary gas range for cooking. It is merely required to face off the circular ends of these pieces straight and clean for an air adjusting cap. A very simple fixture, mounted on our Lever Feed Table, holds the piece while being ground. With unskilled labor these pieces are Gardner Ground at the rate of 210 per hour.

We do not claim Gardner Grinders will do everything, but we do claim there are innumerable pieces now being finished on shapers, milling machines, lathes, planers and precision grinders, that can be Gardner Ground with equal or superior accuracy, 3 to 30 times faster than they can be finished on the machines above mentioned.

Make us prove this statement by grinding some of your samples—free of charge. Our free 26-page Booklet of Tests contains much valuable data.

BELOIT WISCONSIN

"Canadian Machinery" to Become a Weekly

¶ With the mailing of our next issue, on January 30th, "CANADIAN MACHINERY" becomes a weekly instead of a monthly, as heretofore, the date of issue to be Thursday.

¶ During the past few years the developments in machinery manufacturing, in the establishment of railway shops, iron and steel industries, and large power plants in Canada, have been such that the interests of both readers and advertisers will be better served by our weekly issues.

¶ Conditions in the machinery manufacturing and metal trades have greatly changed during the past year or two. Manufacturers and mechanical men, both in Canada and other countries, are constantly improving the quality and efficiency of their product, and in order to keep our large army of readers promptly and fully informed regarding developments, the more frequent issue is necessary.

¶ News features regarding developments in the iron and steel industries in Canada, together with market reports, will be important departments in the weekly issues but the strictly mechanical side of our journal will not be overlooked, and this will be continued as in the past.

¶ "CANADIAN MACHINERY" has a strong paid-up subscription list as a monthly, and the weekly issues will be mailed to our present list of subscribers. An energetic circulation campaign will be carried on in order to take advantage of the broader field opened up by the change to be made.

¶ Advertisers wishing to carry on an aggressive campaign in the field covered by "CANADIAN MACHINERY" can place the utmost confidence in our weekly issue right from the start, as our journal has had the confidence of our readers as a monthly, and will merit increased confidence through the better service we will be able to give in the weekly issues.

¶ The advertising rates will be much less per insertion than at present, and the more frequent issue will give advertisers the opportunity of helping their business to keep pace with the rapid development of our country.

¶ To both readers and advertisers we wish to express our thanks for their confidence in the past, and trust we may be privileged to continue to serve you in the future.

The Publishers.

BEARDMORE'S LEATHER BELTING

We Like to Advertise Facts

The above cut shows a recent shipment of two large drive belts made for the Dominion Iron & Steel Co., Limited, Sydney, N.S. The dimensions of the belts are as follows:

Length 77 ft. 11 in., width 52 in., extra heavy double.
Length 133 ft., width 52 in., extra heavy double.

We are unique in our equipment for the manufacture of large belting orders promptly. All leather used is made in our own tanneries from the raw material.

No. 3A Universal Milling Machine

The Constant Speed Drive Enables You to Pull Heavy Cuts

The constant speed drive type of milling machine was originated at the shops of the Brown & Sharpe Mfg. Co., and placed upon the market by them. The fundamental principle of this type of machine is a single pulley or motor running at a constant speed, from which develop features that are distinctly advantageous in modern milling machine practice.

Brown and Sharpe

on a Milling Machine is just as much of a guarantee to you as the name "Sterling" on silver. You can depend upon a B. & S. Machine to accomplish what is claimed for it. A glance at the above illustration will show the lines and proportions of the machine as a whole, the heavy and massive frame, the large and rigid base, the vertical depth of table, saddle and knee, the rigid arm brace and arbor support, and the accessibility of all hand wheels and levers for controlling the various movements.

Any standard constant speed motor can be employed on this machine. The drive is direct from the countershaft to the machine driving pulley, which is of large diameter and runs at a constant speed.

Capacity of this machine is, longitudinal feed, 30 in.; transverse feed, 10 in.; vertical feed, 19 in.; all feeds automatic.

Write to our nearest branch for special circular containing full description and specifications of the B. & S. No. 3 Universal Milling Machine.

RETROSPECT AND PROSPECT

EDITORIAL OBSERVATIONS.

FROM a study of the opinions regarding the business outlook forwarded us by a thoroughly representative body of Canadian manufacturers, the outstanding fact is clearly established that no setback is in immediate prospect, and that the gigantic strides made in progress and development during the past year will form but stepping stones to a still higher degree of achievement in the year on which we have entered.

When we consider the number and variety of manufacturing plants which have recently sprung into existence or have been extended and enlarged, and take cognizance of their more or less successful record of competitive production, it is forcibly impressed upon us that not a little glory attaches to our "Captains of Industry" under whose guidance and direction this desirable consummation has been brought about. The note is one of optimism and it strikes a responsive chord in the heart of every citizen of the Dominion. Combined with this optimism, there is unbounded confidence shown in the various enterprises undertaken, and whether we occupy the position of director or operator, there is inspiration to be derived which will impart impetus to our efforts to help in our country's upbuilding.

A perusal of the editorial pages of this number will convince the most sceptical that the foundations of a great industrial future are being laid in this land, and if favored by a succession of bountiful harvests (agricultural and horticultural), together with the continued reclamation of our mineral wealth, there is, without doubt, in store for us, a consistently accelerating progress towards our attaining in a few years a high place among the commercial nations of the world.

LOCOMOTIVE OUTLOOK FOR 1913.

THE Canadian Locomotive Co., Ltd., have supplied the following facts, indicating the great progress they have made in the past, and showing what can be expected from them in the future. The output of their plant to-day is 9 engines per month; when the present company took hold, it was only 5 engines per month. The output should increase to 25 per month when the improvements going on are completed. The present plant consists of power house, boiler shop, tank shop, smith shop, tender shop, upper and lower machine shop, carpenter shop, pattern shop and erecting shop.

The construction of new shops is being rushed with all possible dispatch, and one of them, the tank and tender shop, is now complete and in operation. This building is 345 x 70 ft., and the equipment is modern. A new foundry is under way, which will be about 152x115 ft., and will be equipped with everything of the latest and newest design.

A new erecting shop will be built, which will be able to take care of 25 engines per month. A new machine shop is also being built which will be about 200 x 75 ft., and equipped in the most modern fashion. A new pattern and carpenter shop is at present under course of construction, and should be finished early in the new year. New offices will also be built in 1913.

THE MACHINE TOOL OUTLOOK.

IN response to an enquiry as to what were the machine tool prospects for the year 1913, the A. R. Williams Machinery Co., Ltd., write:—"Trade conditions for the past year in our line have been very encouraging indeed, and while we cannot report anything like the boom for machinery of 1907, yet the conditions are such as to indicate a steady growth in the industrial development of the country. Manufacturers, too, are beginning to realize that the increased competition which accompanies this growth, calls for more up-to-date methods, and there is an increasing demand for modern rapid production tools and equipment.

"The outlook for 1913 seems to be unusually bright. The rapidly increasing value of the Canadian markets is attracting the attention of manufacturers the world over, and the necessity of competing successfully for the rich harvest that is offered in the growing needs of the Canadian people, renders closer and more intimate connections with this country necessary, and we confidently look forward to a larger influx of American manufacturers during the new year than ever before.

"English and European manufacturers are also beginning to realize more than ever the profitable field which awaits their enterprise in Canada, and to throw aside in some degree the conservatism that has hitherto marked their attitude to the developments in manufacturing conditions, which demand radical changes in machine tool design, and are beginning to realize that if they would compete successfully in our market they must adapt their product to the standards and conditions of a new country."

HON. NATHANIEL CURRY'S VIEWS.

CONCERNING my views on the trade outlook, there is probably no prophet on such matters pessimistic enough to predict anything but a banner year for Canada in 1913, unless he be a war prophet as well. This possibility is always more or less in evidence and of course it looms large at present, but we depend on the diplomacy of the Powers to avert any such disaster.

Speaking from a manufacturing standpoint, I do not think you can find any manufacturer who is not looking forward to and making provision for a substantial increase in his business. The railways are a tell-tale in this respect, and they have made the largest purchases of rolling stock and other equipment in their history, to provide for the new year's traffic.

The amount of new building, as well as extensions and improvements to existing plants throughout Canada, is of such extent as to make it almost impossible for the builders to procure materials and complete their contracts in the specified time.

With regard to the question of bounty and tariff legislation, a sufficient supply of steel and iron is the foundation of manufacturing, and this supply should be furnished by Canadian companies. The danger and uncertainty of depending on British and foreign countries for these commodities is being keenly felt at the present time. The demand in the United States, during at

least another year, for strictly home consumption, will be greater than the total output of American furnaces, consequently Canadian manufacturers find it impossible to get anything like the tonnage required and contracted for, and I am afraid that many Canadian industries will suffer during the next twelve months for want of iron and steel. In my opinion, the Government should consult with our large makers of iron and steel, and offer such encouragement as will result in the early enlarging and equipping of their works, sufficient to take care of Canadian wants and for the making and rolling of all sections and shapes that now have to be imported.

Senator Curry is an ex-president of the Canadian Manufacturers' Association and is well known as a director of many industrial undertakings throughout the Dominion.

THOS. CANTLEY'S VIEWS.

THE conditions governing the iron and steel trade of Canada, during year 1912, were unique, the consumption of iron and steel products by the railway and engineering works of the country being greater, and the demand from all sources larger, than ever before in Canada's history. The iron, steel and engineering trades of Great Britain, Germany, and other Continental countries were also, in a highly prosperous condition, and prices in their markets continued to advance throughout the whole of the year.

Dumping by U.S. Iron Masters.

With an enormous home demand and great prosperity in Europe, it would have been natural to suppose that satisfactory prices would have been obtained by the Canadian producers. Such, however, was not the case, due entirely to the action of the iron masters of the United States who, during the first half of the year, flooded our market with both raw pig-iron and finished steel bars, dumped into Canada quite irrespective of profit or even of cost of production. The extent to which the Dominion was thus utilized as a dumping market is shown by the fact that of the entire export trade of the United States in pig iron, ninety per cent. was disposed of in Canada. To this there must be added a further enormous tonnage in finished steel products, a considerable portion, at least, of which was sold in our central provinces at prices fully twenty-five per cent. below that at which they were selling raw pig iron some five years ago.

The middle of the second quarter of the year saw a slight pause in the American scramble to sell, and a couple of months later Canadian consumers who had a few months before contracted with United States mills for large amounts of tonnage of finished steel, found it difficult to get deliveries even though willing to pay a premium of several dollars a ton for prompt shipment. Conditions, thereafter, improved materially, and the last quarter of the year has brought with it very considerable improvement in most directions, although some of the Canadian mills have doubtless considerable tonnage on their books taken at prices very much below those now ruling. Thus, notwithstanding the enormous demand, Canadian producers found their earnings for the year 1912 very much less than they should have been, owing to the totally inadequate customs tariff which applied to a very considerable percentage of iron and steel products thrown into Canada by the United States furnaces and mills.

Consumption and Production.

The Canadian consumption of iron and steel products for the first half of the past year was over 30 per cent. greater than the corresponding period of 1911, while the increase in production will probably be found to be in the vicinity of 15 to 18 per cent.

The growth in production, in view of the disappointing profits obtaining in the operation of the Canadian plants during the past two years, is, we think, indicative of the fact that the iron and steel operators have faith in the growth of the country and look forward to such a readjustment of the tariff as will correct, and make less harmful than during the past few years, the dumping of surplus products by their neighbors to the south of the international boundary.

Nova Scotia Steel & Coal Co. Output.

The outputs of the Nova Scotia Co. for the year 1912 will probably be about as follows:

	Tons.
Coal, total quantity mined	855,000
Iron ore, mined at Wabana	563,000
Pig iron and open hearth steel output will total, say the former	68,600
and the latter	80,600

The last two items are somewhat less than for the previous year, due to the fact that the blast furnace was out of commission forty-five days, from March 25th to May 9th, during which period it was completely relined, the necessity for which was foreshadowed in the annual report of 1911. The total shipments from the New Glasgow works exceeded 75,000 tons, and the order-books of the Scotia Company are at present well filled.

It is expected that the iron ore output will be considerably larger than that of any past year, due entirely to the large increase in the output of the submarine sections of the company's Wabana property. The entire quantity which it is thought will be available during 1913 has already been sold at favorable prices.

Important Events in the Steel Industry.

The early summer saw the culmination of two very important stages in the industrial progress of Canada. These consisted in the completion of the necessary installation and initial operation of a plant for fluid compressing steel ingots by the Harmet process, at Sydney Mines, and the successful inauguration at New Glasgow of a modern forge equipped with hydraulic presses, replacing steam hammers for heavy work. The Harmet fluid compression plant consists of two groups—one group of presses dealing with ingots of three to five tons; the other having a capacity for large ingots of from fifteen to twenty-five tons in weight.

Following the installation of the fluid compression plant at Sydney Mines, the new forge department at New Glasgow was brought into operation Here, steam-hydraulic forging presses of 4,000 tons capacity replace the old steam-hammer in vogue during the first forty years of the company's existence. This equipment is equal, and in some important respects is superior, to any on this continent, and places the Scotia Company in the forefront as producers of forgings. The work of both these units has been in the highest degree satisfactory; the fluid pressing process produces metal free from unsoundness and especially suitable for use where the highest degree of reliability is desirable. The forging press manufactures this steel into forgings of the best grade obtainable.

As to the future, the consumption requirements of the country are large and certain to grow. The only factor necessary to ensure that our iron and steel producing capacity of the country shall keep pace with its increased requirements is a readjustment of the metal tariff such as will give a reasonable amount of protection, taking into account the increased labor, assembly and distribution costs in comparison with those of foreign competing countries.

MAYOR T. R. DEACON, WINNIPEG.

FOR the first time in its history, Winnipeg has a Mayor, a leading manufacturer. Mr. T. R. Deacon, the present occupant of the office, is the managing director of the Manitoba Bridge and Iron Works Co., Ltd., whose business has

grown very rapidly since he started it not many years ago. Although the work of developing such a business has been very strenuous, nevertheless Mr. Deacon has found time to give to public business. When the interests of manufacturing have been at stake. Mr. Deacon has always been in the front rank of those who sought to protect the struggling industries of a new city. He knew that the difficulties to overcome were not slight. and it was his constant aim to encourage more general interest in manufacturing.

When asked to tell of the experience of Winnipeg during the year. 1912, he said:

Increase in Output.

"Manufacturing in Winnipeg has increased during the year 1912 by over 30 per cent., and this is general throughout all the various lines of goods manufactured in the city, and does not include a number of new factories that have been built and have not yet commenced to manufacture.

"The advent of abundance of cheap power has given a stimulus to manufacturing here, and while the high price of land has been to a certain extent a deterrent to the larger lines of manufactories establishing in the city, it is not so serious in the case of smaller or lighter lines that can utilize several floors of a building, and these latter are rapidly multiplying in the city.

Real Estate and Capital.

"Owing to the large profits that have been available from land transactions, and the high rate of interest obtainable from mortgage loans, it has not been easy to obtain capital for industrial enterprises; yet, 106 new charters for industrials have been granted in the city of Winnipeg during the past year, with an authorized capital of $14,250,000, and old companies have increased their authorized capital by $4,500,000. Building permits have been issued for factory buildings and extensions to the extent of $1,750,000 during the year.

Pay Roll $1,000,000 a Month.

"The present strictly manufacturing pay roll is about $1,000,000 per month, distributed among 16,500 employees, and the total output for the year will be in the neighborhood of $51,000,000 worth of manufactured product. Stability of tariff conditions has given more confidence to investors in this line, and a steady growth of industrial development throughout all Western Canada is now assured."

It may be taken for granted that costs got out in the old style are never available for any practical purpose other than accountancy use.

CENSUS OF CANADA'S INDUSTRIES.

THE information obtained from the census of the manufactures of Canada taken in June, 1911, has just made its appearance in the form of a bulletin from the Government Census Department. Some of the data was made public by Mr. Archibald Blue in a speech at the annual meeting of the Manufacturers' Association in September, but much is entirely new.

The returns show that at the time of the census, Canada had 19,218 manufacturing establishments, with a capital of $1,247,573,609; 215,193 employees; a pay roll of $645,288,733; using raw materials to the value of $601,509,018, and turning out products to the value of $1,165,975,639.

Growth in Ten Years.

In ten years the number of establishments increased by 4,568; capital by $800,000,000; employees by 176,000; wages by $128,000,000; raw materials handled, by $335,000,000, and finished products by $685,000,000.

The extensive development of Canada's industries is indicated by the immense output of some of the establishments. One in Nova Scotia, during 1910, turned out more than eight million dollars' worth of products; one in Ontario, more than nine million dollars' worth, and two in Quebec, more than ten million dollars' worth. There were fourteen establishments which had a production just under seven million dollars each for the year.

Ontario in Lead.

Ontario continues the banner Province for manufacturing, having 6,543 establishments; Quebec comes next with 4,845; Nova Scotia following with 1,188; New Brunswick, 919; British Columbia, 392; Prince Edward Island, 334; Manitoba, 324; Alberta and Saskatchewan together, 105.

The figures indicate that amalgamation was practised in Ontario to a very large extent, as during the last five years the number of manufacturing establishments increased by only five, while the total capitalization of the Ontario manufacturing companies increased by $200,000,000, the number of employees by fifty thousand, the amount of wages paid by $55,000,000, and the total production by $210,000,000.

In Quebec, the number of establishments showed an increase of 1,619 in five years; the total capitalization $71,000,000; the number of employees, 39,000; the wages paid them $22,000,000, while the total production of the factories showed an increase of $131,000,000.

Alberta Ahead in Product Value.

The Province with the highest rate of increase in the value of products during the last ten years was Alberta, with 1,331 per cent.; the amount of increase being $17,500,000. During the same time, Manitoba increased in manufactured products by $41,000.000 or 315 per cent.; British Columbia increased by $46,000,000 or 235 per cent.; Quebec by $192,000,000, or 121 per cent.; Ontario by $338,000,000, or 140 per cent.; Saskatchewan by $5,680,000, or 871 per cent.

Fourteen Leading Cities.

Among the cities, Montreal continues in the first place as a manufacturing centre. In 1910, the value of manufactured products in Montreal proper was $166,000,000, an increase of 146 per cent. in twenty years. However, including Maisonneuve, Westmount, and Lachine, which are essentially a part of the Montreal industrial centre, the value of the production for the year was $115,000,000, which is an increase of 168 per cent. in twenty years.

The value of production in Toronto was $154,000,000, an increase of 234 per cent. in twenty years. Hamilton takes third place as a Canadian manufacturing centre, with a production of $65,125,000; Winnipeg is fourth with a production of $32,694,000; Ottawa fifth with $20,954,000; Quebec sixth with $17,149,000; London seventh with $16,273,000; Brantford eighth with $15,070.000; Vancouver ninth with $15.866,000; Halifax tenth with $12,140,000; St. John eleventh with $10,089,000; Sydney twelfth with $9,395,000; Berlin thirteenth with $9,266,000; Calgary fourteenth with $7,751,000.

FREIGHT RECORD THROUGH SOO CANALS.

MORE than ten million tons greater than the record of 1910, the previous best was the volume of freight carried through the canals at the Soo during the 1912 season, as shown in the statisical report just issued. While shipments of practically every commodity except soft coal show an increase over the three previous periods, the movement of iron ore, 46,303,423 tons, was greater by more than 4,699,789 tons, than in 1910, the season showing the greatest previous shipments.

Wheat.

The movement of wheat, 174,086,456 bushels, was 60,832,895 bushels greater than in 1909, while the total grain shipments show a gain of 12,505,095 bushels over the record of that year.

Coal.

Although the movement of hard coal was delayed in starting by mine difficul-

ties early in the season, the shipments, 2,142,485 tons, were 82,276 tons greater than the previous high record of 1911. The movement of soft coal, amounting to 12,789,109 tons, was 483,558 tons below 1911, due chiefly to delay in getting the product from the mines to the loading docks owing to car shortage.

Lumber.

Lumber shipments were 667,542,000 feet, a gain of 64,441.000 feet over the high record of 1910.

Passenger Traffic.

Passenger traffic shows a considerable falling off, the number carried through the canals, 66,877, having been 56 fewer than in 1910, and showing a loss of13,074 or 16 per cent., compared with 1911. For this, the unseasonable cold weather early in the year is held chiefly responsible.

Gossip of the Trade

Mr. J. H. Plummer, president of the Dominion Iron and Steel Corporation, who visited Montreal recently, announced that nobody would be appointed in the meantime to replace M. J. Butler, who resigned his position as general manager of the Dominion Iron and Steel Corporation.

St. Thomas, Ont.—The management of the Erie Iron Works have notified contractors of their intention to call tenders for the enlargement of their works. Much new machinery will be purchased.

Montreal, Que.—The taking over of the National Bridge Company, by the Dominion Bridge Company, although not yet ready for official announcement, is considered as good as accomplished. It is understood that the Dominion Bridge directorate will guarantee the interest on the $560,000 6 per cent. bonds of the National Company, and that the $5,000,000 National common stock will be exchanged at the ratio of one of Dominion for four of National. The directors of the National Company are Messrs. J. N. Greenshields, President; William Lyall, W. G. M. Shepherd, Hon. Robt. MacKay and H. W. Beauclerc. Mr. Jas. Ross is President of the Dominion Bridge Company, and is its largest shareholder.

St. Catharines, Ont.—The foundry plant of Steel & Radiation, Ltd., was formally opened here on November 29, by Sir Henry Pellatt, President, and the Vice-President, his Honor the Lieutenant-Governor, Sir John Gibson, in the presence of Mr. Frederick Nicholls and other directors, along with the Mayor and Council of the St. Catharines Board of Trade. Two hundred men are now employed at the new plant, which is situated on thirty-seven acres along the Welland Canal. The company expects soon to have six hundred men on the payroll. As a part of the ceremony, the first radiator ever produced in St. Catharines, was cast.

The Dominion Foundry Supply Co., Ltd., report an excellent year's business during 1912. Among other orders recently filled may be noted the following:

One No. 7 Whiting cupola for the Moffat Stove Co., Weston, Ont.

One No. 3½ Whiting cupola for Marsh & Henthorn, Belleville, Ont.

One No. 5 Whiting cupola, 2-ton pneumatic elevator and drawer type core ovens for the Canada Foundry Co.'s ornamental iron work foundry.

They have also just received an order for two No. 7 Whiting cupolas for the Standard Ideal Co., Port Hope, Ont.

The Dominion Foundry Supply Co., Ltd., also supplied all the overhead electric travelling cranes for the new shops of the National Steel Car Co., Ltd., at Hamilton, Ont. The order comprised five 10-ton and one 5-ton cranes. Two 10-ton travellers are now on order for the Pratt & Letchworth plant at Brantford, Ont.

The Michigan Central Railroad Co., St. Thomas, Ont., have in project a new shop with modern equipment which will be capable of taking care not only of present requirements but those of the future for a period of probably twenty years.

The Goold, Shapley & Muir Co., Ltd., Brantford, Ont., report that the year 1912 has been fully up to their expectations, being the largest so far as output is concerned in the history of their business. The prospects for the New Year 1913 are also exceedingly bright.

The E. B. Eddy Co., Hull, Que., are at present reconstructing their whole power system, and are installing an entirely new electrical plant. Construction has been going on for over a year and it is expected that another year will elapse before the whole work is completed.

The Smart-Turner Machine Co., Ltd., Hamilton, Ont., recently secured the following orders:—Mr. Wm. Bermingham, Goderich, Ont., duplex pump; Pratt & Whitney Co., Dundas, Ont., duplex pump; W. A. Mustard, Baysfield, Ont., rotary pump; Mr. Stephen Wellington, M.E., Madoc, Ont., duplex pump; The Breslau Brick Co., Breslau, Ont., duplex pump; L. H. Gouillard, East Angus, Que., centrifugal pump.

The Canadian Locomotive Co., Ltd., Kingston, Ont., report that since the improvements have been started in connection with their plant, the output has shown a steady increase. From the 1st of July up to December 3, thirty-seven engines of varied sizes and types were turned out, and the orders on hand at the present time indicate that every department will be fully employed until about next September.

The Russell Motor Car Co., Ltd., West Toronto, Ont., report that the year 1912, has been an exceedingly prosperous one for the company, a large production having been maintained at a fair profit. During that period, there has been erected on the premises a new factory four stories in height, 66 feet by 170 feet, which will provide accommodation for the employment of 300 additional men. A new office building has also been erected and opened at the factory.

Company Reorganized.—The Williams Mfg. Co. has been reorganized with a capital of $1,000,000. The company's products are sewing machines and typewriters, and additional capital is being secured in order to permit of extensions being carried out that will result in a much larger output than at present. Among the incorporators of the reorganized company are: Messrs. C. W. Davis, B. McLennan, James Rodger and William Yuile, Montreal, and Charles Tutton and Alexander Langlois, of Plattsburgh, N.Y.

Port Mann, B.C.—Announcement has been made by Col. A. D. Davidson, land commissioner of the Canadian Northern Railway, that arrangements are completed for the immediate construction of car building shops at Port Mann, B.C. The plans provide for machine shops, repair shops for cars and locomotives, storehouses, lumber sheds, yard, etc.

THE CHRISTMAS SPIRIT.

TO show their appreciation of the loyal assistance of their employes in making the past year a successful one, the board of directors of the **Union Twist Drill Co., of Athol, Mass.**, at a meeting held December 11, voted that the sum of 2 per cent. of wages earned during the past year be paid to those in the employ of the company, directly after January 1. The gift amounts to about one week's pay for those who worked full time throughout the year.

The same spirit of generosity was evinced by the **L. S. Starrett Co., of Athol, Mass.**, makers of the tools carrying the name of Starrett. In a circular to their employees they tell of the prosperity and progress of the past year, adding that their workers were appreciating the fact that quality of product was the chief thing, following which, came efficiency and loyalty. The directors have decided to pay each person employed by the company two per cent. of the wages earned during the year 1912.

Industrial News 146-148

OUR NEW YEAR ENTERPRISE.

THE publishers of Canadian Machinery extend to its advertisers and subscribers the season's greetings, and give expression to the hope, that a growing prosperity may continue to mark the dawn of each new day of the year 1913, over whose threshold we have just crossed.

With the development and progress of our country, it has ever been our aim to keep pace, and, in the many opportunities afforded to foster the work, our journal has always been in the forefront as a director and guide. The encouragement, support and commendation which we have received at the hands of all ranks and classes of the mechanical and industrial life of the Dominion during the past year impressed us with a realization that our place and sphere, the fitly filling of which, while highly appreciated, demanded enterprise equally aggressive, if not more so than the progress of the country itself.

It was therefore deemed expedient to mark the opening of the New Year, 1913 by a dual display of effort in the direction indicated. The first of this—the "Annual Review Number of Canadian Machinery," we have placed on record, and without particularizing, we believe it to be, notwithstanding fewer or many shortcomings, worthy of the confidence reposed in us, and an interesting and instructive production from cover to cover.

The second departure from previous arrangements consists in the decision to issue our journal weekly instead of monthly as heretofore. The developments in machinery manufacturing, in the establishment of railroad shops, iron and steel industries and large power plants throughout the Dominion, have, we believe, been such that the interests of both reader and advertiser will thus be better served. It had been our intention to have this weekly number follow directly after that of the "Annual Review," but consequent on some delay in the completion of our plans, and having regard to our practice and desire that our product maintain without question its high standard of excellence, we have decided to delay publication of the weekly issue until January 30th.

The usual mechanical features of the editorial section will be continued, and, in addition, two important departments, which will greatly broaden our field of usefulness, will be found in the weekly. One of these will contain a complete record of new developments, giving opportunity for the purchase and sale of general mechanical equipment. The other will consist of market reports on iron, steel, metals, machinery, etc. The weekly issue of our journal will be invaluable to plant superintendents, foremen and mechanical men generally, while the Industrial News and Market Reports will be of incalculatable benefit to manufacturers, their sales and purchasing departments.

The support, co-operation, and encouragement so generously meted out to us during past years is again claimed, and our confidence in the continuance of its receipt is unshaken.

REVIEW TOPICS CONTINUED IN NEXT ISSUE.

We have been reluctantly compelled to hold over till our next issue a considerable quantity of editorial material on account of lack of space. Articles dealing with "Workmen's Compensation," "Cost Systems," "Factory Design and Construction," "Efficiency, Its Methods and Application" and "Data Concerning Established and Budding Industrial Centres," etc., are some of the features of interest we have been unable to place at this time.

Personal

Mr. John McGill has been appointed assistant manager by the Berg Machinery Manufacturing Company, Toronto.

Superintendent White, of the Eastern Canada Power and Pulp Co.'s ground wood mill at Murray Bay, Quebec, has been appointed superintendent of the new one-hundred-ton ground wood mill, which will be erected by the Abitibi Pulp and Paper Mills.

T. R. Deacon, has just been elected mayor of Winnipeg. Mr. Deacon is a graduate of the University of Toronto in civil engineering of the class of '91, and is president and general manager of the Manitoba Bridge and Iron Works, Limited.

W. P. Ladd, Walkerville will be superintendent of manufacture of the superstructure of the large bridge which the Government is building across the St. Lawrence at Quebec, for which the St. Lawrence Bridge Co. has taken the contract. He has already been overseeing the building of the company's vast shops which are now near completion, situated near Montreal. The completed shops of the new bridge company will represent an outlay of over three-quarters of a million dollars. A start will be made on the bridge at the beginning of the year. William B. Fortune, who has had extensive experience in erecting large bridges in the United States, has been appointed general superintendent in charge of the construction of the St. Lawrence bridge.

Mr. W. Cook Hunter, of St. John, N.B. has been appointed manager of the Record Foundry & Machine Co., with headquarters at Moncton, N.B. Mr. A. E. Peters, the former manager and president, has retired from the management at his own request. Mr. Hunter was formerly a locomotive engineer on the I.C.R. and later air-brake inspector.

ADDITION TO EDITORIAL STAFF.

IN view of the fact that "Canadian Machinery," commencing with the issue of January 30, 1913, will be published weekly, additional editorial assistance has been requisitioned in the person of Mr. Chas. W. Byers, whose photograph accompanies this memorandum.

He is a man of dual experience, having been trained as an engineer, yet becoming a successful journalist. He is an engineer by accident. Born in the village of Codnor in Derbyshire, near the beautiful Peak district of England, he passed through the public schools, and won a scholarship for three years at the Heanor Technical Schools. His course completed there, he expressed a wish to go into the newspaper field, but his parents, knowing somewhat of the precarious nature of this calling, decided to fit him for other work, with the privilege of taking up journalism later if he wished. That is why Mr. Byers is with the MacLean Publishing Co. to-day.

He was sent to Nottingham University to study engineering under Professor William Robinson, author of "Gas and Oil Engines," with the understanding that if he could work his way through the full course, his people would pay his fees for the first year. He won two scholarships there, and graduated in 1906.

In June of that year, Mr. Byers sailed for the United States, where he obtained his first position with the Sullivan Machinery Co., manufacturers of mining machinery, Claremont, N.H. After seven months of hard work in their shops, he was sent to operate their coal-cutting machines at Wind Rock, Tennessee. For eight months he worked in and around various mines in the Southern States, and returned north in the winter of 1907 to Cincinnati, Ohio, obtaining a post with Allis-Chalmers & Co. in their electrical shops.

CHAS. W. BYERS,
Editorial Staff, "Canadian Machinery."

In 1908 he visited his home in England, and, on returning, worked for several months in the shops of the Vermont Farm Machinery Co. at Bellows Falls, Vt. It was while here that the Semet-Solvay Process Co., with whom Mr. Byers had been associated in Ensley, Ala., made him an offer to go to Detroit, there to conduct tests on their coke ovens, with a view to taking charge of a battery of new ovens which they were erecting. He accepted the post, and was with the company the greater part of 1909.

As winter approached, a temptation came to enter the journalistic field. Up to this time, Mr. Byers had never seen the editorial sanctum. He came to Toronto, and not meeting with success on any of the city papers, went to Ottawa, where the "Evening Journal," seeing what an able writer he was, engaged him. His rise was rapid, and in a few months he was one of the "Journal's" most expert men. In August, 1910, the Hamilton "Spectator" offered him a larger salary to go there. He went, and made a name for himself in journalism.

In the summer of 1911 he went over to England for the coronation, and returned in September, just prior to the general election. Because of his knowledge of the French language, he was given a place on the editorial staff of the Montreal "Daily Witness," before long being appointed telegraph editor. Later he became assistant to the city editor.

After eighteen months with the "Witness," Mr. Byers accepted the position of associate editor on "Canadian Machinery," there to unite his knowledge of engineering with his ability to write.

On leaving the "Witness" early in December, Mr. Byers was presented with a handsome gift by the members of the editorial staff.

Prack & Perrine, Industrial Architects and Engineers, Hamilton, Ont., report a very busy and successful year, having designed and constructed new plants and extensions for the following concerns:—Brown, Boggs Co., Hamilton; Petrie Mfg. Co., Hamilton; Dominion Steel Castings Co., Hamilton; Canadian Westinghouse Co., Hamilton; International Harvester Co.. Hamilton; Oliver Chilled Plow Co., Hamilton; The Mueller Co.. Sarnia; Russell Motor Car Co.. Toronto.

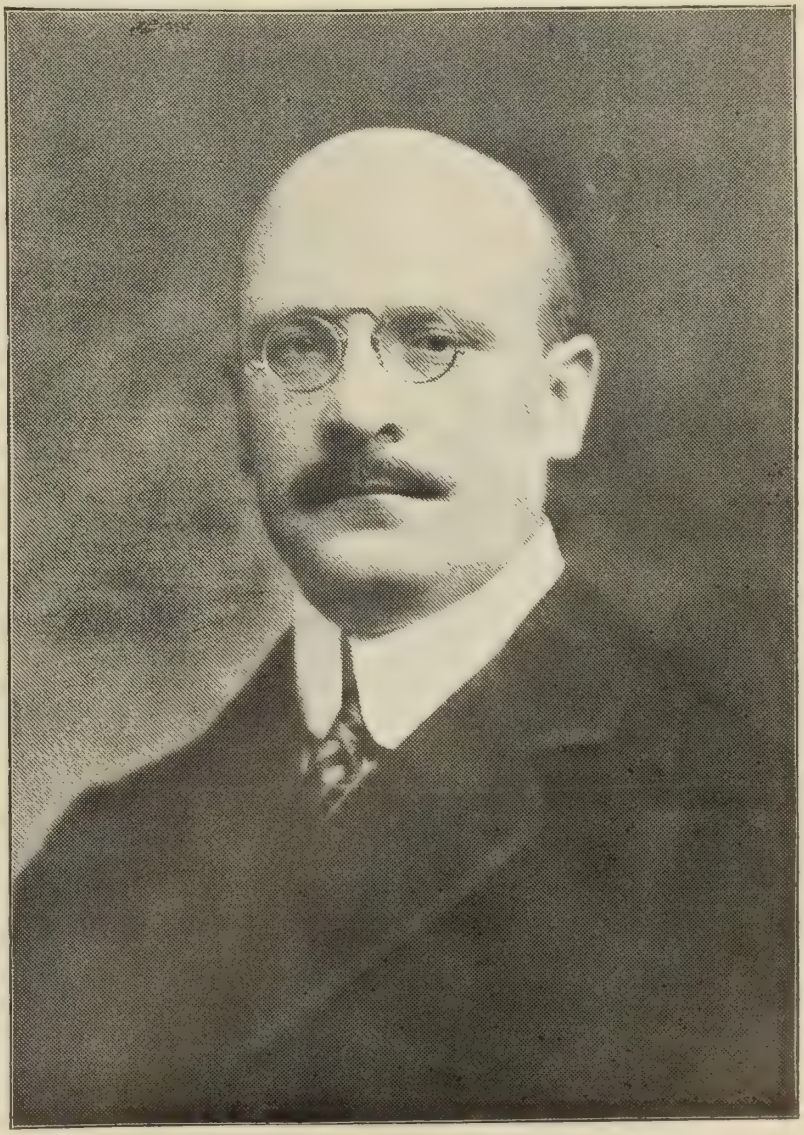
In addition to the above (all of which are metal working concerns), they have been responsible for the design and construction of buildings for several other large commercial firms, both in Canada and the United States.

..**Mr. Harry Davis,** late of Geo. T. Fuery Co., of Birmingham, England, who has had sixteen years' patent experience in Europe, the United States, at Washington, and in Canada, will take charge of the English branch of the firm of patent solicitors, Messrs. Pigeon & Pigeon, of Montreal. It is due to Mr. Davis' personal merits and ability that he enters the firm, which will henceforth be known as Pigeon, Pigeon & Davis. Owing to the steady increase of business, Messrs. Pigeon & Pigeon have been compelled to entirely re-organize and increase their staff.

NEW GRAIN ELEVATOR FOR THE MONTREAL HARBOR COMMISSION.

THE marine traffic of the port of Montreal is second only to that of New York among all the ocean ports of North America. An important portion of the export traffic from Montreal is grain, which is, for the greater part, wheat from the Western Provinces of Canada.

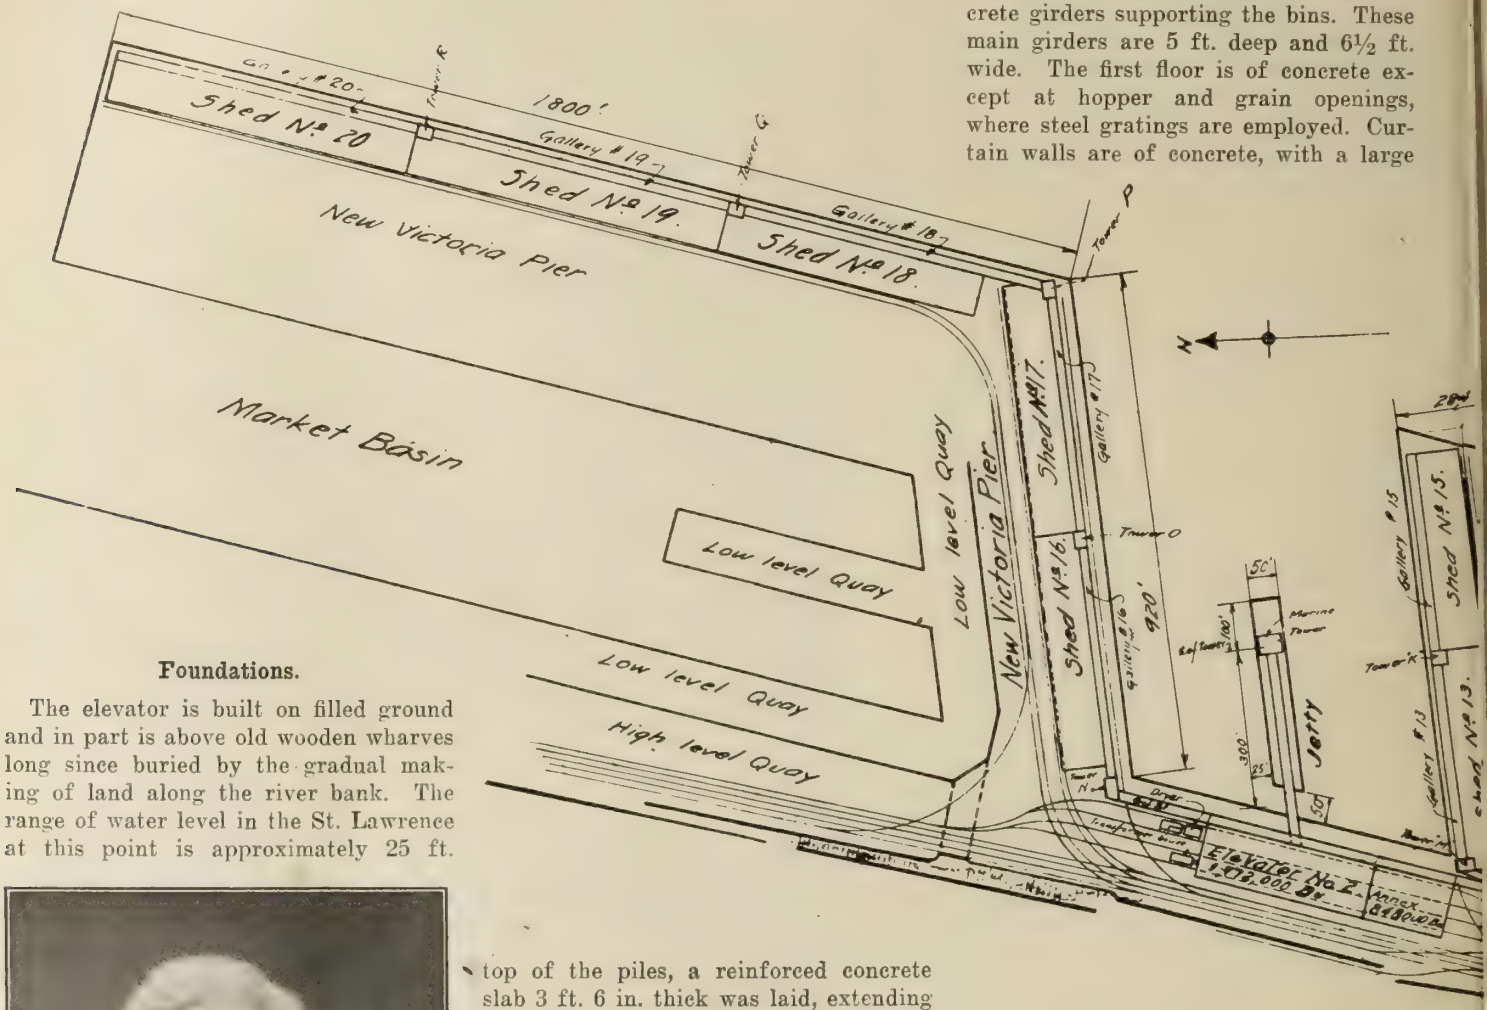
Equipment prior to 1910.



Prior to 1910 the export grain handling equipment in Montreal Harbor consisted of a 1,000,000-bushel steel elevator, owned and operated by the Harbor Commissioners, and adapted for unloading lake and canal vessels, but not designed for extensive railway car traffic; a 1,000,000-bushel steel elevator, owned and operated by the Montreal Warehousing Co. (a corporation subsidiary to the Grand Trunk Railway), equipped for the unloading of both railroad cars and inland vessels; two obsolete wooden elevators, owned by the Canadian Pacific Railway, and since torn down; and a small fleet of floating transfer elevators of varying age and efficiency.

The New Elevator and Its Purpose.

In the early part of 1910, the Harbor Commissioners determined on the immediate construction of a new grain elevator of the highest class to provide (a)—a rapid and efficient plant for the unloading of those railway cars for which the Grand Trunk elevator was not available; (b)—extensive additional capacity for quick unloading of inland vessels, which were often delayed for days in the harbor waiting to be unloaded; (c)—sufficient additional storage capacity so that merchants could hold grain at the exporting point when it became advantageous to do so, and to eliminate the necessity for direct, or almost direct transfer of inland cargoes to ocean vessels; (d)—facilities for shipping grain from the new elevator not only to the present vessel berths but to others being planned.



The Harbor Commissioners retained John S. Metcalf Co., Ltd., as their constructing engineers for the new elevator, and being the designers and builders of the Grand Trunk elevator in Montreal Harbor, and of the great export grain conveyor system belonging to the Commissioners, they were familiar with the development of the port and the details of the problems to be solved. The instructions were to provide the best in structure, equipment and efficiency, because the Commissioners were resolved that Montreal's export traffic in grain should not suffer through lack of thorough facilities. In the summer of 1912 the elevator and a portion of the shipping conveyors were ready for the handling of car grain; and the marine unloading equipment went into operation during October.

Even though the capacity of the new elevator was to be 1,772,000 bushels, it was found in 1911 that the storage room of the port would still be inadequate; and as the elevator was to have ma-

GEORGE WASHINGTON STEPHENS,
Late Chairman Montreal Harbor Commission.

chinery equipment suitable for taking care of several millions of bushels of storage capacity, the Commissioners ordered the capacity to be increased by 850,000 bushels, making the total capacity of the new work 2,622,000 bushels. The storage addition was ready for grain last fall. A description of the important features of the work follows, the general dimensions, including the storage addition, being 456 ft. 8 in. long by 100 ft. wide and 220 ft. high to the tops of the leg towers.

Shipping Conveyor Gallery System
12512 ft of Galleries = 2⅜ miles
55953 ft of belt = 10½ "
207 dock spouts
58 Trippers

Foundations.

The elevator is built on filled ground and in part is above old wooden wharves long since buried by the gradual making of land along the river bank. The range of water level in the St. Lawrence at this point is approximately 25 ft.

F. W. COWIE, B.A. Sc. (McGill),
Chief Engineer, Montreal Harbor Commission.

The rail elevation is at high water level, but to provide for deep receiving pits it was necessary to carry a considerable portion of the excavation for the main elevator down to a depth of about 20 ft.; accordingly the entire area of the main building was excavated to low water level and 7,730 wooden piles were driven. The driving was found to be exceedingly difficult owing to the boulders, old cribs, etc., beneath the site. Two large drivers with No. 1 Warrington steam hammers were employed. On top of the piles, a reinforced concrete slab 3 ft. 6 in. thick was laid, extending over the entire foundation area. An idea of the foundation problem may be gained when it is known that loads as high as 1,270 tons had to be carried on some of the columns. Concrete piers and walls were built on top of the foundation slab and carried up to the track level. The track girders are of reinforced concrete, except over the receiving pits, where they are of steel. Boot tanks and track hoppers are of steel.

The foundations of the 850,000-bushel storage addition were differently treated. As there were to be no elevator legs, and consequently no boot tanks, in this portion of the elevator, the deep excavation necessary for the main elevator was not required, consequently, 1,535 reinforced concrete piles were used. These were of the Simplex moulded inserted type, with their tops about four feet below base of rail. Above them the foundation concrete was placed.

First Storey.

Four railroad tracks extend through the entire elevator. The bin openings are 22 ft. 6 in. above the tracks. The columns supporting the bins are of reinforced concrete, about 24 ft. centres, in general, each way. Some of these columns are as large as 6½ ft. by 5½ ft. They are surmounted by the heavy concrete girders supporting the bins. These main girders are 5 ft. deep and 6½ ft. wide. The first floor is of concrete except at hopper and grain openings, where steel gratings are employed. Curtain walls are of concrete, with a large area of fireproof windows. The track openings are closed by rolling steel doors.

Capacity and Construction of Bins.

The bins, of reinforced concrete, are rectangular in form, and 86 ft. deep. Bin walls are in general 8 in. thick. Bin capacities range from 6,800 bushels to 14,300 bushels, and the total number, exclusive of shipping bins, is 278. Along the water side of the elevator, the upper

portion of each bin is used as a shipping bin. An intermediate concrete bin bottom is placed about mid height of the latter, the upper portion discharging to the shipping conveyors, and the lower portion being used as an ordinary storage bin.

L. E. GEOFFRION,
Late Member Montreal Harbor Commission.

The bins were constructed by the use of moving forms, which were raised by nuts working in jack castings attached to them, the nuts travelling on threaded rods set vertically in the concrete walls. Rapid progress was made in the building of the walls, the height of 86 ft. in the storage addition being run in less than fourteen days, day and night work. The bin bottoms are of reinforced concrete, in part supported directly on the bin girders and in part suspended from them. Each bin opening is provided with a cast iron and steel revolving turnhead, with rack and pinion valve opened and closed from the floor below.

Cupola.

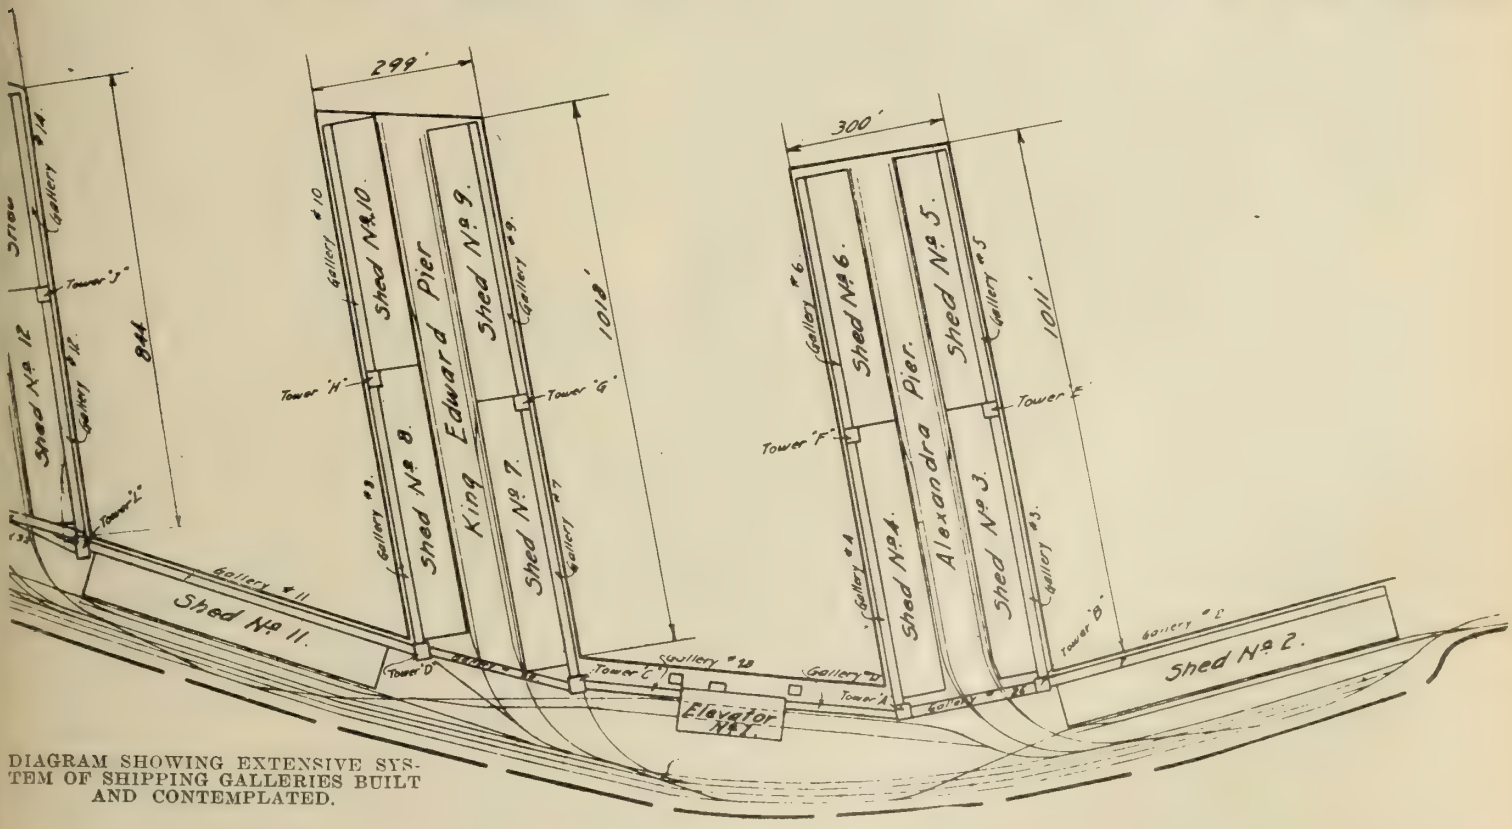
The cupola construction is a remarkably fine example of reinforced concrete. Columns, girders, floor and roof beams, wind bracing, stairs, curtain walls, floors and roofs are all of concrete. In fact, only in the case of machinery supports has structural steel played any important part. The lower sides of floor and roof beams are cambered. Curtain walls are 2½ in. thick, supported at short intervals by concrete ribs connecting to the floor beams. Windows are of fireproof type. Roof covering is of tar, felt and gravel, except on the leg towers, where the concrete is waterproofed and covering omitted.

The cupola is 107 ft. high above the bin walls and 220 ft. above the base of rail. This means that there are very few, if any, higher reinforced concrete buildings in existence. Above the storage addition, the cupola is but two stories high, as the only machinery above those bins is the conveyors and spouts for filling the bins.

Marine Tower.

A marine tower for unloading boats is placed on a jetty projecting into the neighboring slip. The tower is so placed in order that two vessels may be unloaded simultaneously, one lying along each side of the jetty. The tower is 340 ft. from the elevator. It is built of structural steel, this material being adopted instead of concrete because it is expected that, in the event of the Georgian Bay Canal being built and 600-ft. vessels being brought to Montreal for unloading, it may be desired to extend the jetty farther and move the tower to

C. C. BALLANTYNE,
Late Member Montreal Harbor Commission.



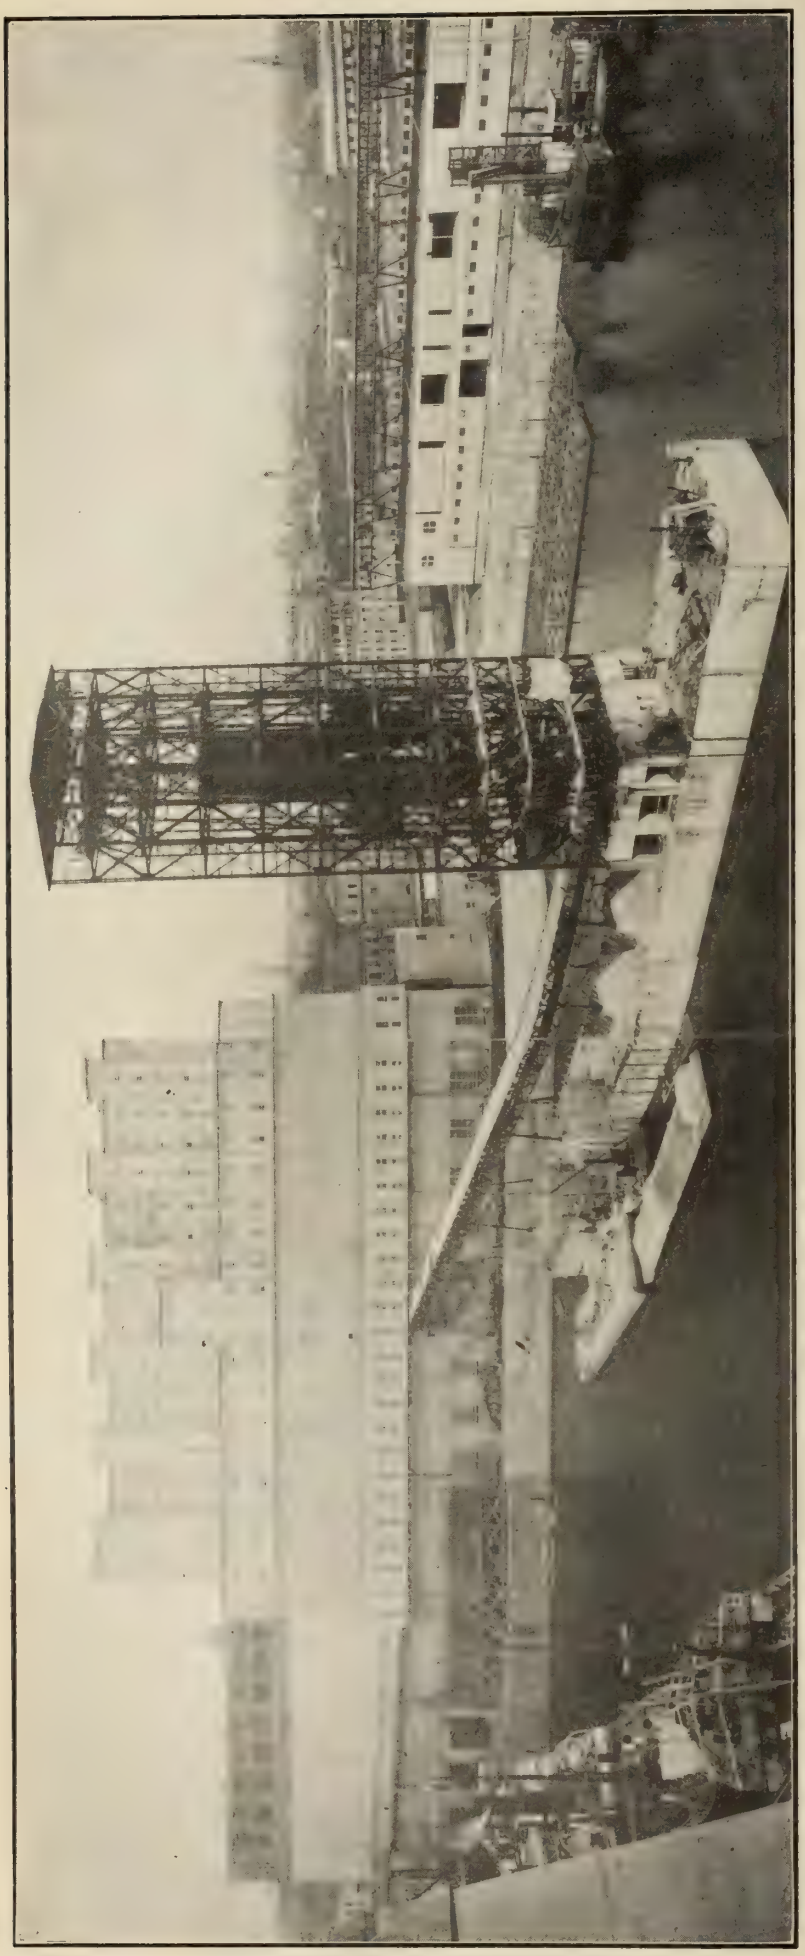


DIAGRAM SHOWING EXTENSIVE SYSTEM OF SHIPPING GALLERIES BUILT AND CONTEMPLATED.

NEW GRAIN ELEVATOR FOR THE MONTREAL HARBOR COMMISSION. VIEW FROM JACQUES CARTIER PIER.

such a distance from shore that 600-ft. vessels may be unloaded without interference. As the shorter jetty is, however, better adapted to present congestion in the harbor, it has been adopted until such time as the increased size of lake boats coming to Montreal shall require its extension. A steel gallery runs from the marine tower to the elevator, and contains the conveyor belts for taking grain received by boat to the elevator.

Shipping Conveyor Galleries.

Study of the accompanying diagram will show the extensive system of shipping galleries built and contemplated. Those already built in connection with elevator No. 1 were two miles in extent. Those to be added in connection with elevator No. 2 will bring the total to 2½ miles, using 10 miles of rubber belt. All galleries are of steel with concrete floors and roofs and corrugated steel side-covering.

Miscellaneous Structures.

A reinforced concrete building is provided for a grain dryer and its boiler plant, and a similar structure for the transformers and switchboard.

Receiving Equipment from Cars.

There are 4 receiving tracks, 24 track hoppers and 12 receiving legs. Each leg is fed from two hoppers, one on either side, interlocking being used so that it is impossible for grain to reach the leg from more than one hopper at a time. Track hoppers are of large size, and a pair of power shovels is provided at each. Thus, the unloading of a car on one side of the leg is independent of that on the opposite side, and unloading from both cars may proceed simultaneously, as the legs are of sufficient capacity (12,000 bushels per hour each) to quickly elevate the contents of either hopper as soon as the elevation of the contents of the other has been completed.

The elevator will receive 240 cars in ten hours with the ordinary complement of men, and with extra men can better this in emergencies. Cars are handled by heavy carpullers using ¾-in. wire cable. Each receiving elevator discharges to a 2,500-bushel garner over a 120,000-lb. Fairbanks hopper scale, whence the carload is sent by spouts, or belt conveyors and spouts, to the desired bin.

Receiving Equipment from Boats.

The marine tower is equipped with two marine legs, each of 20,000 bushels hourly capacity on the dip. One leg operates on each side of the tower, so that two boats may be unloaded simultaneously. The grain from the legs is

weighed by two pairs of 6,000-lb. Fairbanks continuous automatic weighing machines. Complete ship shovel and clean up shovel apparatus, operated by air, and the best of equipment for raising and lowering the legs, and adjusting them horizontally to the position of the boots, is provided. The marine legs are of steel, 115 ft. long between centres of pulleys, and are the longest marine legs ever constructed.

Two 40-in. belt conveyors carry the

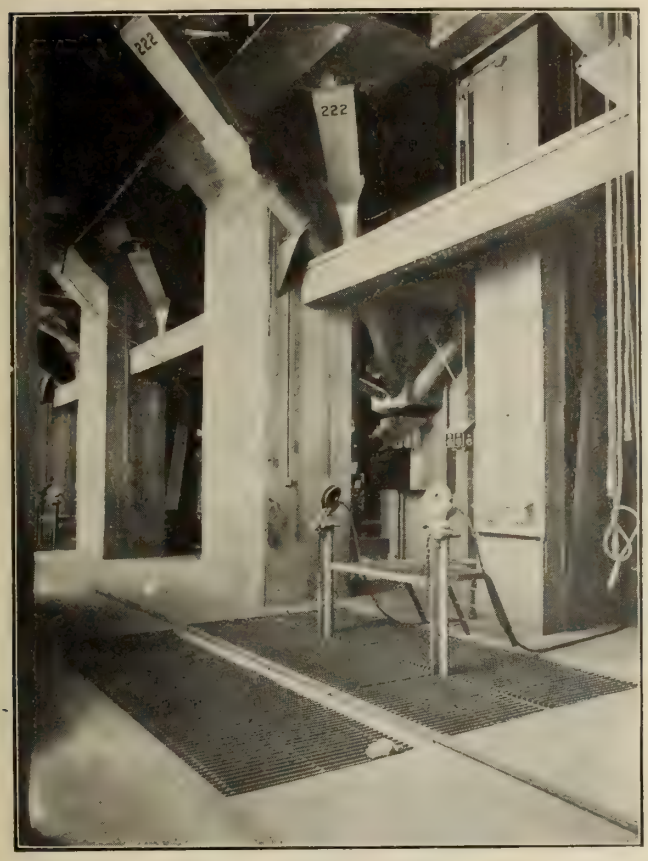

FIG. 3. FIRST FLOOR.

FIG. 9. DRIVE TO RECEIVING ELEVATOR LEG.

FIG. 4. DISTRIBUTING SPOUTS. STOREY OVER BINS.

FIG. 11. MAIN SWITCHBOARD.

grain to the elevator, where two lofter legs elevate it to the cupola. There, a system of 40-in. belt conveyors distributes it to the double jointed spouts leading to the bins. The maximum hourly capacity for receiving from boats is 40,000 bushels.

FIG. 5. BELT CONVEYORS IN SECOND STOREY OVER BINS.

Distributing.

Two reversible longitudinal conveyors in the cupola receive from the scales and distribute grain longitudinally.

Cleaning.

While Montreal is not a cleaning point, two large steel cleaning machines are provided for emergency cleaning and separating.

Shipping to Cars.

Four car-loading spouts are provided so that cars may be loaded if desired. This sometimes becomes necessary in order to get grain to a winter port farther east after the port of Montreal has closed.

Shipping to Ocean Vessels.

In connection with elevator No. 1, the shipping conveyors serve 14 vessel berths on King Edward, Alexandra and Jacques Cartier piers and the neighboring shore wharves. Five berths are being added on the new Victoria pier. The side shipping gallery of elevator No. 2 contains six shipping conveyors. Two will extend north to serve the Victoria pier, and four will run south to connect with the conveyors to the present 14 berths. It will be possible for either elevator to ship to any of the 19 berths. The shipping system of elevator No. 2 will be served by five shipping legs each with a capacity of 16,000 bushels per hour. The total shipping capacity of elevator No. 2, starting with the shipping bins full, will be 90,000 bushels hourly for ten hours.

Grain for shipment by boat is weighed through five pairs of 5,000-lb. Fairbanks automatic weighing machines, each provided with automatic registers, printing devices and electrical counters in the weighman's office. As shipping to boats and receiving from boats are continuous operations, automatic scales are used for this work, but as it is necessary in receiving from cars to keep each car weight separate, hopper scales are employed for car receipts.

Drying.

A Hess drying plant with a capacity of 5,000 bushels per day is included in the equipment. This has a separate leg so that interference with the main receiving and shipping legs is avoided.

Power.

All power is supplied by electric motors of the induction type. In the elevator, marine tower and the new shipping galleries, the motors number 80, and total 4,680 h.p. An ingenious and efficient system of electric signals controls the operation of elevator legs and shipping conveyors. When the extent of the shipping system is remembered, and the interconnection of the two elevators, it will be seen that the signal system, particularly for shipping, must be instantaneous and sure. Its design was accomplished with credit.

FIG. 2. FIRST FLOOR.

General.

The Harbor Commissioners' grain storage and shipping system will now consist of:—

Two grain elevators with two marine legs each, and a conveyor system by which grain can be delivered from either elevator to any of 19 steamer berths. Everything is of fireproof construction and all machinery is electrically driven. There is a storage capacity of 3,620,000 bushels and contemplated

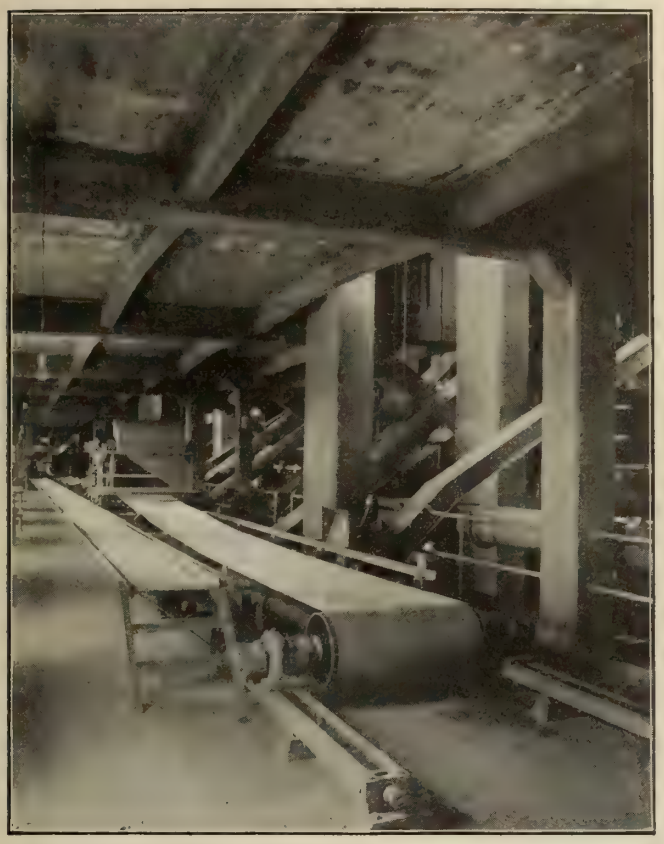

FIG. 6. BELT CONVEYORS IN SECOND STOREY OVER BINS.

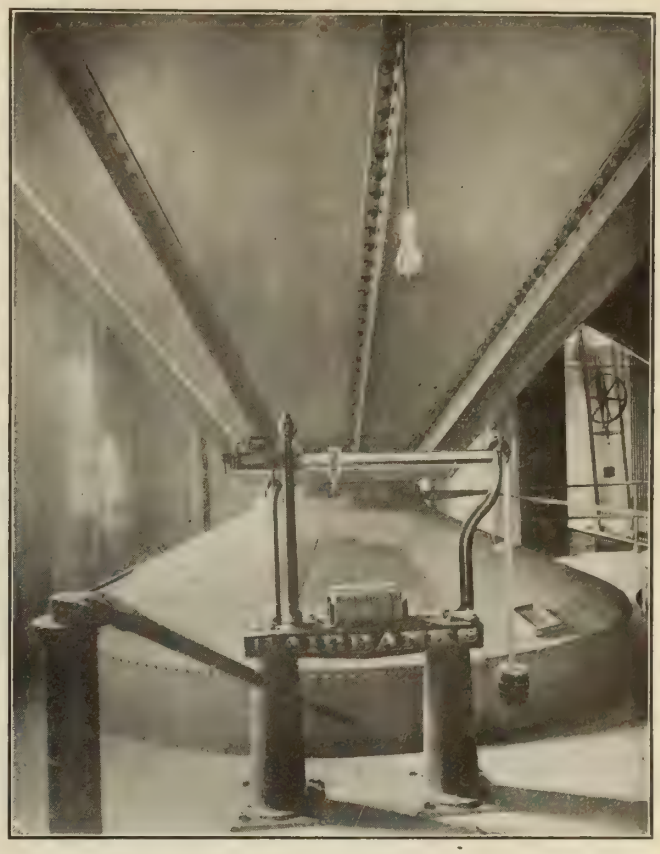

FIG. 7. 2,000 BUSHEL HOPPER SCALE.

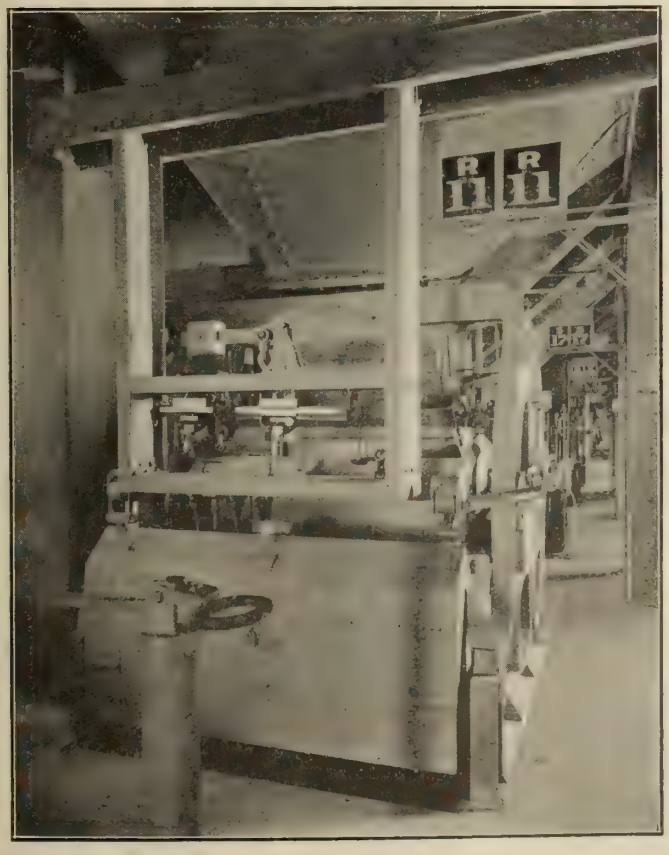

FIG. 8. AUTOMATIC WEIGHING MACHINE. 5,000 LBS. PER DRAFT.

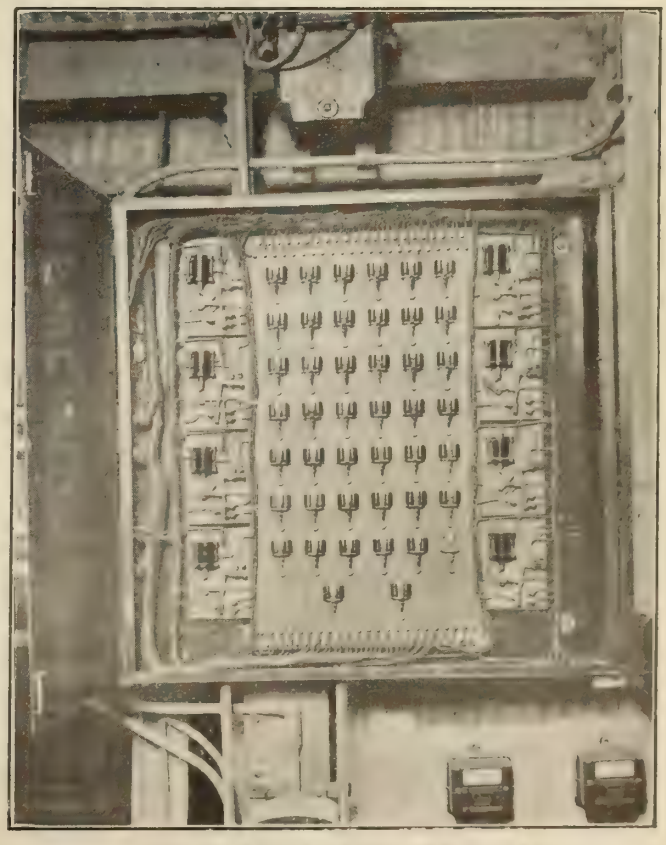

FIG. 12. RELAY PANEL FOR SIGNAL.

extensions for 3,790,000 bushels more; total 7,410,000. Grain may be received from cars at a rate of 33,000 bushels per hour, and at the same time from boats at a rate of 55,000 bushels per hour.

Grain can be shipped by conveyor system to ocean steamers at their regular berths at a rate of 150,000 bushels per hour, equal to 4,500 tons per hour. It is possible to deliver grain to five steamers at the same time at a rate of 30,000 bushels per hour each, or it is possible to deliver to 10 steamers 15,000 bushels per hour each, at the same time. The present conveyor system comprises two miles of conveyor galleries and over eight miles of rubber belting, in addition to this there is under construction another half mile of gallery with two miles of rubber belting.

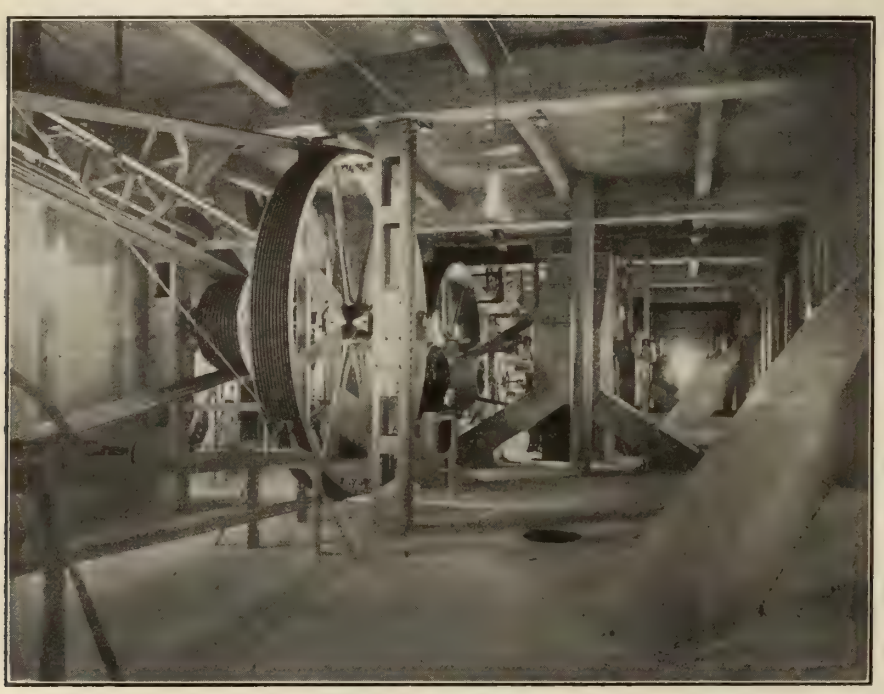

FIG. 10. TOP FLOOR. ELEVATOR HEADS AND DRIVES.

The constructing engineers for the Montreal Harbor Commissioners were the John S. Metcalf Co., Ltd., Montreal, under Mr. F. W. Cowie, chief engineer. This company were also the designers of the conveyor system in connection with elevator No. 1. It is easy to say that this building or that building is the best ever built, and that this elevator or that elevator can handle more grain than any other; the Harbor Commissioners responsible for the new work, Messrs. Stephens, Ballantyne and Geoffrion, with Mr. David Seath, secretary, are content to let the elevator and accessories speak for themselves.

C.N.R. MOUNT ROYAL TUNNEL, MONTREAL.

THE members of the Canadian Railway Club, Montreal, were given some interesting details of the Mount Royal Tunnel, by the managing engineer of the new undertaking, Mr. S. P. Brown, who lectured before them recently.

"The designs for the Mount Royal Tunnel," said Mr. Brown, "are not yet completed, but it is probable that both twin tunnels and double track sections will be used, depending on the ground. Where the rock is of the proper character to permit it, the tunnel may be left unlined, although this cannot yet be determined. The minimum clearance has been limited to 16½ feet above the rail, but the standard tunnel clearance will be 17½ feet. In the twin tunnel, center walk ways will be provided at about the level of the coach floors, and cross passages will be cut through the dividing walls, at intervals, for communication between the two tubes. In the double track section, the two tracks will be separated by a duct bench, so that in case of derailment one train cannot block both tracks.

Electrification.

Just how the line will be electrified is another question that remains to be settled. Owing to the climatic conditions outside the tunnel, Mr. Brown said that it is improbable that a third rail will be used on the ground, therefore, the adoption of some form of trolley will become necessary. This means high voltage, either direct or alternating current. Great strides have been and are now being made in high voltage, direct current railway work, and until very careful and exhaustive studies have been completed, no decision can be made.

Excavation Progress.

With regard to the progress that is being made in excavating the new tunnel; the engineer in chief appears to be satisfied. At present, he said, the average progress at the west end is 20 feet per day. In the east end, where the ground is rather bad, requiring timbering, and where no shooting is allowed at night, on account of public annoyance, the average progress for the last two months was 12 feet per day.

Possibilities of a Second Tunnel.

Will the future see the traffic in Montreal so heavy that a second tunnel, built above the present one, and carrying only rapid transit passengers, will be required? Mr. Brown evidently believes that it will. The grades and elevations are such, he said, that this tunnel passes under St. Catharine street with ample room for a future rapid transit subway above it, and the tracks are able to be carried level through the station and over the lower town on the proposed viaduct, where a yard for light and perishable freight is contemplated, to connect with the proposed Harbor Commissioners' elevator and a possible bridge across the St. Lawrence River.

Passenger Stations and Yards.

From the main passenger station, the speaker said, two tracks will run both east and west. The tunnel is something over three miles long, and the viaduct about one mile long. The passenger station yard will be about a quarter of a mile long, with platforms over 1,000 feet long, and an area of about nine acres. Local passenger stations will be situated down town and back of the mountain, as traffic demands. The main yard will be located near the Back River, where the electrical transfer yard will also be situated. There will also be a delivery yard in Mount Royal, and an elevated yard in the commercial part of Montreal.

THE TRANSCONA SHOPS OF THE N. T. R.

UNDOUBTEDLY the most important railway plant completed during 1912 was that of the National Transcontinental Railway at Transcona, Man., the locomotive shops of which were finally completed at the end of May. A complete illustrated description of such of the buildings as had then been erected, together with full details as to their equipment, was published in "CANADIAN MACHINERY" in July of last year, and to that article readers who wish full particulars are referred. A short part of it is here reproduced, with certain additional matter.

General Layout.

The shops are located on the prairie, six miles east of Winnipeg, and the

whole area occupied by the buildings and tracks has been covered by a heavy gravel fill, 3 feet 6 inches deep, in order to raise the shop floors sufficiently above prairie level, to avoid all trouble from flooding in the spring. The whole property is 2½ miles long by ½ mile wide, and the total floor area of the shops when completed will be rather more than 17 acres. The plant has been designed to allow of a future extension of 100 per cent., and always keeping this in view, the grouping of the shops has been arranged as completely as possible in order to facilitate intercommunication in winter.

As in the majority of large railway plants of modern design, the various buildings are situated on either side of a spacious midway. The latter is 1,200 feet long, and runs north and south; a public road terminating it at the north end, while the locomotive roundhouse is located at the south end. It is served by a 10-ton electric traveling crane of 73 feet span, and by industrial and standard gauge tracks. The crane has a traveling speed of 400 feet per minute, enabling material to be rapidly handled between the various shops. It has two hoisting speeds of 15 and 40 feet per minute respectively. The motors, gears, etc., are covered in as a protection against the weather, and the operator's cage is electrically heated in winter. The height of the crane rails above level is 28 feet.

The power house stands about half way along the midway on the west side, thus occupying a central position for the distribution of power, light and heat. A track, running at right angles to the midway, immediately north of the power house and forge shop, forms, roughly speaking, the dividing line between the locomotive and the car departments; the latter lying to the north and the former to the south.

Extending the full length of the midway there is a 5 ft. x 6 ft. tunnel to accommodate the high and low pressure steam pipes and returns, together with the compressed air lines, etc. Tile conduits branch off to the various shops, and a short subway connects the tunnel with the power house. In this way the various pipe lines are distributed throughout the plant. An auxiliary chamber runs outside the tunnel and carries the electric cable conduits which are embedded in concrete, and at convenient intervals open into chambers accessible from the tunnel by means of doors.

Shop Lighting.

The general system of interior illumination is by Cooper-Hewitt A.C. mercury-vapor lamps of 700 C.P. each. Connections are also provided for incandescent drop lights and extension cables. A 600-volt feeder runs the full length of the midway tunnel with sub-feeders to transformers outside each shop. These reduce pressure from 600 to 200 volts to suit the mercury-vapor and incandescent lights.

The midway and yards are lighted by Westinghouse series enclosed arc lamps. In the midway, these are carried from the crane runway, while in the yards they are supported by iron brackets on poles.

Details of Shop Construction, Foundations, etc.

Except in the case of the storehouse, stores platform and oil house, the buildings all have self-supporting steel frames standing on reinforced concrete footings. These are carried down 11 feet to the clay, and are of such a size that the pressure per square foot in no case exceeds 5,000 lbs. The walls are of concrete up to the window sills, and rest on wide concrete footings. Above the window sills, the walls are of white brick, carried up into a parapet wall on all four sides of the building and topped off with a coping of concrete. The roofs are mostly covered with tar felt and asphalt, coated with gravel. All windows are of ⅛-inch ribbed glass set in wooden sashes. The skylights are supported by ¼ x 3 inch steel ribs, and are of ⅜-inch wire glass, carried by rolled copper sheathing. Rainwater, etc., is collected on the roofs in copper receiving hoppers and brought down inside the buildings by wrought iron pipes to the sewers. The shop floors are of3-inch planks spiked to 4 x 6 inch timbers, bedded in bituminous concrete.

The locomotive erecting and machine shop forms the largest building, it measuring 615 x 170 feet. It is divided into three bays, 70 ft., 60 ft., and 40 ft. wide, respectively. The 70 ft. bay forms the erecting shop and has twenty-five tranverse locomotive pits served by a 120-ton overhead crane, below which there is a 10-ton messenger crane. The other two bays form the heavy and light machine shops, the 40 ft. bay having a gallery overhead on which are located the tin shop, brass finishing shop, air brake department and toilet rooms.

The boiler and tank shop measures 180 ft. by 205 ft., and the forge shop 260 x100 ft. Both are very fine examples of what such shops should be and are splendidly fitted out in every way, the crane equipment being especially good.

The Power House.

The whole plant is operated, lighted and heated from its own power house situated at about the centre of the site. This building is 150 x 110 ft. and is divided into the usual boiler house and engine room. Steam at 150 lbs. pressure is raised in eight water tube boilers, rated at 425 H.P. each. These are of the Erie City vertical tube type. Six are fitted with automatic stokers while the other two are hand fired and will eventually consume all shavings and waste lumber from the planing mill.

The engine room contains four A.C. steam driven generators, one D.C. ditto, a motor generator set and two independent steam driven exciter units, the nominal total capacity being 2,050 K.W.

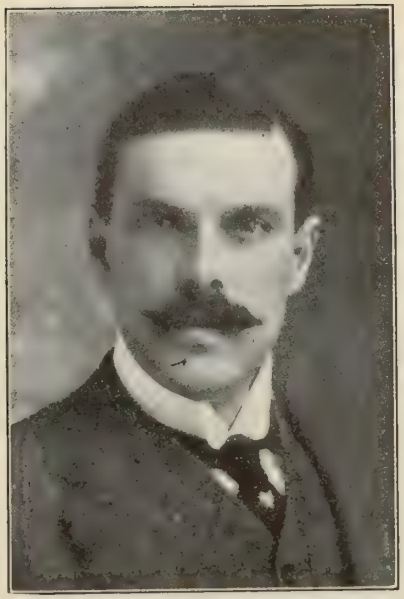
The boiler feed pumps, fire pumps and other auxiliaries are accommodated in a pump pit at the foot of the wall dividing the engine room from the boiler house.

The Grey Iron Foundry.

This building is 200 ft. long by 130 ft. wide, with an annex 60 x 80 ft. for the cleaning department. The main bay is served by a 15-ton electric crane fitted with a 5-ton auxiliary hoist. One of the side bays of the shop is occupied by the toilet room and a small brass foundry, while the opposite bay accommodates the bench moulders, core makers and cupola room. A feature of the layout is that all storage bins are under cover, so that it is never necessary to go out into the open for raw material—a great advantage in severe weather.

The Car Department.

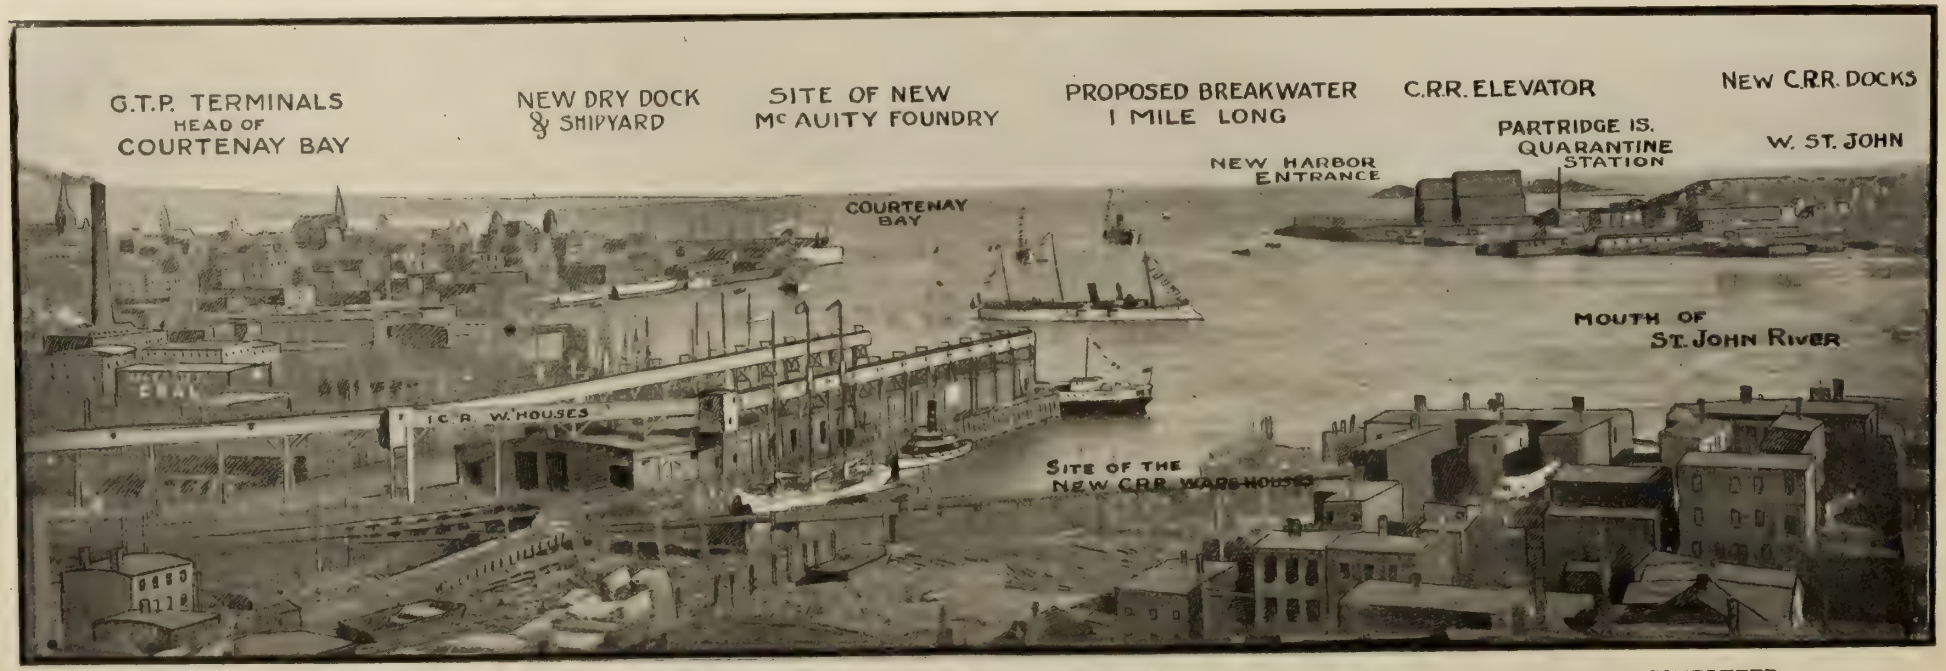
The car shops are now rapidly nearing completion and the equipment is understood to have been finally decided upon.



The largest building is the freight car shop which measures 600 x 200 ft. Here will be built both wooden and steel cars. The steel car bay is served by a 10-ton traveler and the wood car bay by a 20-ton traveler equipped with a 5-ton auxiliary hoist.

The wheel and machine shop is on the east side of the midway next to the forge shop, and is served by a 10-ton traveler. The machine tools here include three 42-inch car wheel boring machines, two double axle lathes, two 42-inch coach wheel lathes, and other first-class equipment.

There are two coach shops arranged on either side of a transfer-table pit and parallel with the midway, across which the cars pass on their way to the paint shop. The latter is a spacious and well lighted building measuring 250 x 125 ft. Alongside it is the planing mill, 220x125 ft., equipped with the most modern wood-working machinery. All machinery is being supplied to very rigid specifications and will be of the same high-class as that already installed in the locomotive shops.



P. R. WARREN,
Chief Engineer the Norton Griffiths Co., Ltd. (Canada).

President the Norton Griffiths Co., Ltd. (Canada.)

W. BURTON STEWART
Managing Director, the Norton Griffiths Co., Ltd. (Canada.)

HARBOR OF ST. JOHN, N.B., AS IT WILL APPEAR WHEN THE DOCKS, WHARVES, BREAKWATER AND RAILROAD TERMINALS ARE COMPLETED.

Development of St. John, N.B., as an Ocean Port

By C.T.R.

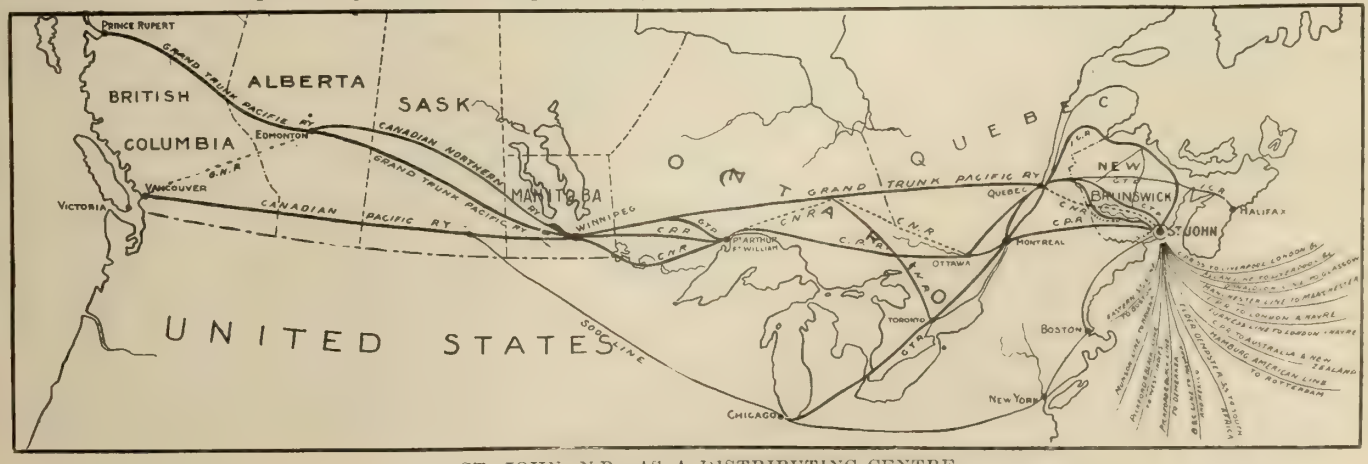
It is abundantly evident that the next decade will witness the rise into prominence of this old-time city as the Dominion's leading port on the Atlantic Coast for winter freight and passenger service. Some there are who predict for it the flattering cognomen of "The Liverpool of Canada," and if railroad, dock and harbor developments are a criterion, we are disposed to agree with the prophecy.

THE Dominion Government, early in 1912, gave the contract for the construction at St. John, N.B., of two miles of docks, a dry dock and ship repairing plant, costing $12,000,000, to the Norton Griffiths Co., Canada, Ltd.

The Docks.

The two miles of docks—twenty-three in all—are for the terminals of the Grand Trunk Pacific Railway Co. The dry dock, to be operated by its builders, will be one of the largest in the world, and there is also every possibility of a steel shipbuilding plant being established in the comparatively near future, the owners of one such having an agreement with the Norton Griffiths firm to come to St. John when the dock and harbor work is sufficiently advanced.

The C. P. R. already have terminal facilities at St. John, using seven docks, each capable of accommodating two vessels. These have, however, been found too small, and eleven more of like capacity are being built by the Government for the use of that railroad. In addition, the Intercolonial Railway have two docks, and there are two more at the Pettingill wharf, owned by the city.



Again, it is said that the C. N. R. is practically certain to make St. John its Atlantic terminus.

Three Transcontinentals.

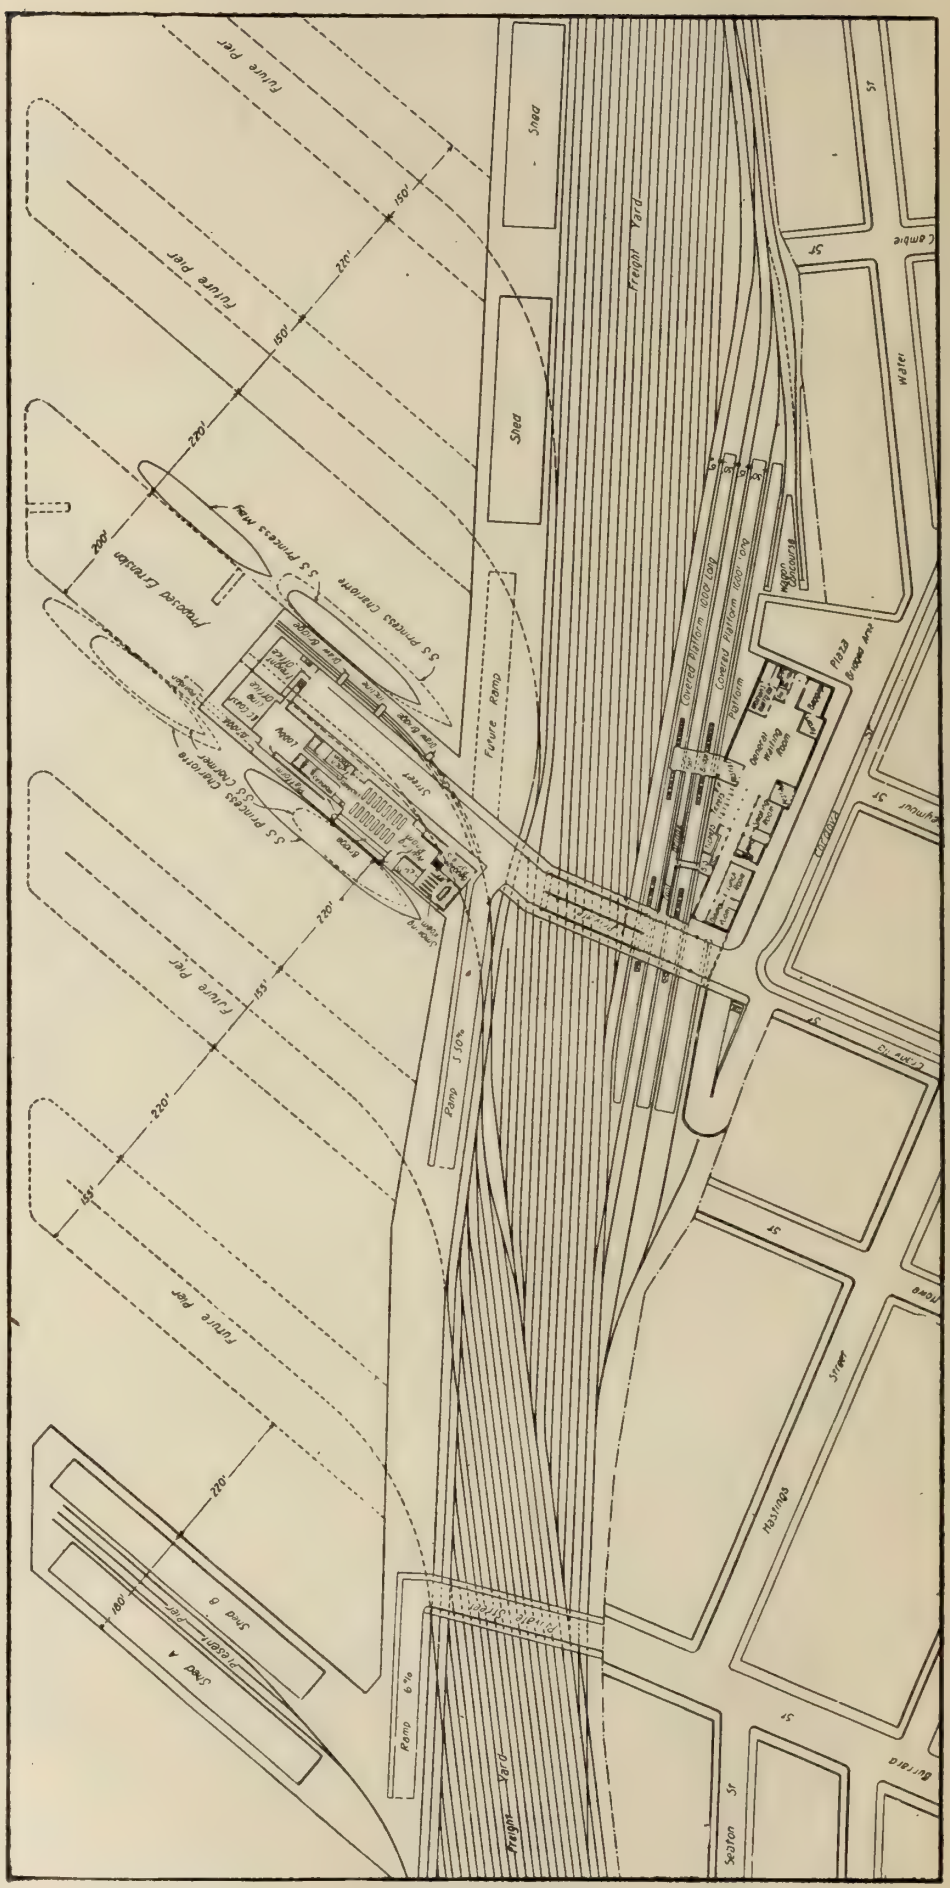
This will give St. John three transcontinental railways emptying the products of Western Canada and the United States on her wharves. Add to the railways, the Intercolonial, covering a rich territory as far west as Montreal; the St. John Valley Railway, which will tap, with its branches, the heart of the rich farming land of New Brunswick, and the upper reaches of the St. John River, navigable 100 miles inland, with its four branches, each navigable for over fifty miles, bringing the products of the farms right to the ship's side; then it will be at once seen that there are immense possibilities ahead for this progressive port.

Comparison of Distances.

A comparison of distance of time and transit between Liverpool and Chicago by the New York and St. John routes

ST. JOHN, N.B., AS A DISTRIBUTING CENTRE.

respectively, illustrates most emphatically the favorable position of the latter. The actual distance from Liverpool via St. John to Chicago is 24 miles less than the distance via New York, while in point of time consumed in transit of goods, the Canadian route has a much greater advantage. The shorter railway haul from New York to Chicago is joined to a longer ocean voyage from Liverpool, and therefore slower time is made on the New York route. Assuming steamers and trains on the two routes to be of the same relative speed, the St. John route is decidedly the faster of the two.



As to the Canadian trade, while St. John, as compared with Halifax, has two hundred and fifty miles longer ocean voyage from Liverpool, it has a shorter railway haul of 356 miles by the Canadian Pacific Railway to Montreal, and will be served by three competitive lines to that point, and four to the Pacific coast. By actual experience, merchandise shipped from Liverpool via St. John reaches Montreal, Toronto and other western points much more quickly than goods shipped at the same time via Portland.

During the session of 1908, the Dominion Parliament passed an Act providing that the British Preferential Duty be allowed, after the Act is called in force, only on goods entering Canada through a Canadian port. The present Government have said that they intend to carry out the intention of the former administration, and on the completion of the Grand Trunk Pacific, will issue an order-in-council putting the Act into force. This will mean that all the British goods now imported into Canada through Portland, Boston, Providence, New York and other United States ports, will then have to pass through St. John.

C.P.R. TERMINAL AT VANCOUVER.

THE development of the Canadian Pacific railway and steamship traffic from and into Vancouver has made necessary the extension of the existing facilities and accommodation at that port, for the efficient and rapid handling of freight, and the comfort and convenience of passengers en route.

The existing passenger station of the C.P.R. at Vancouver, located at the foot of Granville Street, near the shore line of Burrard Inlet, was built about fourteen years ago, and except for minor alterations is unchanged from its original plan. The general waiting room and ticket offices are at the street level, and the baggage room is on the track level, which is about 30 feet below the street. Along the water front, across

LAYOUT OF THE CANADIAN PACIFIC RAILWAY TERMINAL AT VANCOUVER, B.C.

the local freight yard tracks, are located the steamship wharves. There are two large sheds on a jetty pier of recent construction used by the Trans-Pacific steamship lines; also five sheds adjoining the longitudinal wharves used by the Seattle, Victoria, Alaska and other steamship lines of the Canadian Pacific Railway. Between the wharf sheds and the passenger tracks adjoining the passenger station, certain of the freight tracks serve the several sheds, and other tracks are used for drilling and storage. The yard tracks extend along the harbor front about 1½ miles.

Detail of Improvements.

The general scheme embraces a passenger station and office building suitably located on available land immediately east of the present passenger station. There will be four passenger tracks with provision for more when required, separated by wide platforms, between the station and the present freight yard. The passenger tracks are to be raised about 5 feet above the present track level in order to reduce the difference in level between the street and the tracks to about 25 feet. To avoid an inconvenient grade crossing and delays to traffic between the city and steamship wharf, a bridge, on the line of Granville Street extended, is to pass over the passenger and freight tracks to the steamship pier, and connect directly with passenger accommodations on the pier. An incline is also to be built leading from the west side of this bridge to the wharf, giving access to the lower deck of the pier and freight sheds and the water front. Another viaduct over the tracks is to be built on the line of Burrard Street extended northerly, with an incline giving access to the present Trans-Pacific pier and other portions of the water front.

Railroad Station.

The main entrance of the passenger station will be on Cordova Street, with the main waiting room located centrally in the station on the street level. Ticket offices serving the several classes of railway and steamship passengers are located at one end of the waiting room, and the baggage checking room, lunch and dining room, parcel room, women's waiting room, men's smoking room, news booth, information booth, and other facilities are all placed immediately adjoining the main waiting room.

On the lower floors of the station are located the baggage rooms, express companies' space, immigrant rooms, supply rooms, and other station facilities not directly used by passengers. Stairways and lifts connect the two levels of the station, and also afford communication with the office floors above. A separate footbridge is carried over the passenger tracks directly connected with the waiting room at one end and with stairways leading to the track level, giving access to platforms without crossing tracks at grade. The track platforms are 1,000 feet in length, and are to be covered with shelter sheds of the umbrella type. The platform adjoining the station will be used only for baggage, express and supplies.

Above the public rooms of the station building the space will be devoted to the general offices of the railway company. The interior arrangement of the office space will be adapted for a unit system of subdivision; that is, each panel will have heating and lighting facilities so that partitions may be placed or removed at will in order to provide for changes in arrangement of office accommodations which may be desired from time to time.

Steamship Station.

The proposed steamship station on the pier is a two-level building, the upper floor being devoted to the passenger business and offices, and the lower floor to freight, baggage and express. There will be double-level gangways on the west side of the pier, which will be used for the Victoria and Seattle service, the lower gangway being used for freight, and the upper for passengers; these gangways will be supported on floating pontoons to maintain the landing at a constant level with respect to the boats. On the passenger or upper level of the pier are provided waiting rooms, ticket offices, baggage checking room, customs office and other conveniences. Separate rooms are provided for outgoing and incoming passengers. Two tracks will be placed on the surface of the pier within the shed, and one track on the outside of the building for the direct handling of freight between cars and steamers.

The essence of the general design has been to secure easy lines of communication between the railway trains, steamers and the city. The traffic conditions at Vancouver are unusual as compared with other large terminals on account of the absence of suburban business. The aggregate number of trains is not large, but they are long and frequently are run in several sections and contain a number of classes of traffic.

The Westinghouse, Church, Kerr Co., Montreal, who prepared the plans, in conjunction with the C.P.R. officials, are also carrying out the constructional work.

If a separate and distinct trade school is found to be feasible and successful, it will require a practical teacher for the trade.

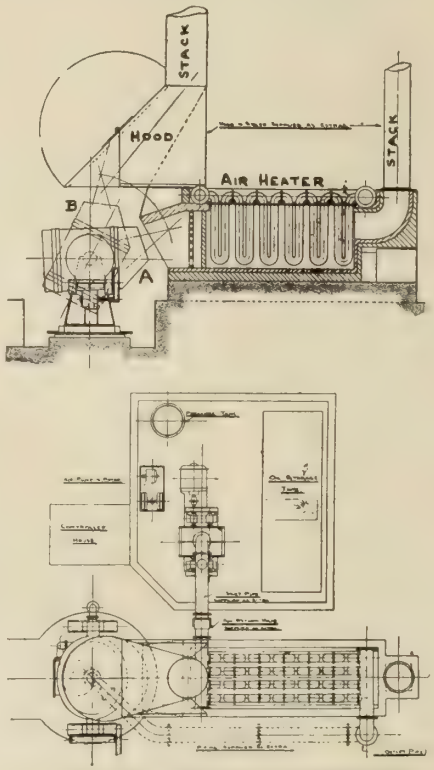
CANADA'S MERCHANT MARINE.

IN the calendar year 1911, there were built and registered in Canada 339 vessels, measuring 27,736 tons. During the year, 279 vessels were removed from the Dominion shipping register for various causes, and there were left on the books at the close of the year, 8,088 vessels of 770,446 tons. Of the total, 3,444 were steamers measuring 588,741 tons gross. The estimated value of all the vessels registered is $23,113,380. Roughly, 41,500 persons find employment in connection with the industry. Of the 142 registered steamships of 1,000 tons or over, a large proportion is engaged in the St. Lawrence and the Great Lakes traffic. The Emperor heads the list in size with 7,031 tons gross register; the E. B. Osler coming next, with 6,787 tons gross. There are quite a number of 4,000 tons gross or over.

Previously the standing of the Provinces, according to the net tonnage of both sailing and steam vessels, was:—Ontario, 236,877 tons; Quebec, 193,682 tons; Nova Scotia, 142,631 tons; British Columbia, 122,264 tons; New Brunswick, 55,872 tons; Prince Edward Island, 9,683 tons; Manitoba, 6,373 tons; Yukon, 2,708 tons, and Saskatchewan, 356 tons. The high standing of British Columbia is due partly to the fact that many of the ships of the Canadian Pacific fleet are registered there. Thus, Vancouver is fourth in the list of shipowning ports in Canada, with 45,573 tons to its credit, Victoria being second, with 65,350 tons; Toronto is third, with 57,513 tons, first place being held by Montreal with 145,274 tons.

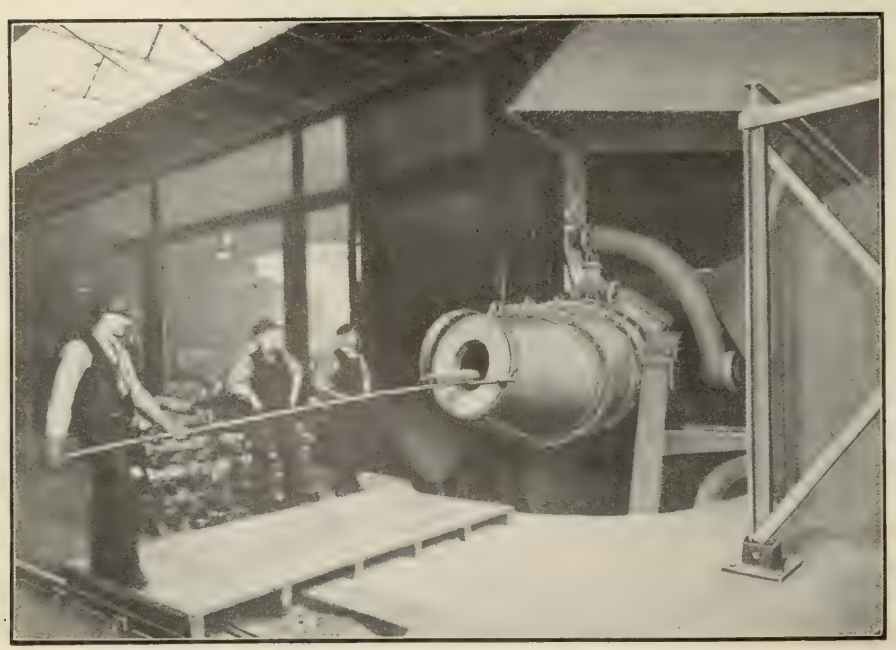
SHEET METAL MERGER.

A MERGER involving $1,500,000 has been effected by two of the largest sheet metal firms in Canada—the Metal Shingle and Siding Co., Ltd., Preston, Ont., and the A. B. Ormsby, Ltd., Toronto. The directors of the new concern are G. Dolph, Preston; A. B. Ormsby, Toronto; A. K. Campbell, Montreal; H. C. Randall, New York, and J. D. Murdoch, Simcoe. Factories of the company will be located in Toronto, Montreal, Winnipeg and Saskatoon. The plants in Winnipeg and Toronto will be known as the A. B. Ormsby, Ltd. The new company will manufacture important new lines of architectural sheet metal work and the plant for such work will be the largest of its kind in Toronto. Associated with the consolidated company will be the United Metal Products Co., of New York, the leading American manufacturers of interior fireproof lines. The head office of the company will be in Toronto.



Description of the Dominion's Latest Steel Foundry

Staff Article



The steel foundry just started up by the Dominion Steel Castings Co., Ltd., at Hamilton, Ont., is of particular interest from the fact that it makes steel by two distinct processes, one of which—the "Stock" converter process—is now being introduced into Canada for the first time. The establishment of this plant is another evidence of the growing demand for steel castings in every section of constructional and industrial engineering.

TO MEET the ever-increasing demand for steel castings, the Dominion Steel Castings Co., Ltd., was incorporated in July 1912, and forthwith commenced the erection at Hamilton, Ont., of an up-to-date plant, which is now practically completed. In fact, the first castings were turned out about six weeks ago, and the various buildings are now in a very much more advanced state than is indicated in our illustrations—the photographs from which the latter were made having been taken before the plant went into operation. Although the railways are still the largest purchasers of steel castings, there is a rapidly growing demand for smaller castings, notably from the automobile trade, and the Dominion Steel Castings Co. have laid themselves out to meet both requirements, being fully equipped for making large open hearth acid steel castings for locomotive and general machinery work, and also for turning out automobile and other light, intricate castings by the new "Stock" converter process. When in full operation the output of the foundry will be well over 1,000 tons per month,—a very appreciable addition to the total steel casting production of the country.

This is the first installation of a "Stock" converter in Canada and the second, we believe, on the American continent; so that a brief description of its leading features will be of interest.

A TYPICAL "STOCK" CONVERTER INSTALLATION.

CHARGING A "STOCK" OIL-FIRED CONVERTER.

The process was invented in England about four years ago and has there met with considerable success. The British Admiralty have investigated the process and have given it their approval; and as that body's specifications are perhaps the most stringent to be met with anywhere, this speaks volumes for the merits of the apparatus.

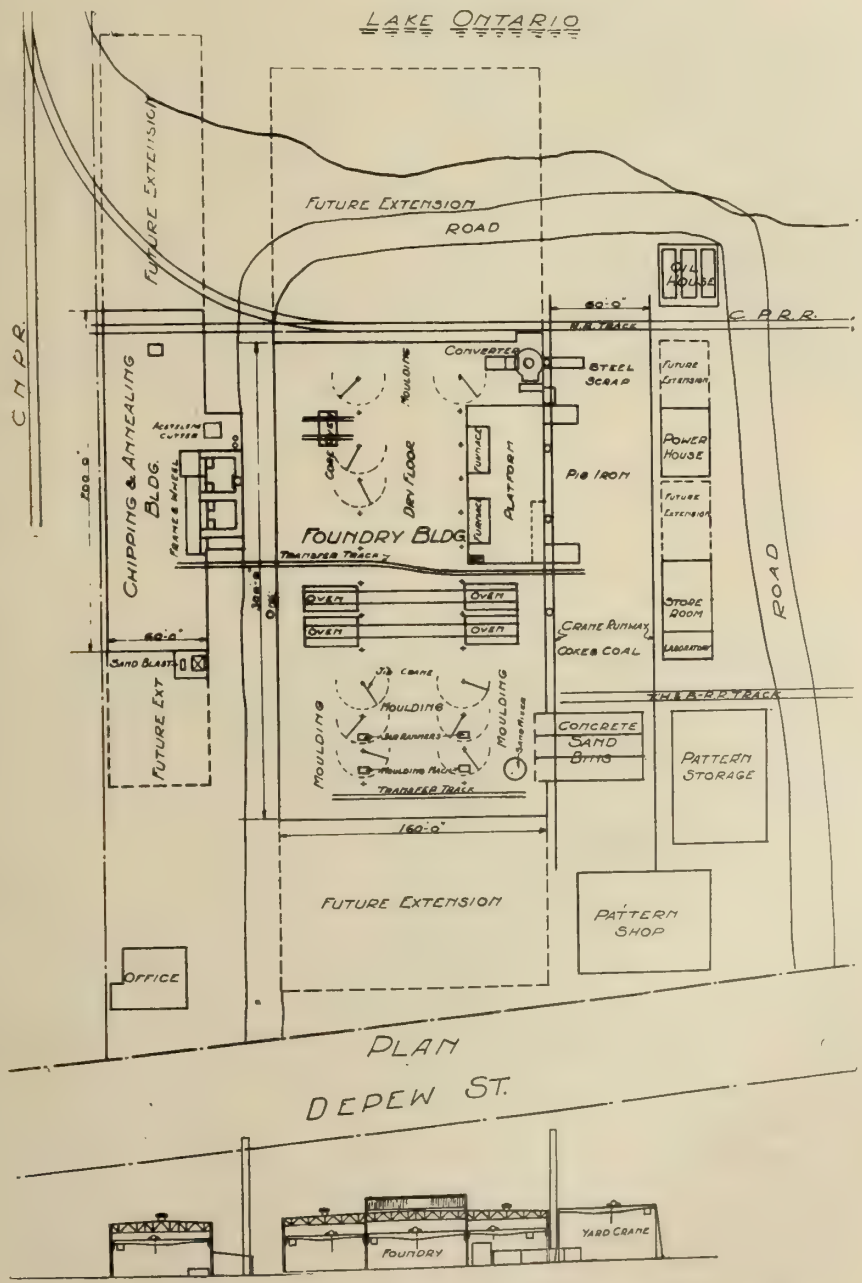
The process was first introduced to overcome the difficulty, generally experienced with the open hearth furnace, of economically making small castings in limited numbers. In the open hearth furnace steel can only be produced at a reasonable cost in comparatively large quantities; but the "Stock" converter will turn out castings economically in 2-ton, 1-ton or even smaller lots. An important feature in connection with it is that no separate cupola is required for first melting the charge. On the contrary the pig and scrap are charged cold directly into the converter and there melted by crude oil. The employment of this fuel has several advantages, not the least of which is the prevention of any possibility of impurities being introduced into the metal during melting.

A view of a "Stock" converter being charged is seen on this page, while the line cut above it, shows the general arrangement of a typical installation. The vessel is lined with ordinary silica firebrick and is oval in section, in order that a large surface of metal may be exposed to the action of the flame. Besides being fitted with trunnions supported in roller bearings, the converter is also mounted on a turntable and can be turned through a complete circle in a horizontal plane. When the converter has been charged, the turntable is swung round through an angle of 90 degrees into the melting postion, as seen at (A). From the line cut, it will be noted that the nose of the converter is pointing towards an economiser or air heater, which consists of a nest of cast iron pipes of special design, contained in a chamber lined with fire brick. Into these pipes cold air is delivered by the blower, and passes through the heater, the discharge from which is coupled to

the converter through a central pipe. The air leaves the heater at about 12 ozs. pressure, and at a temperature of some 800 degrees F. Very perfect combustion is thus obtained with a resulting economy of fuel. The hot gases of combustion are drawn through the air heater by the stack seen at the end of of the latter. With a 3-ton converter, the charge can be melted in about 1½ hours.

As soon as the metal is melted, the oil supply is cut off and the burners are removed from the blast box—this being a simple operation occupying a couple of minutes. The vessel is then tilted up, as shown at (B), and the conversion to steel continued in the usual way; the blast, which for melting was at about 12 oz. pressure, being increased to 3 lbs. or 4 lbs. Blowing continues for about 20 minutes, at the end of which period the converter is again brought to the charging position, and the necessary additions of ferro-silicon or ferro-manganese are made. The metal is afterwards poured into a ladle in the usual way. The special advantages of this system of making steel, not already mentioned above, may be classified as follows:—

1.—The amount of space occupied is comparatively small, due to the fact that the converter can be turned in a horizontal plane, enabling the arrangements for charging, blowing and pouring to be provided in the most convenient positions.



2.—The loss of iron resulting from cupola melting is saved.

3.—The high temperature of the melted charge allows the use of pig irons low in silicon, or the use of a higher percentage of scrap.

4.—The metal is in such a state of extreme fluidity that it is possible to make the most difficult and intricate castings. The last mentioned feature is well demonstrated by the illustration at foot of page 24, which shows a number of castings produced from steel made by this process. The goblets here seen are only 1-16 inch. in thickness and the radiator bracket in the foreground is only 3-16 inch. thick.

To give some idea of the scale of the illustration, it may be mentioned that this bracket is 32 inches long, the holes in it being 2 inches in diameter, and the outer flange ⅛ inch in thickness. The fine tracery in the ornamental placques in the background is also worthy of notice. All the castings shown were made from mild steel of 0.2 carbon. This illustration is merely introduced to show the possibilities of the process. The examples were not produced by the Dominion Steel Castings Company, who at present writing have not yet got their "Stock" converter completely installed. When it is in operation the company feel confident that no steel casting will be too intricate or difficult for them to make. They are also equally well prepared for turning out the heavier acid open hearth locomotive and general castings, the equipment for this work being of a high order as will presently appear.

Reverting for a moment to the "Stock" converter, it may be mentioned that such well-known firms in England as the Darlington Forge Co.; Sir Armstrong, Whitworth & Co.; the Wolsley Co.; the Daimler Motor Car Co.; and many other have installed these converters; in fact it is said that the Daimler Co. produce the whole of their automobile castings by this process.

LAYOUT AND CROSS-SECTION OF PLANT OF DOMINION STEEL CASTING CO.

Layout of the Plant.

The plant is situated on a site of 10 acres at the east end of the city about 2½ miles from the City Hall, and in the centre of the manufacturers' annex. A ground plan is shown herewith from which it will be seen that there are at present six buildings, viz.: power house, foundry, finishing department, store room and laboratory, pattern shop, and pattern storage building.

The stock yard, foundry and finishing department all run east and west parallel with one side of the property, and the successive stages of manufacture carry the product across the shops from south to north in a line at right angles to the main buildings. A railway siding runs across the east end of the site and thus serves both for the receipt of raw material and the shipment of finished castings.

Construction of Buildings.

The main buildings have steel frames, the columns being supported on concrete piers. Concrete side walls extend to a height of 6 ft., above which, there is a continuous steel sash reaching practically to the roofs. The latter are of 2½ inch reinforced concrete, supported on steel trusses and covered with "Neponset" roofing material.

The foundry has six monitors running across at right angles to the length of the building, resulting in excellent natural lighting over the whole shop. The whole of the steel work was manufactured and erected by the Hamilton Bridge Works Company.

MAIN BAY OF FOUNDRY WITH DRYING OVENS AND NO. 1 OPEN HEARTH FURNACE UNDER CONSTRUCTION.

The stock yard for storage of pig iron, steel scrap, coke, etc., runs parallel with the south wall of the foundry and is served by a 10-ton Northern crane fitted with a lifting magnet. The crane runway is 380 ft. long by 60 ft. span. At its west end are the sand bins. The sand-handling, storage and grinding facilities have been carefully designed with a view to the maximum of efficiency and economy The sand is received on the track at the east end of the plant and is unloaded from the cars into buckets. These are carried by the stock yard traveler to the sand storage bins and there dumped through openings in the roof. The sand storage building is of concrete, 65x40 ft., and runs at right angles to the foundry, near its west end.

The Foundry.

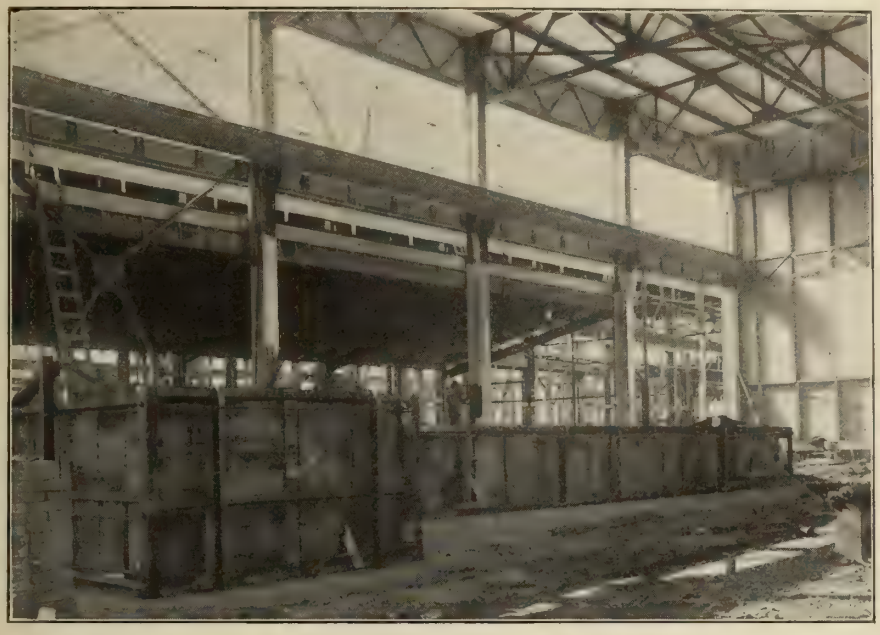
The foundry is 300 ft. long by 160 ft. wide, the two end walls being merely of a temporary nature to allow of future extensions. The building is divided into three bays, there being two side bays of 50 ft., and a centre 60 ft. bay. Each of the side bays is served by a 10-ton Cleveland crane and the main bay by a 25-ton crane of the same make. The 60 ft. bay will be further equipped in the near future with a second crane. This will be of 30 tons capacity with an auxiliary 5-ton hoist.

The south 50-ft. bay is occupied by the sand grinding pans, the drying ovens, two open-hearth furnaces and the "Stock" converter. The 60 ft. bay forms the heavy work floor and main casting floor, the bench molders and core departments being in the north 50 ft. bay.

The sand mills are located in the south-west corner of the foundry adjacent to the sand bins in order to reduce handling to a minimum. They are of the old-fashioned roll type generally used in steel foundries and are motor-driven. They were supplied by Phillipps and Maclaren, Pittsburg.

Melting Equipment.

The melting equipment consists of two 20-ton acid open-hearth furnaces and a 2-ton "Stock" converter as previously mentioned. The open-hearth furnaces were designed and built by Wm. Swindell and Brothers, Pittsburg. They are equipped for burning fuel oil and are set up about 8 ft. above the foundry floor, thus rendering the checker work easily accessible and enabling tapping to be done without the use of a pit for the ladle. The melting platform is of structural steel and extends the full width of the 50 ft. bay. It is of substantial construction as the company intend to instal a charging machine of the overhead type at an early date. The platform extends out about 20 ft. into the stock yard, and is provided with a narrow gauge track on which charging trucks run. The latter are run out to the end of the extension and there loaded up by the stock yard traveler.



Drying and Core Ovens.

The company intend to go in principally for dry sand work, the foundry being equipped with four drying ovens, 15 ft. long by 40 ft. inside, fired by coke from a pit running along one side. The flues have been specially placed to give a very uniform distribution of heat. The ovens are served by the interesting type of truck shown on page 24. The

ANNEALING FURNACE FIRING PIT.

tracks consist of two sets of rails carrying a number of 8-inch cast iron balls. The truck has bolted to its under side four similar rails, the whole forming a "cage" for the "ball-bearing." The balls are not attached to the truck in any way, but are distributed at intervals along the whole length of the track, both inside and outside the ovens. When a mold has been placed on a truck, the latter is merely rolled forward on the balls and thus enters the oven.

ANNEALING ROOM, SHOWING FURNACES IN COURSE OF ERECTION.

The core ovens are located in the middle of the core room, and are served by trucks from either side in such a manner as to make their operation continuous. They are fired by coke and are conveniently situated to serve both the main floor and the bench molders.

The foundry is piped for compressed air and will eventually be fully equipped with jar ramming and other molding machines, as the work may require.

The Annealing and Finishing Department.

These are in a separate building measuring 60 ft. by 200 ft. It runs parallel to the foundry with which it connected by a narrow gauge transfer track and a standard gauge shipping track. The building has a height to the roof truss chords of 28 ft., and is served throughout its length by a 10-ton Northern crane. There are three annealing furnaces, all castings made by the company being carefully annealed. While most steel foundries are now giving this matter careful attention, the ovens used are often mere plain brick chambers in which but little attention has been given to the circulation of the heat, with the result that a uniform annealing of the castings is impossible.

At the plant under consideration, however, the annealing furnaces are of the most modern description, and have been carefully designed to give an even distribution of heat. There is a special furnace for annealing locomotive frames and similar large castings. This is 40 ft. long by 5 ft. deep by 6 ft. wide, and is fired by four fire holes along one side. Heat from the fires passes over the castings and enters downtakes in the floor, passing thence through flues underneath the furnace bottom to a steel stack. In this way the heat is made to pass completely around the castings. The furnace is of course of the open top type. The covers are sectional, lined with fire brick, and are removed by the overhead traveling crane.

The furnace for annealing locomotive driving wheel centres and similar castings is also of the open top type and measures 7 ft. by 7 ft. In addition to these, there is a 4 ft. by 6 ft. furnace for smaller castings. All three are fired by coal.

The equipment so far instaled in the finishing department for removing gates, risers, etc., consists of a heavy shaper and three cold saws; these are all motor-driven. In addition, there are two 20-inch double floor grinders and three swing frame grinders, all by the Ford-Smith Machine Co., Hamilton. These are driven from a line shaft along the north side of the shop. The swing frame grinders are fitted with bearings at their upper end and swing on the revolving line shaft.

For straightening castings, the company have designed a special press consisting of a bed plate 20 ft. long with a movable housing or frame. The latter is equipped with a hydraulic ram having a travel the full length of the bed plate, which enables pressure to be applied to any part of the casting.

Further equipment in the finishing department includes an oxy-acetylene outfit for cutting off large gates and risers, and a sand blast apparatus, the latter being housed outside the main building.

The Power House.

Power is purchased from the Cataract Power Company at 2,200 volts pressure. This is reduced by two 100 kw. transformers in the power house to 220 volts for the arc lighting and the motors driving the sand mills, pattern shop, etc. For operating the cranes and stock yard magnet, there is a 150 h.p. motor generator set delivering direct current at 220 volts. The motor is direct-coupled to

CHARGING PLATFORM, NO. 1 OPEN HEARTH FURNACE IN THE BACKGROUND IS SEEN ONE OF THE DRYING OVENS UNDER CONSTRUCTION.

the generator and is of the induction type, taking current at 2,200 volts.

Compressed air is supplied by an Ingersoll-Rand two stage compressor having a capacity of 700 cubic feet of free air per minute. This is operated by a short belt drive from a Westinghouse 2,200-volt induction motor. For providing blast to the "Stock" converter there is a Root's blower driven by a Westinghouse 100 H.P. variable speed 220-volt motor.

Further equipment in the power house includes the oil distributing pump and pressure tank. Crude oil is stored in three underground steel tanks of 12,000 gallons capacity each. These are located near the track at east end of the plant and are filled by gravity from tank cars. From these tanks, the oil is drawn by a small vertical triplex pump in the power house which delivers the oil to a pressure tank. Compressed air is piped to this tank, the oil being thus distributed to the open hearth furnaces and the converter. The pressure tank is fitted with a coil through which steam is passed to reduce the viscosity of the oil. A small boiler in the store house supplies the steam for this purpose and also serves as a standby for atomising the oil should the electric power fail and thus render the air compressor idle.

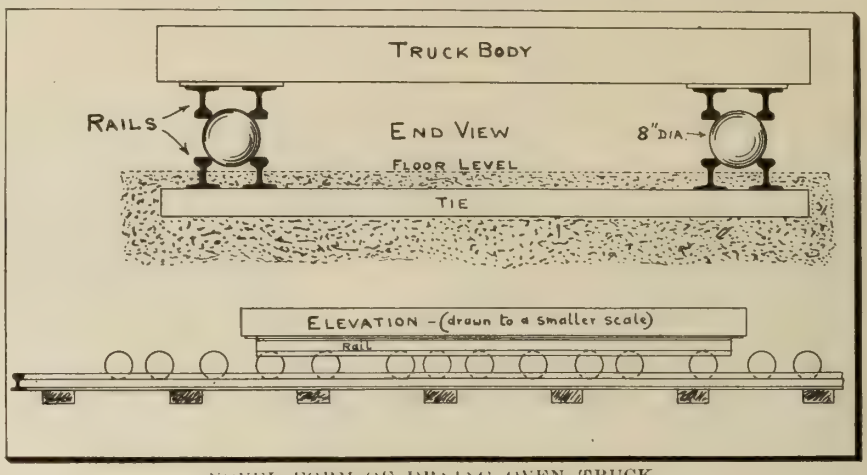
Precautions have also been taken to prevent a failure of the oil supply to the furnaces. The triplex pump, mentioned above, is driven from a short line shaft belted to a 2-h.p. motor. Both pump and motor stand side by side upon the power house floor, the shafting being overhead. There is now being installed a small steam turbine alongside the electric motor. Both have the same size of pulley and run at approximately the same speed. Should current fail, the belt will simply be transferred from the motor to the turbine, the pulley on the countershaft above being much wider than the belt in order to allow of this. The Waterous Engine Works Co., Ltd., Brantford, Ont., are the makers of the triplex pump.

Pattern Shop.

The pattern shop is located at the west end of the site, and measures 60 ft. by 80 ft. It has concrete walls for a height of 6 ft., and continuous steel sash above this. This sash extends round all four sides of the building, which is further provided with a saw tooth roof having a northern aspect. The result is a shop that for good natural lighting would be hard to beat. It is well laid out for the making of large or small patterns and is well supplied with the usual wood-working machinery mostly supplied by the Berlin Machine Works and the Canada Machinery Corporation.

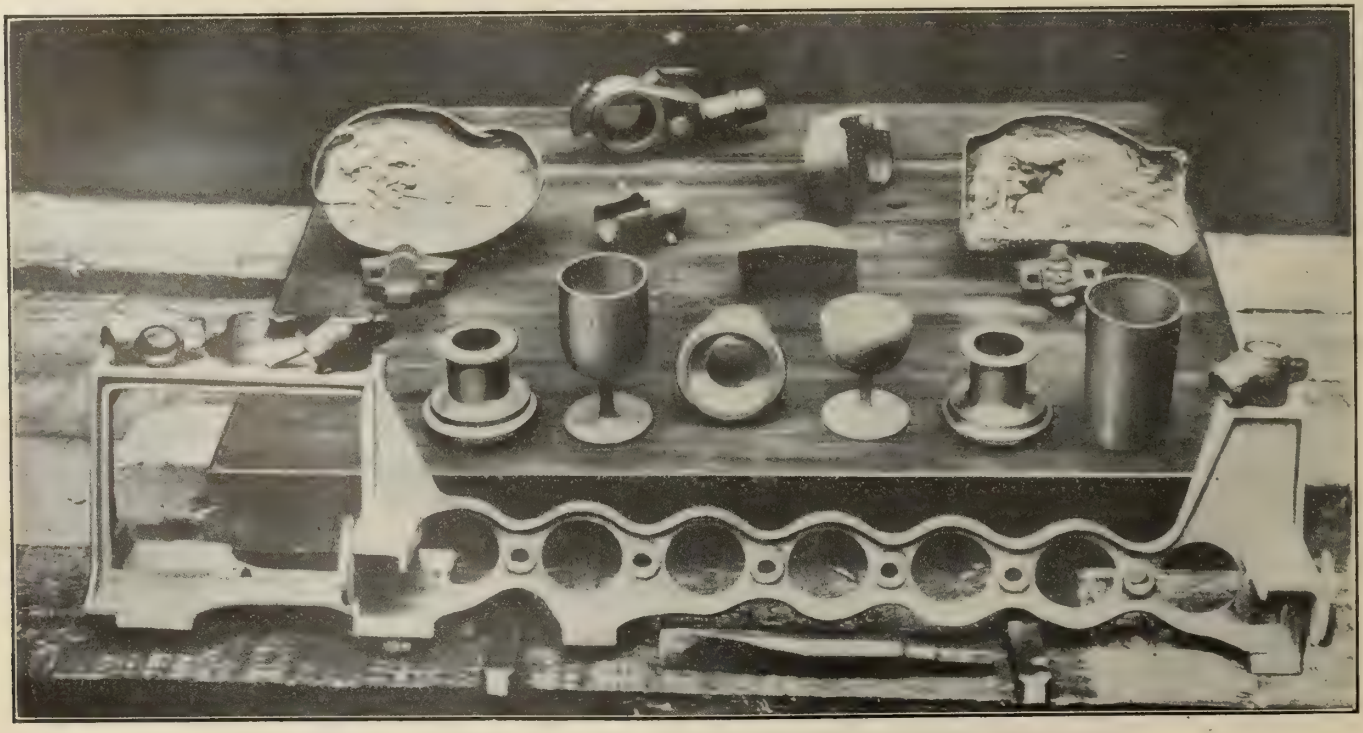
General.

An up-to-date laboratory has just been completed and is fully equipped for making complete chemical and physical tests of the steels produced.



The capital of the company is $500,000 and the executive officers are:—

C. W. Sherman, President and General Manager.



Allan Mosher, Vice-President.

Austin C. Taylor, Secretary-Treasurer.

In a few weeks from now, the plant will be in full operation and producing open hearth and converter castings at the rate of over 12,000 tons per annum.

NOVEL FORM OF DRYING OVEN TRUCK.

SPECIMENS OF CASTINGS PRODUCED BY THE "STOCK" OIL-FIRED CONVERTER.

Dodge Manufacturing Company's Plant, Toronto, Ont.

Staff Article

In these days of specialization and standardized products, it is difficult to realize that only 35 years ago there was not a single dealer in pulleys doing business, owing to the fact that it was utterly impracticable to carry the enormous stocks that would at that time have been necessary in order to fill an order for a pulley of any diameter and width to suit any size of shaft. The coming of the modern pulley, with interchangeable bushings, completely revolutionized the business and it is now possible to meet any demand from a comparatively small stock.

IT IS no exaggeration to say that the name "Dodge" is known wherever transmission machinery is used, not only in Canada, but also in Great Britain, Australia, New Zealand and every other part of the British Empire. The Dodge Manufacturing Company started business in Toronto in April, 1886, at which date they commenced the manufacture in Canada of the well-known Dodge patent wood split pulley, which rapidly became a general favorite.

As time went on, the business was gradually extended to other branches of the power transmission business, until now the Dodge Mfg. Co. is by far the largest concern of its kind in Canada. The following partial list of lines manufactured will give some idea of the wide field covered:—Shafting, hangers, pillow blocks, couplings, collars, wood split pulleys, solid and split cast iron pulleys, friction clutches, spiral conveyors, chains and sprockets, rope and wire cable drives, coal, grain, stone and ore handling machinery, factory and shop trucks, turntables, tracks, overhead shop track conveyors, jib cranes, incline elevators, etc., etc.

The plant is situated at the western end of the city and occupies a site of approximately eight acres. As may be seen from the plan on page 18, the various buildings are compactly arranged and there is ample space for further extension when required. Spur tracks from the Canadian Pacific Railway are conveniently laid out to serve the yard and the raw and finished material sheds.

Pelham Avenue divides the site into two parts, the metal working shops being to the north, while the wood pulley factory and power house are to the south of this street.

Making Split Wood Pulleys.

The wood pulley shop is a 3-storey brick building, measuring 248 ft. by 52 ft. On the ground floor the material for the finished pulley is gotten out, the stock for arms, hubs and bushing going through the various stages on one side of the shop, while a continuous stream of segments for rims is turned out on the other side. This material then ascends by elevators to the second floor, a view of which is shown on page 19. Here various processes, such as glueing and nailing up rims, anchoring arms into rims, boring, turning and balancing, take place. The top floor forms the paint shop and stock room.

It will perhaps be interesting to follow the various operations in a little more detail, and trace the course of the lumber from the lumber pile to the stock room. A stock of over 1,000,000 feet of lumber is kept on hand, hard maple being used for the pulley arms and soft maple for the rims—only the best quality being used in both cases. From the stock yard the lumber is, of course, taken first to the dry kilns, three in number. These are situated behind the power house and are heated on the Sturtevant system, with air heated by exhaust steam. They are also fitted with coils for heating by live steam if necessary. The trucks emerge from the kilns by doors opposite those by which they entered and are then carried by a transfer track to the planing mill, which lies parallel to the kilns, the power house intervening. Rim stock (soft maple) and arm stock (hard maple) are kept separate, and in describing the various processes it will be more convenient to consider each separately.

Rim stock on entering the planing mill is first rough sized to thickness on a planer which is in line with the track by which the stock is brought from the kilns. It is next taken to a cross cut swing saw and cut roughly to lengths suitable for segments to form the rim of the particular size of pulley being made; the number of segments, of course, varies with the diameter of the pulley. Before passing to the band saws the stock is tongued and grooved in a matcher. Besides cutting the tongue and groove, this machine also glues the joint. Several lengths of stock are next jointed together and placed in a clamp.

In this way the waste of lumber when cutting out the segments is reduced to a minimum. Fig. 3 clearly shows this;

FIG. 1. BIRD'S EYE VIEW OF DODGE MFG. CO. PLANT.

it will be seen that six segments are cut from four pieces of stock, though each individual board is only large enough for one segment if sawn separately. The cutting out of the segments is done on a band saw, the table of which is fitted with a simple radial attachment. From the time the lumber leaves the planer at the entrance to the shop it is carried along from one machine to another on special trucks, one of which is seen in Fig. 5.

From the band saw the segments go to a planer and are there planed to a uniform thickness of 1⅛ inch. They then pass to a circular saw, the table of which is fitted with a series of stops, by means of which each segment is cut off to an exact fractional part of a circle. The next step is to cut the dovetails seen in Fig. 8 at each end of every segment, this being done on a special dovetail saw.

The segments now go up to the second floor. They are here laid out in a circle and wooden keys are driven into the dovetails, at the end of which operation each course appears as in Fig. 8. These rings, or courses, are then taken to the glue room, which occupies one end of the floor and is equipped with a large coil box, powerful screw clamps, etc. A number of courses are here glued together to form the required width of pulley. In the case of a pulley requiring eight courses, four are left cold. The hot courses are glued on both sides and a cold and a hot ring placed on top of each other alternately. In this way the glue is kept thoroughly fluid for some time after the pulley has been placed in the press.

These presses have screws 2½ inches in diameter, the thrust being taken by a maple beam 12 inches square. This will give some idea of the great force with which the courses are pressed together. Each ring is pressed into absolutely perfect contact with its neighbor, so that an extremely strong joint is formed. In fact, we believe that experiments have proved that the joint is actually stronger than the solid wood.

After remaining in the glue press until thoroughly set, the pulley rims are taken to the chuck lathe to be "gutted," ie., turned out inside to the required diameter. They are then ready to be split horizontally and dovetailed for the arms. The splitting is done on a band saw, but the cut is not a straight line. For when the saw has entered a short distance the operator gives the work a slight twist and afterwards allows the saw to run out straight; so that the cut is somewhat in the shape of a very flat ogee.

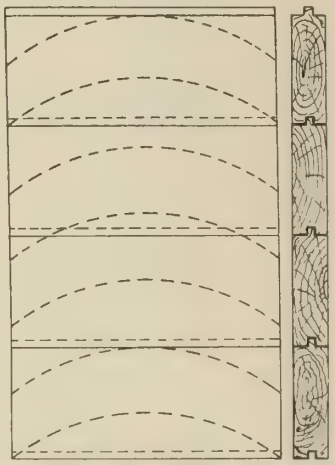


FIG. 3. SHOWING METHOD OF ECONOMIZING LUMBER WHEN SAWING SEGMENTS FOR WOOD PULLEY RIMS.

This prevents any possibility of the two halves of the pulley being assembled the wrong way round on the shaft.

The rim is now marked from a template and has the notches for the arms cut out on a band saw. This method of attaching the arms is an exclusive Dodge feature and is clearly seen at (D), Fig 7. A wedge (B) secures the dovetail joint and the arms are further held in place by anchor bolts (C), which prevent all motion at the dovetailed joint (D). These bolts are secured in the rim by concealed malleable nuts (E). It will be seen that rim is not pierced at any point; consequently the entire rim face is left smooth and intact, presenting a continuous belt surface with no projecting ends of arms to act as belt destroyers.

How the Arms are Made.

Returning now to the ground floor we may rapidly follow the course of the hard maple (arm stock). The machines operating on this stock are all arranged along the south side of the planing mill, while those dealing with rim stock are on the north side.

The arm stock on coming from the dry kiln is cut to rough length by a swing saw and is next rip-sawed to width. The stock is then taken in convenient trucks to a jointer, and jointed on one edge and face, afterwards being planed to a uniform thickness. A bevel saw next cuts it to length and the arms are then ready to have the hub blocks inserted. For this purpose they pass to a gainer and are gained out at the centre. The hub blocks are then driven in and the arms are returned to the gainer and cleaned off flush on the edges, for which purpose the machine is fitted with a special head.

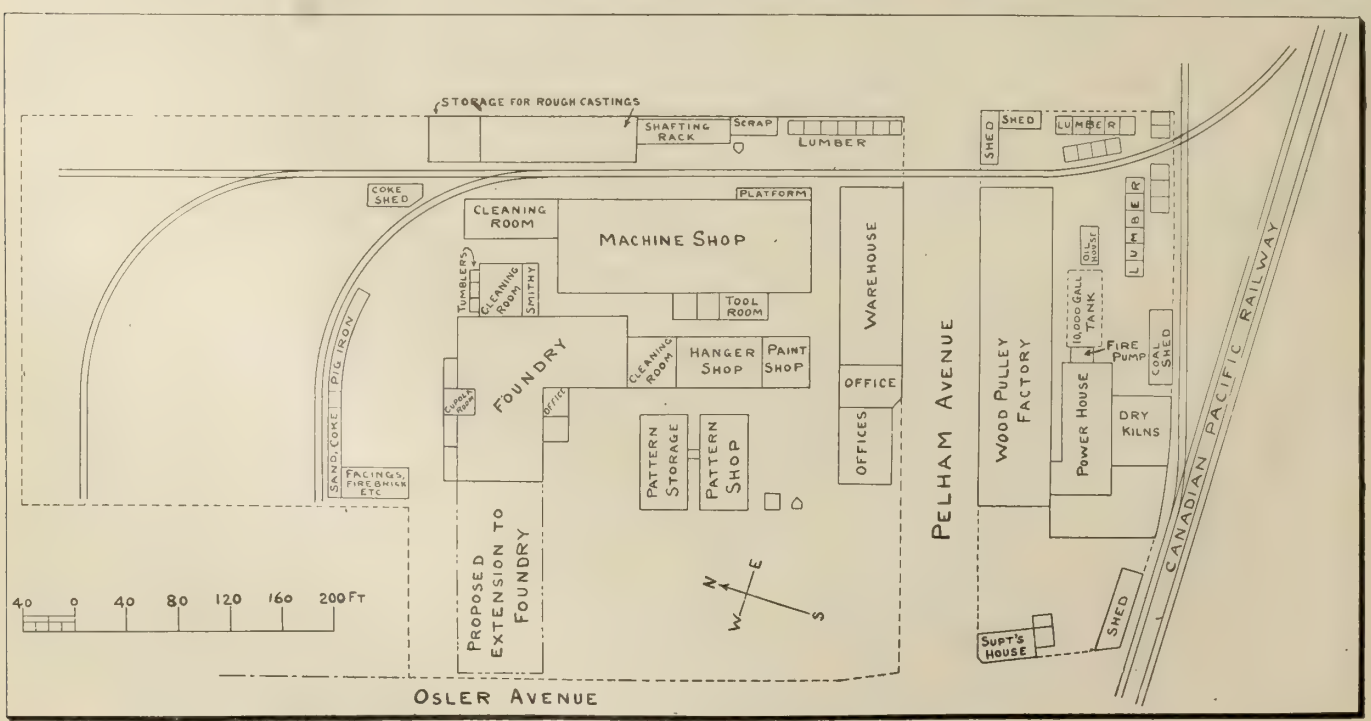

FIG. 2. PLAN OF DODGE MANUFACTURING CO. WORKS.

The arm stock now passes up to the second floor, where it is dovetailed for the rim fit by a special horizontal circular saw. The bolt holes for the compression-and anchor-bolts are next drilled, after which the arms are ready to be fitted to the rim.

The two halves of the pulley are now bolted together, with slips of wood inserted at the joint of the hub; and the hole for the shaft or bushing is bored out in a chuck lathe. The insertion of the wood slips prior to boring is for the purpose of making provision for compression when the pulley is mounted on the shaft. All standard pulleys have either 1 11-16 inch, 2 7-16 inch, 3 inch or 3½ inch—the outside diameter of the bushings being made to correspond. From the chuck lathe the pulley goes to the nailing machine seen in Fig. 6, where the segments are very thoroughly nailed. This machine is by the Morgan Machine Co., Rochester, N.Y., and will easily drive 8-inch nails.

Up to this stage the pulley has not yet attained its full width of face. So from the nailing machine it goes back to the glue room and has two outside courses glued on. These assist in preventing any side movement of the arms and give a nice finish. The next step is the turning of the pulley on the sides and face of rim. This is done in special lathes, which automatically size the pulley, both as to diameter and width. After being turned the pulleys are accurately balanced on a special balancing machine of the company's own design. They then pass again to the nailing machine to have the outside courses nailed. This does not disturb the balance in the least as only two nails are driven into each segment, and care is taken to locate them symmetrically around the rim.

The final operation is now performed, viz.:—painting and varnishing. The top floor of the factory is divided into two parts, the west end being occupied by the paint shop, while the rest of the flat forms the wood pulley stock room. On coming into the paint room the pulleys are first given a coat of boiled oil all over. The periphery is then filled with a special silax filler, which "case-hardens" the face of the pulley. The arms, hubs and inside of rims are covered with a special mixture of blue-black lead and oil pulley paint. In addition to this the entire pulley receives a liberal coating of waterproof varnish.

The Stock Room.

When dry they are removed to the stock room, alongside the paint shop. Here the smaller pulleys have their rims wrapped in stout paper, while larger sizes are wrapped with wood veneer. The Dodge Co. carry in stock all sizes of split wood pulleys from 4 inches diameter by 12 inches face up to 48 inches diameter by 12 inches face, with all intermediate diameters and widths. The stock on hand at any one time averages 20,000 pulleys, in addition to those carried at the firm's city office in Toronto and at their large warehouse in Montreal. The average output is 300 pulleys per day, but this quantity is capable of being increased at any time.

In addition to pulleys the stock room carries enormous quantities of hard wood bushings. This system of interchangeable bushings, originated by the Dodge Co., was the means of completely revolutionizing the pulley trade; since their use enables any pulley to be fitted to any size of shaft, within certain limits. The bushings are all of best selected hard maple and are turned from square stock in the planing mill. After being sawn to length, the stock is turned on a lathe fitted with a sizing stop. The turned bushing is next split on a machine designed and built by the Dodge Company. It consists of two small cir-

FIG. 6. WOOD PULLEYS BEING NAILED ON NAILING MACHINE.

FIG. 4. VIEW ON MIDDLE FLOOR OF WOOD PULLEY FACTORY.

cular saws running horizontally. The table is pushed by hand between the saws and the bushing is thus accurately and rapidly cut in halves.

The ground and second floors are equipped with an efficient exhaust blower system with suction pipes leading to hoods covering the cutters of every machine where possible. Floor sweep openings are provided for machines such as chuck lathes, which cannot be equipped with hoods. In this way all shavings, dust, etc., are carried off to the power house and burned under the boilers. The wood pulley factory is heated by indirect radiation, and artificial lighting is provided by incandescent drop lights. The various machines are operated from line shafting driven by motors, the current being partly generated in the works power plant and partly purchased from outside sources, as will be explained later.

From the above description it will be seen that the Dodge split wood pulleys are constructed by the most modern methods and are of the best material. All pulleys over 36 inches diameter are made with two stub arms at right angles to the main arms. These are secured in the hub and rim by a tenon and mortise, but, as in the case of the main arms, do not pierce the rim. Thus the continuous belt surface of the periphery is not broken. The arms, as may be seen in Fig. 7, are cut away along their middle line as much as is consistent with an ample factor of safety, in order to reduce windage to a minimum. The Dodge Company have made thousands of special wood pulleys in addition to their standard lines. The smallest ever made by them was 2 inches in diameter and the largest

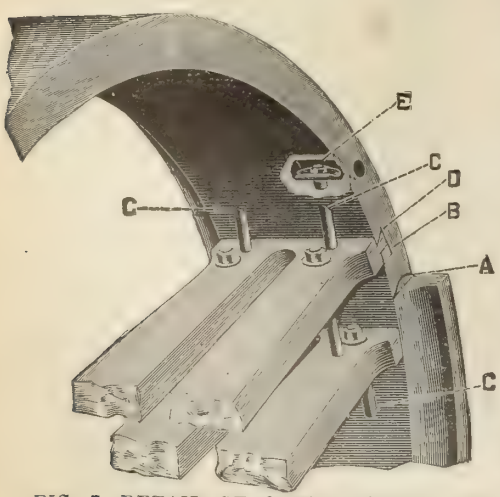

FIG. 7. DETAIL OF CONSTRUCTION OF "DODGE" WOOD PULLEY.

20 feet. To turn the latter a gap had to be cut in the shop floor and a special rigging fixed up.

About 100 men are employed in the wood pulley department, which is approximately 33 per cent. of the total pay roll.

The Main Works.

The offices, warehouse and main shops are situated on the north side of Pelham Avenue and, as may be seen from the plan on page 26, are very compactly arranged. The lay-out shows careful thought and is designed to allow of continuous movement of castings in a direct line from foundry to ware-

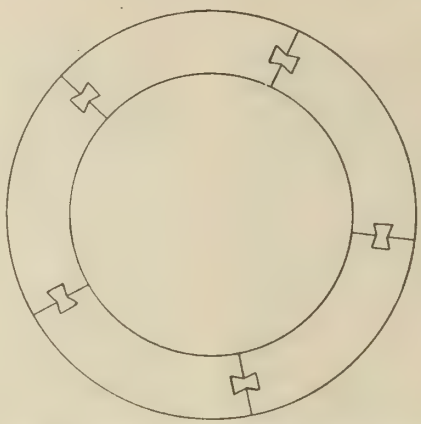

FIG. 8. JOINTING OF WOOD PULLEY SEGMENTS.

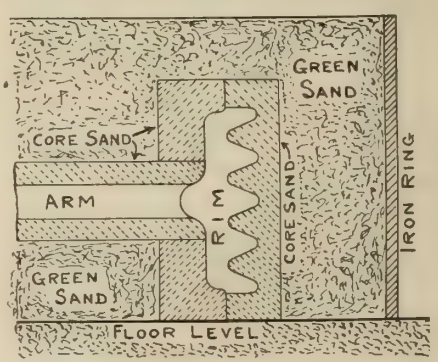
house. The latter, it will be noticed, is situated at the south end of the site and the foundry at about the centre. North of the foundry storage bins is a spacious yard which allows ample space for future extensions. It is at present used for lumber storage, etc.

The Pattern Shop.

Taking the various shops in their logical sequence, we first come to the pattern shop, the location of which is seen on the plan on page 26. This is a brick building of two storeys and an attic, and measures 75 ft. by 32 ft. The ground floor is chiefly used as a foundry carpenters' shop, and for roughing out material for the patternmakers upstairs. It also accommodates the heavier machinery, such as rip saws, cut-off saws, planers, jointers, etc. Here also are located the lavatories and toilet rooms for the patternmakers.



The second floor is the pattern shop proper, and forms an exceptionally well lighted, airy shop. Exhaust blowers, situated on the ground floor, carry off all shavings and dust from every machine and convey same to a shavings vault outside the shop. There is accommodation for twelve patternmakers, each of whom has a bench at a window, equipped with an Emmert universal vise. The foreman has a well lighted office in one corner, from which he has a clear view of the whole shop. There is a full equipment of band saws, turning lathes, sanders, etc., including a patternmakers' double disc sander designed and built by the Dodge Company. This is equipped with a tilting table and has proved a great labor saver.

The method of making fillets in this shop is an interesting one. Instead of using leather the Dodge Company make their fillets from a special mixture, of which the chief ingredient is beeswax. The mixture is heated and forced through a small cylinder under great pressure. As it emerges it is wound off upon reels. This fillet wax is made in two sizes, ⅛-inch and 3-16-inch in diameter. To use it the pattern is given a touch of shellac to make the fillet stick; a length of wax is then rolled off the reel, dipped into hot water to soften it, and pressed into place by a brass slicking tool rounded to the correct radius. In this way a cheap and durable fillet is formed, the wax rapidly becoming as hard as dry putty.

The attic of the pattern shop is used for storage of those patterns that are so frequently used that it is convenient to have them near at hand. But the greater bulk of the patterns are kept in a special store, which is a building of exactly the same size and style as the pattern shop and is connected thereto by a bridge with intervening fire doors.

Pattern Storage System.

The total number of patterns probably amounts to between 35,000 and 40,-

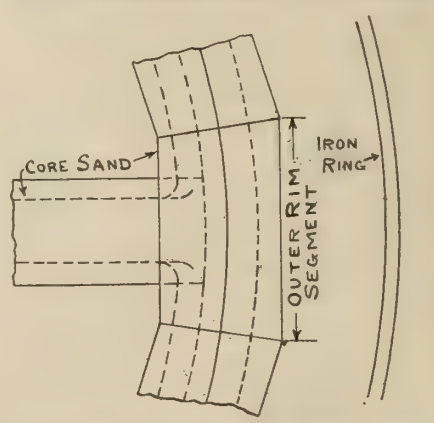


FIG. 9. METHOD OF MOULDING LARGE PULLEYS.

000; and yet any one can be quickly found when wanted. The pattern store, of course, has the usual shelves and is divided up into streets and aisles, each bearing a distinctive letter. Each aisle is divided into two sections, numbered 1 and 2.

The patterns are classified into groups such as hangers, take-ups, belt-tighteners, pillow blocks, etc. Each group is given a symbol letter taken from near the beginning of the alphabet, and subgroups have an additional letter from nearer the end. For instance, all shelves for rope drives are in group A, and letters such as O, P, R, indicate the particular size of rope for which sheave is intended. Each individual diameter and width of face is, of course, given a separate number. Thus A.O.600 will indicate, let us say, a sheave for 1-inch rope, 40 inches in diameter and having 12 grooves.

When an order is received calling for a new pattern the engineering department allot the latter a number in its proper group, at the same time making out a card for their card index. A duplicate of this card index is kept by the foreman patternmaker, who, on completion of the new pattern, enters on his card the number of the floor, aisle, section and shelf where the pattern is to be found in the pattern store. This record is also added on the engineering department's card as a precaution against the accidental destruction or loss of the foreman's card.

The ground floor of the pattern store carries the heavy wood patterns and the metal patterns used on the moulding machines, the lighter patterns being stored on the second floor. The attic is given over to patterns that are seldom used.

The Foundry.

The foundry building is in the shape of an inverted letter L, the long leg being used for heavy work, and the short leg for machine moulding and light work generally, such as hangers. The heavy foundry lies approximately east and west and measures 124 ft. by 66 ft. It is intended in the near future to extend this building westward to the boundary of the company's property on Osler Avenue.

The heavy foundry is divided into two side bays of 16 ft. each and a centre bay of 30 ft. The latter is served by a 10-ton, 3-motor, overhead traveler built by the Morgan Engineering Co., Alliance, Ohio. The centre bay is of considerable height, the crane rails being about 28 ft. above floor level. This enables large pulleys, flywheels, etc., to be conveniently handled.

The north 16-ft. bay is occupied by the core ovens, cupola room and the bench moulders. The core ovens, three in number, are in the north-west corner, the core makers being immediately opposite in the south bay. The cupola room measures 20 ft. by 17 ft. and contains two Colliau cupolas. The larger is a 64-in. with 9-in. lining, and the smaller a 44-in. lined up to 34 in. The latter cupola is seldom used. Blast at 12-oz. pressure is delivered by a Buffalo Forge Co.'s 48-in. "Noiseless" blower, belt driven by a 35-h.p. induction motor. Pig, coke and limestone are brought by an electrically operated elevator to the charging platform and there weighed on platform scales. The cinder mill is conveniently situated near the cupolas on the ground floor. Sand, coke, etc., are discharged from the railroad cars direct into storage bins alongside the track, thus reducing handling to a minimum. These bins are shown on the plan, a short distance to the north of the foundry.

The Dodge Co.'s method of moulding large rope sheaves, large belt pulleys, etc., is of considerable interest. Instead of sweeping up the rim in loam or green sand and making the hub and arms in dry sand, as is the common practice, they always mould the outside face of the rim in dry sand and frequently the inside face also. Fig. 9 shows how this is accomplished in the case of a rope pulley, the rim and part of one arm only being shown. The rim is moulded in dry sand segments, each segment being made in a core box. Very large or wide pulleys are moulded in a pit, but those of moderate size merely have the floor levelled off and a flat core plate, to build up the hub cores upon, bedded into the floor. A circle is then marked out on the floor and the rim core segments are set to this. In the case of a six-armed wheel, six of the inner core segments are provided with an inlet for the arm core. The latter is inserted before the outside rim segments are placed. The hub is then completed, all joints are made good with clay and a wide cast iron ring, somewhat larger in diameter than the mould, is dropped over the latter and green sand rammed around the dry sand cores, as clearly shown in the cut. This method has proved highly satisfactory, the loss of a casting being an extremely rare occurrence.

Castings up to 11 tons in weight are frequently made in this foundry and the total output averages 85 tons per week. Belt pulleys from 26 in. to 48 in. in diameter are made on stripping plate pulley moulding machines and the output of the light foundry is nearly all machine work. It consists chiefly of standard parts, such as hangers. Conveyor stands, small hangers and similar castings are made on Pridmore drop plate machines, and there is a Pridmore stripping plate machine which is usually kept busy on 6-in. pulleys. A man can mould 170 of these pulleys on it per day of nine hours. All the machines are hand operated since the foundry is not yet piped for air. It is the intention in the near future, however, to instal an air compressor to supply the foundry and machine shop. A sand blasting outfit will be put in at the same time.

The foundry foreman's office is in an annex to the main building and behind it is a small room in which are placed the patterns from which castings have been ordered. Alongside the office is the men's wash room, etc., and above it is a comfortable room for use of the men during the noon hour. They can

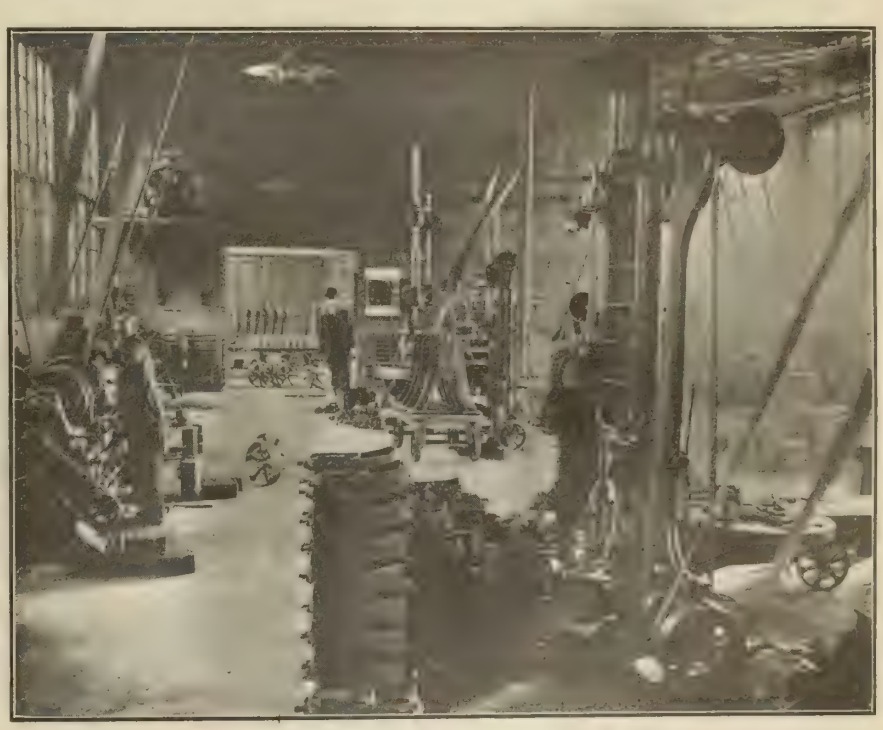

FIG. 10. A SECTION OF THE HANGER SHOP.

take their dinner here if they wish; and magazines, both technical and popular, are provided for their instruction and amusement.

Cleaning Department.

A study of the plan on page 26 will show that the light and heavy foundries each have their own cleaning departments to which the castings move by a straight route. There are really two cleaning rooms for the heavy foundry, the old hanger shop at the north end of the machine shop having recently been converted into a cleaning department, and it is here that the larger castings are fettled. In this shed there are three automatic pulley grinding machines. Two of these are special machines designed and built bp the Ford-Smith Machine Co., Hamilton, Ont. They have a capacity for pulleys up to 13 inches diameter by 18 inches face.

The Hanger Shop.

This is a new shop, built this year to relieve the main machine shop. As its name implies, it is chiefly, though by no means entirely, employed in machining and assembling hangers. It also looks after large couplings, take-ups, stock pulleys, etc. Standard bearings are also babbitted here. It is a well lighted shop with a concrete floor, 62 ft. by 40 ft. The principal machine tool equipment includes 24-inch Gisholt lathe, 36-inch and 45-inch vertical drill presses, 16-inch and 18-inch engine lathes, 24-inch engine lathe with taper attachment and turret head, 24-inch turret lathe, Baker keyseating machine and several small sensitive drills. These machines are all operated from one line shaft driven by a 20 H.P. motor.

From the hanger shop the work passes to the adjacent paint shop and thence to the warehouse. Part of this paint

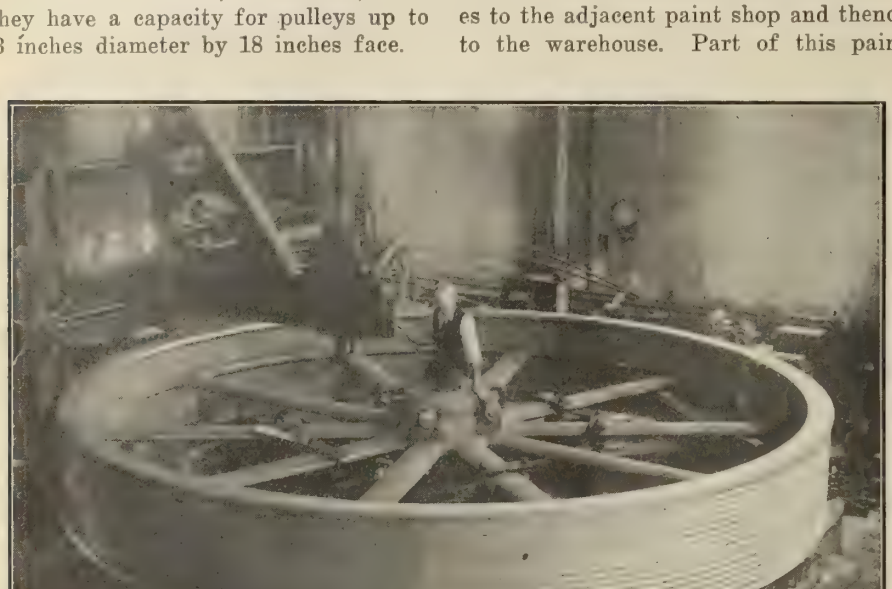

FIG. 11. A 20-FT. ROPE SHEAVE BEING BORED AND TURNED AT ONE SETTING ON A 10-20 FT. BORING MILL.

The main cleaning room, situated at the east end of the heavy foundry, is equipped with the usual grinding stands fitted with exhaust hoods. There are three tumblers 36 in. by 50 in., these being housed in a lean-to which is cut off from the cleaning room by swinging shutters. In this way dust is kept down to a very marked extent.

The cleaning room for hangers and other stock jobs is at the south end of the light foundry and adjoins the hanger machine shop. It is equipped with two tumbling barrels and ring wheel grinding machine with automatic traveling table, on which the bases of all hangers are dressed up true. This grinder was built by the Dodge Co. and turns out accurate work quickly and economically.

shop will be partitioned off for the air compressor plant which it is intended to instal.

The Machine Shop.

This is a well lighted building, 196 ft. long by 80 ft. wide. A monitor roof lights the centre bay, which is 40 ft. wide and is served by a 10-ton Morgan crane, similar to that in the foundry. The two side bays are 20 ft. wide and are excellently lighted by numerous side windows. An industrial track traverses the floor, but is not much used, as shop floor trucks are found to give a more flexible service both here and in the hanger shop. The machine shop floor is of an interesting type of construction. It is laid on six inches of tarred cinders, tamped to a level. On top of this is a 2-inch tongued and grooved pine floor spiked. On top of this, and running at right angles to it, is a 1-inch maple floor. This makes an excellent floor—dry, warm and durable.

The shop is divided up into well-defined departments, each with its necessary equipment of machine tools. Thus work on the Dodge and Orton clutches, of which the company turn out large numbers, is done in one corner, shafting is turned in another, while general assembling and fitting is done in a third. The machine tools occupy the body of the shop and are driven from line shafts, with the exception of a new 72-in. Bertram boring mill, recently installed, which has an individual motor drive.

Naturally in a shop of this description jigs and fixtures are very extensively used. Every possible operation that can be expedited by jigging has had a jig designed for it. This of course not only reduces the expense of manufacture, but also ensures that perfect interchangeability for which the Dodge Co. have earned an enviable reputation.

There are three shafting lathes all by the John Bertram & Sons Co. These are used for turning down from rough stock all shafting over 3 7-16 in. in diameter. Up to this size cold-rolled shafting is usually supplied. Shafts as long as 32 feet can be turned when required. They are turned from the black stock at one operation by a turning head attachment bolted to the carriage. This head is fitted with a bushing which is .0015 in. larger than the finished size of the shaft. After straightening and centreing, and before the turning head is attached to the carriage, the tailstock end of the shaft is turned down for a distance of 6 or 8 inches to fit the bushing. The turning head is now introduced over this end of the shaft and bolted to the carriage. The head is fitted with three tools. Two are on the headstock side, set one slightly behind the other and on opposite sides of the shaft, and the third (a finishing tool) is on the tailstock side. In this way the shaft is reduced from the rough to the finished diameter by one passage of the head, the first tool giving a roughing cut, the second an intermediate and the third a finishing cut. A first-class finish is obtained with a fairly coarse feed—6 threads per inch.

After being turned the shafting is polished in a special polishing lathe and tested throughout its length by a ring gauge. The ends are then turned down to a special gauge, to which the couplings are also bored. In this way absolute interchangeability of couplings is assured, and should one get broken a customer has only to wire the size of shaft to the Dodge Co. and promptly receive a new coupling, upon which he

will not require to do any work beyond pressing it on the shaft and driving in the key. This interchangeability has been brought to so fine a pitch in all Dodge products, that even their friction clutch members are produced in large quantities and taken from stock promiscuously as required.

In addition to their standard lines the company do a large amount of special work. Fig. 11 shows a 20-ft. rope sheave being turned and bored on a Betts 10-20 ft. boring mill with the housings moved back, and the handling of heavy work of this description is not looked upon as anything extraordinary.

Pulleys have their keyways cut in a Baker keyseater having a stroke of 27 inches. In the case of very wide faced pulleys, which will not go on this machine, the work is done on a 60-in. x 60-in. x 24-ft. Bertram planer by means of a special attachment. The latter consists of a large angle knee fitted with a bushing to suit a cutter bar. The bushing fits in a slide which can be moved vertically by a screw having the same pitch as that controlling the vertical movement of the planer cross rail. The clapper box is removed from the planer head and its hinge pin used to carry one end of the cutter bar, the other end of which passes through the pulley bore and into the bushing in the angle bracket. The latter is of course bolted to the planer table, as is also the pulley. The tool is fed vertically by means of the screws mentioned above.

The machine tool equipment is all of a thoroughly modern description, but does not call for any very extended notice. There are three pulley lathes of 20, 24 and 36 inches capacity respectively. Larger pulleys are turned on face lathes or on one of the three boring mills. There is an Ingersoll slab miller, chiefly used for keyseating shafting, two Bullard vertical turret lathes and a Bertram 72-inch full universal radial drill. These are merely mentioned to show that the equipment is of the best. There is also a full equipment of Acme bolt cutters and a Bertram 6-spindle nut tapper.

Pulleys up to 60 inches in diameter are balanced on an interesting machine designed and built by the Dodge Co. In this a horizontal mandrel, supported on ball bearings, carries the pulley. A vertical drill attached to a table having horizontal and vertical movement stands above the mandrel and can, of course, be raised or lowered to suit various pulley diameters. When the pulley is placed on the mandrel, with a sleeve to fit the hub, it oscillates and finally comes to rest with the heavy side at the bottom. The correct spot to drill the rim for a balance weight is thus brought automatically directly below the drill.

FIG. 12. INTERIOR OF MACHINE SHOP LOOKING NORTH.

This shop turns out a very large quantity of machinery for grain elevating and conveying and there is practically always work of this class on hand. Among other large elevators equipped in whole or in part by the Dodge Co. may be mentioned C.P.R. elevator, Port McNicoll; new annex of G.T.P. elevator, Fort William; Goderich Transit and Elevator Co.; Maple Leaf Milling Co., Port Colborne; G.T.R. elevators at Montreal and Tiffin; Harbor Commissioners' No. 1 elevator and a large part of their new elevator at Montreal.

An annex on the west side of the machine shop accommodates the tool room, office and lavatories. The tool room measures 46 ft. by 19 ft. and gives employment to about half a dozen men. The equipment is of the usual type and includes a Cincinnati No. 3 universal miller and a Bath No. 2½ universal grinder, together with tool-room lathe, shaper, drill grinder, etc. The numerous jigs for standard and special work are all made here and are stored in convenient racks. The foreman toolmaker is also responsible for the issuing of tools, gauges, etc., to the machine shop, the check system being used.

There is a spacious and well-lighted office next to the tool room for the foreman and the order clerks, and alongside this is the men's washroom. Above the latter there is a dining-room similar to that in the foundry and previously mentioned.

Waste cans are provided throughout the shops for oily waste and other rubbish and the men are encouraged to keep their machines and the shop generally in a clean and orderly state. A general suggestion box is also located in every shop, for the purpose of receiving any suggestions which employees may feel like addressing to the superintendent. This box is opened weekly and cash payment is made for any suggestion of value to the company, who do everything to encourage men to qualify themselves for advancement.

Outside the machine shop, at the north-east corner, is a shipping platform from which heavy or bulky material is loaded into the cars. Below this platform is a large power car haul, driven by a friction clutch from a line shaft inside the machine shop. This enables ten loaded cars to be pulled in either direction on any of the company's various sidings. These, by the way, aggregate a total of 1,500 ft., serving the coal storage bins and foundry yard, as well as the various lumber piling yards, making one of the most complete industrial siding services in the province.

The Warehouse.

This is a new brick building of three floors, erected in the summer of 1912. It measures 175 ft. by 47 ft. and runs at right angles to the hanger and machine shops, from which it is separated by about 20 feet. The building is in charge of a warehouseman who receives all in-coming goods and keeps up the stock, but has nothing to do with outgoing goods, which are looked after by the shipping clerk. Offices for both departments are on the ground floor which forms the shipping and receiving room and also accommodates the petty stores. The ground floor is of concrete, and the second floor consists of 8-in. by 2-in.

lumber flooring laid on edge and supported by 24-in. steel beams. On top of the 8 x 2 lumber is laid a tongued and grooved hardwood floor at right angles. It is designed for a load of 800 lbs. per square foot. The top floor is of similar construction, good for 600 lbs. It is formed of 6-in. by 2-in. lumber resting on 18-in. beams.

On arriving from the machine shop or hanger shop material is distributed to the shipping department or to the different floors of the warehouse. If it is for stock it will go to the second or third floor. On the second floor are stored hangers, bearings, couplings, pillow blocks, etc. The Dodge Co. make over two hundred different patterns of hangers and keep in stock about one hundred of each standard size of each type of hanger. Three styles of bearings are made, viz., ring-oiling, standard and capillary oiling, any one of which can be fitted to any standard hanger.

On the top flat of the warehouse are stored sprocket chain and attachments, take-ups, spiral conveyors and their fittings, steel split pulleys and their bushings, and also a large stock of solid and split cast iron pulleys.

Each floor is fitted with substantial shelves and racks for the convenient classification of the various stock parts. A Turnbull freight elevator, electrically operated, runs the full height of the building.

The Power House.

As previously mentioned the company purchase about 100 h.p. from the Toronto Electric Light Co., but generate 450 h.p. in their own power house. This is located behind the wood pulley factory which it was originally designed to drive.

The boiler house contains three return tubular boilers rated at 150 h.p. each. These were built by the John Inglis Co., Toronto, and are operated at 120 lbs. pressure. They are hand fired, the fuel used being a mixture of soft and semi-anthracite screenings. Natural draft is provided by a steel stack 48 inches diameter by 130 feet high. The boiler pressure is governed by an automatic damper installed by the McDonough Automatic Regulator Co., Windsor, Ont. One of the boilers consumes all the sawdust and shavings brought over by the exhaust blowers from the planing mill, etc.

The engine room contains a 100 h.p. tandem compound horizontal engine which has given excellent service for a good many years. It was built by the Osborne-Killey Co., of Hamilton, Ont. This engine drives the wood pulley shop by means of a Dodge rope drive. In addition to this there is a McEwen engine by the Waterous Engine Works Co., Brantford, Ont. This is direct connected to a Canadian General Electric D.C. generator of 100 K.W. capacity. This supplies current at 250 volts for the overhead cranes and for the lighting circuits in certain of the buildings. At one end of the engine room is a large fan for heating the dry kilns and the wood pulley shops by the Sturtevant system. All other shops are heated on the Webster system of direct radiation, the exhaust steam pipes and returns being taken across from the engine room to the main works through an underground tunnel across Pelham Avenue.

Fire Protection, Artificial Lighting, etc.

Every building on the plant is protected by a Grinnell automatic sprinkler system piped to the city water service. In addition to this there is an Underwriters' fire pump housed in a brick building alongside the boiler room of the power plant. This is a 18-10-12 duplex pump built by the Canada Foundry Co., and has a capacity of 1,000 gallons per minute. One-inch fire nozzles attached to 50 ft. of 2½-in. hose are located in suitable positions in each shop. The fire pump draws from a reinforced concrete tank of 100,000 gallons capacity. This tank is situated underground alongside the pump house and holds city water held in reserve for fire fighting purposes only. The ordinary water service throughout the plant is derived from the city mains; but as precaution against temporary failure of this supply there is a large tank on the third floor of the wood pulley shop, which holds half a day's supply.

Artificial lighting is carried out in the manner best suited to the individual needs of the different shops. Thus in the pattern shop and wood pulley department 16 c.p. drop lights are used. The foundry is lighted by enclosed arc lamps, supplemented by drop lights in the core making and bench moulding departments. The hanger shop, machine shop and warehouse are illuminated by 100-watt tungsten lamps. In the machine shop these are arranged in clusters under enamelled reflectors with fine effect.

The Executive Offices.

To run this extensive business the Dodge Co. maintain a highly systematized staff, who occupy comfortable quarters in a handsome two-storey office building of red pressed brick. The staff is divided into a number of departments, each under the supervision of an expert. These divisions include the accounting department, equipped with modern labor-saving devices such as listing and adding machines; the order department, which is in charge of a man of many years' experience in the company's works; the purchasing department; the sales department, in charge of an expert who has full supervision over travelling salesmen, agencies and sales generally; the charging and billing department, where again the most modern methods are in vogue; and the publicity department, which is fully manned and equipped for the regular sending out of the company's continuous flow of advertising literature, which is sent out monthly from coast to coast. This includes the periodical issue of a very complete catalogue which describes and illustrates the full line of Dodge products.

On the second floor of the office building is the engineering department under the charge of a chief engineer of many years' experience, who superintends a

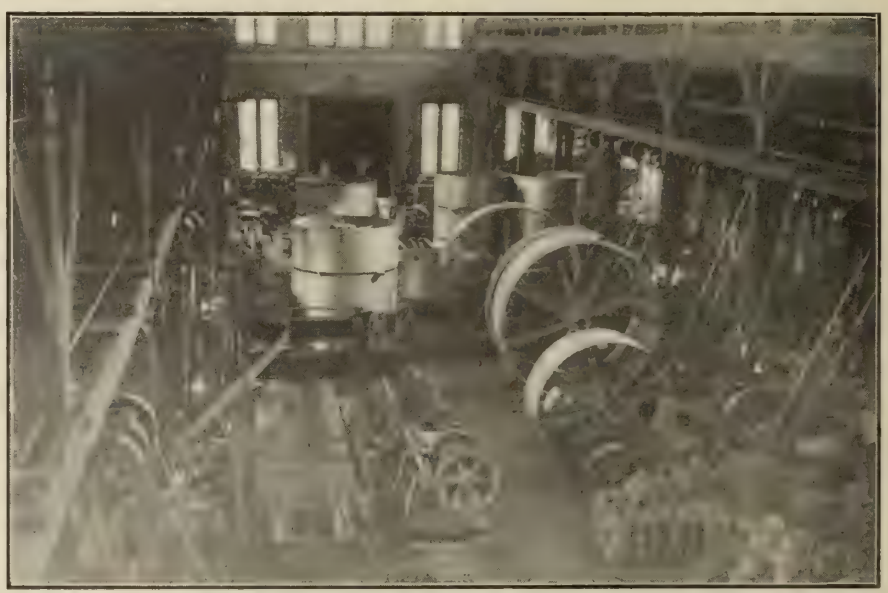

FIG. 13. INTERIOR OF MACHINE SHOP LOOKING SOUTH.

large staff of draftsmen. Here are laid out and designed the various large and complete equipments of machinery for the many grain elevators fitted out by the Dodge Co. In a fireproof vault in this department are stored all the company's drawings and records, which represent an immense outlay of money.

Next comes the very complete cost-keeping department, where the cost of everything made by the company each day is actually computed from the cost of the raw material to the "cost sold" price. There is also an estimating department which provides the sales department with "cost sold" figures on all proposals.

This, in conjunction with a modern telephone and autocall system connecting all departments, tends to make Dodge service most complete. After working hours the office telephone is connected with the superintendent's house, which is on the premises. By such means as this the company's customers are given a 24-hours-a-day service and can rely on obtaining spare parts to make good a breakdown with an absolute minimum of delay.

World-wide Agencies.

The Montreal warehouse constantly carries a stock valued at $40,000. This enables it to replenish eastern agents' stock in addition to looking after the Montreal and local eastern markets.

The Dodge split wood pulley was introduced into Great Britain in 1886, in which year it was exhibited at the Indian and Colonial Exhibition in London. The exhibit attracted great attention and resulted in the award of a diploma to the Dodge Co. This was the beginning of a business that has now grown to very large proportions.

In addition to being strongly represented in Great Britain, the company has agents in South Africa, Australia, New Zealand and the Argentine Republic. In Canada every principal city from coast to coast has its Dodge agency carrying a full line of the firm's products.

Such a large and comprehensive business has not grown up in a day. It is the result of nearly thirty years' strenuous work on the part of the management, who have always aimed at rendering a distinct service in the direction of supplying standardized interchangeable products. This end they may now be fairly said to have attained.

PROTECTION FOR TIMBER LANDS.

THE Canadian Board of Railway Commissioners has recently prescribed regulations for the prevention of fires and for regulating the operation of locomotives during the dry season in the province of British Columbia.

This order provides that every locomotive must be fully equipped with spark arresters of a specified size, with sheet-iron dampers, overflow pipes and division points. The company must examine, at least once a week, the nettings, dead plates, ash pans, dampers, slides and fire-protective apparatus of each locomotive, and keep a record of each inspection for the Government's special inspectors who are to make an independent monthly examination. The board of railway commissioners is given power to remove from service any locomotive found defective in fire-protective apparatus. The roads are prohibited from burning lignite coal without special permission from the board, and between April and November, the burning of ties and other refuse along the tracks is forbidden. Any fire starting or burning within 300 feet of the railway track shall be presumed to have started from the railway.

A measure is being discussed by those interested in the protection of Maine timberlands from fire. It will probably be introduced in the legislature of that State during the coming winter. If passed, it will give the State Board of Railway Commissioners authority similar to that held by the Canadian Board.

ONTARIO'S GREAT WEALTH.

NORTHERN ONTARIO, its vastness, its productive capabilities, its wealth of mineral and timber, its fish and its fur, its fertile lands and the importance of the development of Ontario to Toronto, Older Ontario and the Dominion, was the subject on which Hon. W. H. Hearst, Minister of Lands, Forests and Mines in Ontario, addressed the members of the Canadian Club recently.

Ontario has been much talked about but no speaker of recent years warmed up to his subject with more vigor and effect than did the Hon. Mr. Hearst. The vastness of New Ontario and the immensity of its wealth was presented as never before.

Millions of Acres.

New Ontario comprises, the speaker said, Nipissing, Algoma, Thunder Bay, Rainy River and Kenora. Millions of acres of land were awaiting the settler in the rich clay belt. The diversified character of its products was sufficiently large to take in everything grown in Older Ontario, even to its finest fruits. Ontario's millions of acres under cultivation yielded her $13,000,000 more than the combined field crop of the two important provinces of the West. New Ontario is equivalent to sixteen times the area of older Ontario. Blessed with easy access to the markets of the world, Ontario was destined to become the greatest Province of the greatest Dominion of the greatest Empire. It was destined to be the greatest paper making, ore and steel country in the world.

Opening Up North Land.

The Canadian Northern, the G.T.P., and the Temiskaming and Northern Ontario Railways, were opening up large tracts of the finest lands in the world to the settler. During the past year, 1,400 settlers went in upon this land, and their success was drawing others. The possibilities of the future were, Hon. Mr. Hearst said, but slightly indicated by the work of the settler to date. However, 62,444 farms were available in the 20,000,000 acres of fertile soil.

Interesting Statistics.

With statistics at his finger ends, Hon. Mr. Hearst appeared to his large audience to be a veritable encyclopedia of areas, revenues and productions. New Ontario has 3,453 miles of railway of which 1,000 is C.P.R., 761 National Transcontinental, 1,043 Canadian Northern, 253 T. & N. O., Central Algoma 336, and Algoma Eastern 60, all opening up the best land in the Dominion. In spite of all this, the province was inadequately supplied with railways.

The red and white pine on Crown lands in Ontario was estimated to have a value of $135,000,000, and that on licensed lands $10,500,000, while the value of pulp wood fit to cut was $225,000,000, or a total from timber alone of $370,500,000.

Output of Mines.

The total output from the mines of New Ontario for the nine months ended Oct. 31, was close upon $25,000,000. Of this $1,117,335 was gold. In 1911, the output of nickel matte was $3,664,474; refined nickel, $10,229,623; copper matte, $1,281,118; refined copper, $2,219,264; pig iron, $7,716,314; steel, $9,505,013.

Water Powers.

The water powers of Northern Ontario was another element in its wealth. The capacity of the powers already are known to be over 2,000,000. The great growth of its population, especially in the Temiskaming district, where there are now 75,000 people, compared with 5,500 a few years ago, he regarded as one of the best tests of the great possibilities of Ontario.

No other province in the Dominion held out to the settler so much in the way of inducement as Ontario, he said, and no Province in the Dominion was capable of so much. Five million dollars was being expended by the Government in roads, etc., in the new districts.

CANADIAN IRON ORE OUTPUT.

THOUGH according to an official report recently issued, Canadian blast furnaces produced 15 per cent. more iron and 8 per cent. more steel in 1911 than in 1910, the output of ore by the mines of the Dominion has decreased. In fact only about 6 per cent. of the iron ore used in Canadian blast furnaces was of domestic origin and the rest imported.

The pig iron output for 1911 was 917,535 short tons, valued at $12,307,125, compared with 800,797 short tons, valued at $11,245,622 in 1910. The increase is 14.6 per cent. Steel ingots increased by 7 per cent., the figures being 882,396 tons and 822,284 tons.

Iron ore shipments were 210,344 tons, valued at $522,319, compared with 259,418 tons, valued at $574,362.

The report states that the rate of production has shown practically no increase in the last twelve years. In the same period the output of pig iron has increased about tenfold.

MONTREAL HARBOR REVENUE.

THE revenue returns received at the Harbor Commissioners' office give a total revenue for the navigation season of $461,396.43 as compared with $430,623.24 for the navigation season of 1911, an increase of $30,773.19. This total has been made up of the following increases: Wharfage inwards, $6,000; wharfage outwards, $5,500, and from local traffic, $19,273.19. There has been a decrease of 26 in the number of seagoing vessels entering the port during the past season compared with the arrivals during 1911. The number for the past season was 736, as against 762 for the navigation season of 1911, but there has been an increase in tonnage, the figures being 2,403,924 tons for 1912, as compared with 2,338,252 tons for 1911, an increase of 65,672 tons.

CANADIAN NORTHERN RAILWAY.

THE report of the Canadian Northern Railway Co. for the past year, which was submitted at the annual meeting of the company, is a very interesting and satisfactory document for the shareholders in the concern, for the year just closed shows a very considerable development of the work of the company, as well as a remarkable advance in construction work. No fewer than 586 miles of new construction work was added to the already extensive system, and the average mileage worked was 3,888 miles. Generally speaking, the freight carried showed a substantial increase, while the commercial coal carried increased from 370,160 tons to 804,803 tons, which shows the very rapid increase in Western Canadian coal mining.

One of the most satisfactory features of the report is that which relates to the carriage of building material, for as buildings are only erected in Canada when they are required, the increase in the carriage of building materials by 48 per cent. is a most encouraging sign for the future prosperity of the Canadian Northern Railway, along whose line settlements are springing up with gratifying rapidity. A very good report of the progress of the general development of the company is to be found in the report, and is confirmed by the speech of the chairman at the annual meeting. The linking up of the lines of the company in the northern system of the eastern provinces with the Western Canadian lines of the company is progressing most satisfactorily. The outlook is equally promising, for the crop movement indicates a yield greater than in any previous year, and this, coupled with the fact that the market is satisfactory, is surely indicative of a substantial increase of revenue. It is true that operating expenses are on the up grade, but despite this fact, the latest returns since the close of the company's year indicate a still further expansion in the net earnings.

PROVINCE OF ONTARIO MINERAL OUTPUT.

THE annual report from the Bureau of Mines for 1911, recently issued, shows the total mineral production for Ontario to amount to $41,976,797, an increase of 6.7 per cent. over the previous year, while during the six years ending 1911, the mineral output of the Province was increased by 87 per cent.

Silver and pig iron accounted for most of the increase, as nickel, copper, iron ore and gold showed a slight falling off. The reduction in the nickel output was $341,861, while the others decreased in a much lesser degree.

Non-metallic products, particularly natural gas, showed a large increase, while there was a decrease in petroleum, lime, mica, calcium carbide and corundum. All building products, with the exception of lime, were produced in greater quantity and larger value.

An increasing proportion of Ontario ores are being refined in the Province, and last year 60 per cent. of the silver production was refined at home, while the balance was principally low-grade ore.

LACHINE CANAL STATISTICS.

THE Lachine Canal, which opened for 1912 on April 29 and closed on December 5, had a busy season. The records show an enormous increase in the quantity of wheat passing through it, while, in nearly every other class of freight, there was a gain.

The grain and produce carried during the year were as follows:

	1912	1911
Wheat (bush.) ...	24,345,435	18,220,411
Indian corn (bu.).	289,914	4,600,628
Oats (bush.)	9,671,815	8,163,371
Barley (bush.) ...	881,399	622,040
Rye (bush.)	25,500	.....
Flaxseed (bush.).	758,963	207,699
Flour (tons)	456,059	*1,003,039
Eggs (cases)	17,774	14,032
Butter (pkgs.) ...	5,466	6,712
Cheese (boxes) ..	250,340	242,859
Apple (brls.)	55,169	41,293

*Sacks.

One hundred and seventy-two Canadian and 44 American steam vessels passed through the canal, with 771 barges, canal boats and schooners. There were 9,560 separate trips with a combined tonnage of 4,119,364; 6,125 permits were issued to boats compared with 5,738 last year while the passengers carried numbered 89,557.

Two hundred and three yachts and 223 tugs had canal permits; 432,478 tons of coal passed through, while 439,517 tons were landed at points on the canal banks.

There were 960 inward trips of St. Lawrence River ships to discharge cargo in No. 1 basin, or at Cote St. Paul, while 17,357 cords of pulpwood were carried to Canadian ports and 64,403 cords to United States harbors. Of pulp, 28,302 cords went to American ports, and 1,040 cords to Canadian ones.

C. P. R. GRAIN FIGURES AT FORT WILLIAM.

THAT the Canadian Pacific Railway has handled more car loads of grain in 1912 at Fort William, than ever before, is clearly demonstrated by the following official data received at the C. P. R. headquarters. The figures are also evidence that the company is doing its utmost to prevent congestion at the head of the lakes, and has so far been successful. The returns for the month of November show that 54,314 cars were handled, being a daily average of 1,810. During the corresponding month in 1911, 41,171 cars were handled, or a daily average of 1,405. Unloaded at the elevators were 16,560 cars of grain or an average of 552 daily, as against 12,409 for the same period last year, equal to a daily average of 414.

Hamilton Bridge Works Co. New Plant, East Hamilton, Ont.

Staff Article

Canada's unprecedented development during the past few years has kept all branches of the iron and steel industries working at their maximum capacity, in an earnest endeavor to overtake their orders. In common with other manufacturers, bridge builders have had a busy time and have found difficulty in keeping pace with the requirements of the railways and of the highways authorities. This article describes the first unit of a new plant recently erected by one of the oldest bridge building firms in Canada, with a view to coping with an ever increasing flow of business.

AS builders of railway bridges, railway turntables, highway bridges and structural steel work generally, few firms in Canada are better known than the Hamilton Bridge Works Co., Ltd., who have been established at Hamilton, Ont., for upwards of forty years. The company have steadily advanced step by step with the development of the country, and the products of their shops may be found in every province from the Atlantic to the Pacific.

Owing to the enormous demand of late years for all kinds of structural steel work they have for some time been hard put to it to keep ahead of their orders. About five years ago the works were entirely rebuilt and remodelled, with the result that the yearly output was trebled. But even this proved merely a temporary remedy, and it was recently found imperative to still further increase their manufacturing facilities in view of the large amount of business offering.

The main works are situated in the north-western portion of the city and cover an area of about 8 acres, every square foot of which is fully occupied; so that any further extension was rendered impracticable. Consequently it was decided to erect a large modern plant at the east end of the city. An advantageous site of 20 acres was secured, having direct communication with the Grand Trunk, the Canadian Pacific and the Toronto, Hamilton and Buffalo Railways. The proposed new branch of the C.N.R. will also probably connect with the site.

The new plant has been specially designed for heavy truss and girder work and is occupied entirely with this work, the bolt and rivet making departments and machine shop being still located at the company's up-town plant.

Layout of New Plant.

So much of the new plant as is already built and in operation merely forms a first unit, the layout having been very carefully arranged to allow of extensions in all directions to the full capacity of the site. This first unit comprises three buildings and a stock yard, together with the necessary railway spurs. The stock yard is at the east end of the structural shop.

Of the three buildings, the first to be noticed is that containing the air compressor room, boiler room, and template and pattern shop. This is a one storey brick building, 180 ft. by 50 ft. The roof is carried by steel trusses and has a 20 ft. monitor. The compressor room and boiler room have floors of concrete, while the template shop floor is of 2 x 4 in. lumber, laid edgeways upon steel beams spaced at 12 ft. centres. On top of this is laid a 1-inch pine wearing

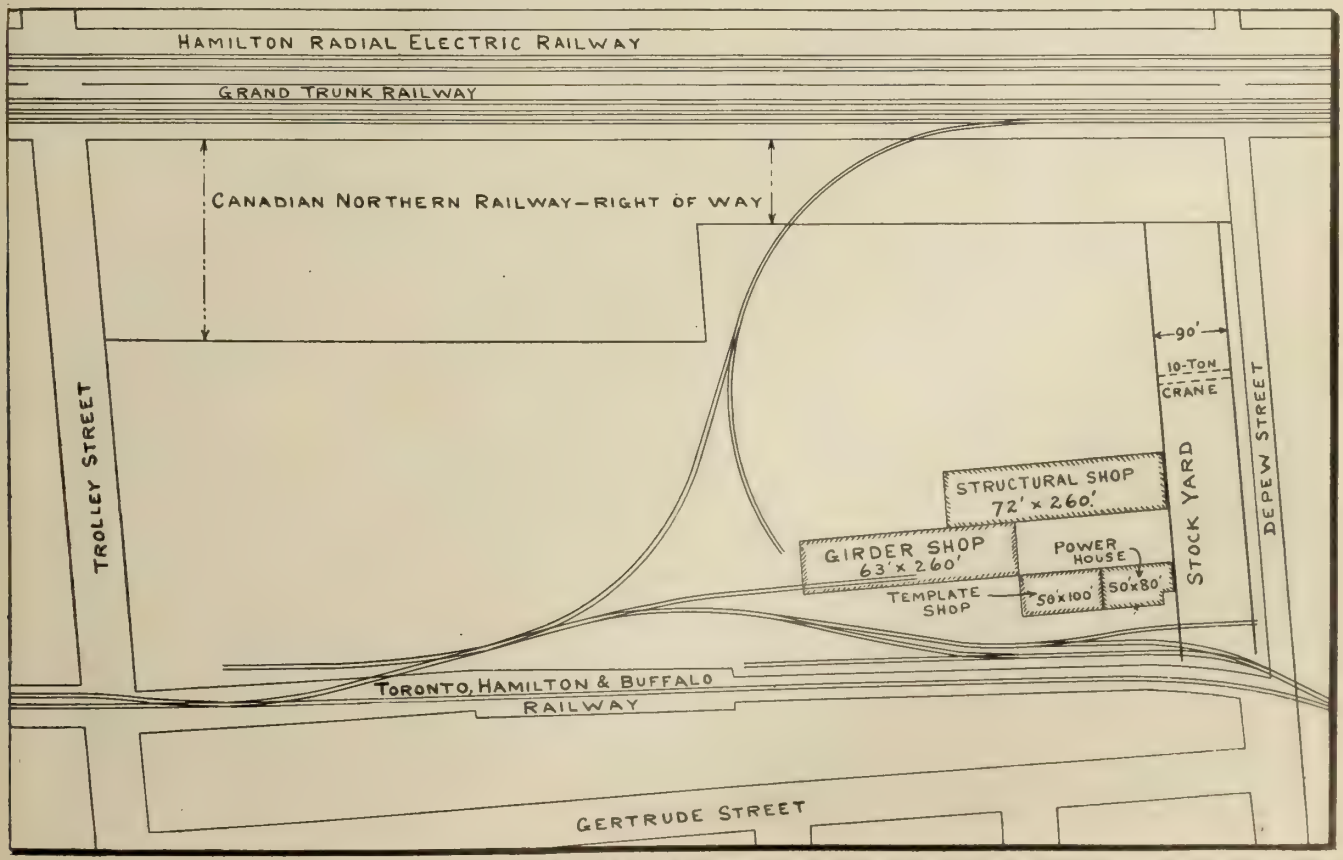

FIG. 1. LAYOUT OF NEW SITE, SHOWING THE LARGE AMOUNT OF SPACE AVAILABLE FOR FUTURE EXTENSIONS. HAMILTON BRIDGE WORKS CO., LTD.

floor. The steel joists rest on concrete piers, the whole forming a warm, dry floor. The window area is unusually large, with steel sash throughout; so that excellent natural lighting is secured.

The second building forms the structural shop. It measures 260 x72 ft. and has self-supporting steel frames covered in with corrugated sheeting. The head room to the underside of the roof trusses is 21 ft. The roof consists of 2-inch matched sheeting covered with tar gravel, and the floor of 4x6 in. red pine planks laid on 4x4 in. stringers. The latter, spaced at 3 ft. centres, are bedded in cinders. The building runs east and west and has six roof monitors running at right angles to this direction. The reason for the latter feature lies in the fact that the building will eventually be extended in a northerly direction and the monitors will then form the principal source of light for the centre of the shop; hence the importance of having them run east and west.

Each of the roof trusses in this shop has been designed to carry two 5-ton air hoists and there are also three lines of beam runways running longitudinally and equipped with 3-ton chain blocks. In addition there is a 15 ft. runway for four 3-ton hand operated travelers on the north side of the shop.

This structural shop contains all the heavy machines, as will be later detailed.

frames and large steel sash windows. The south side is of brick up to the window sills, but the other three sides are merely covered in with corrugated sheeting to allow of future extension.

FIG. 2. VIEW OF STOCK YARD AND EAST END OF STRUCTURAL SHOP.

Girder Shop.

The third building forms the girder shop and stands between, and to the west of, the other two. Like the structural shop, it has self-supporting steel

This shop measures 260 x 63 ft., with 32 ft. 6 in. of head room under the trusses. It is served by two 30-ton Royce 3-motor traveling cranes of 59 ft. span, in addition to which a runway has

FIG. 3. INTERIOR OF STRUCTURAL SHOP LOOKING WEST. IN THE FAR CORNER IS SEEN THE 80 FT. OPENING INTO THE GIRDER SHOP. ILLUSTRATION SHOWS LONGITUDINAL TRAVELLERS FOR RIVETERS AND AIR HOISTS RUNNING CROSSWAYS ON LOWER CHORDS OF ROOF TRUSSES.

been provided along the north side for 10-ton wall cranes. Two of the latter have already been installed and are used for carrying the heavy pneumatic gap riveters.

An interesting feature of the building is an 80 ft. steel truss, which spans the opening from the structural shop. This truss is of the lattice type and is 17 ft. 3 in. deep. In addition to carrying the weight of 65 ft. x 80 ft. of roof, it also supports three 5-ton air hoists and the runway for the 30-ton cranes in the girder shop. This 80 ft. opening has a head room of 22 feet and allows ample room for transferring large members from the structural shop.

A standard gauge track runs in at the west end of the girder shop, enabling the 30-ton cranes to load the heaviest members direct on to flat cars. All shops are fully served by industrial tracks of 30-inch gauge.

Raw material is taken from the stock yard at the east end of the shops and passes through step by step to the west end of the girder shop, without change of direction. The machine tool equipment is all of the latest type and is mostly contained in the structural shop. At the south-east corner of this shop there is a 5-roll set of combination bending and straightening rolls by Wickes Bros., Saginaw, Mich. These are used for straightening plates as they pass into the shop from the stock yard, and will take stock 11 feet in width. They have two feeding rolls and three bending rolls, and are so arranged that the feeding rolls may be dropped to allow of bending plates for tank work, etc.

Along the south side of the structural shop there is a 42-inch multiple punch by the Canada Machinery Corporation. This is equipped with a Thomas spacing table, which will take any plate up to 75 feet in length and 42 inches in width. There is also a No. 6 bulldozer by Williams, White & Co., Moline, Ill. This is at present temporarily located in the girder shop, but will eventually be removed to the structural shop when the latter is extended.

FIG. 4. GIRDER SHOP, LOOKING EAST. ON THE LEFT MAY BE SEEN THE 80 FT. OPENING FROM THE STRUCTURAL SHOP.

FIG. 6. ELECTRICALLY OPERATED BASCULE BRIDGE, WITH 60 FT. DECK PLATE GIRDER SPAN, OVER THE TRENT CANAL AT LINDSAY, ONT.

FIG. 7. THROUGH RIVETED LATTICE GIRDER SPAN AND THROUGH PLATE GIRDER SWING SPAN (IN THE DISTANCE), ERECTED OVER RIVER THAMES, AT CHATHAM, ONTARIO.

Further equipment includes a 16-ft. plate edge planer by Hilles & Jones; an 84-in. gate shear with capacity to 1¼-in. plate, by the Canada Machinery Corporation; a Bertram double ended punch and shear, with 24-in. and 36-in. gaps; a 48-in. Hilles & Jones punch; a Bertram double angle shear, with ca-

FIG. 5. GIRDER SHOP, LOOKING WEST. HERE IS SEEN UNDER CONSTRUCTION A A 240 FT. RIVETED THRO UGH LATTICE RAILWAY SPAN.

pacity to 8 x 8 x 1 in. angles; a Pells beam cutter for 24-in. I-beams; and a 52-in. rotary planer with 8-ft. saddle traverse, by the Canada Machinery Corporation. These machines all have individual motor drives and have been laid out to the best advantage for handling the work in the shop. In addition to the above tools there are a few smaller machines, such as a 48-in. radial drill, 18-in. engine lathe, grinders, etc. These are located along the east end of the girder shop and are driven from a line shaft.

FIG. 8. DERRICK CAR ERECTING 80 FT. SINGLE TRACK GIRDER SPAN.

The rivet forges all burn fuel oil. They were supplied by F. Hyde & Co., Montreal, and are fitted with the Jacobs' burner. The latter are at present adjusted to use high pressure air. As the plant is extended, however, a low pressure system will be installed.

The oil distribution system is in duplicate, the piping being laid in iron casings underground. Provision is made for steam heat in winter to prevent the oil from thickening.

Reamers, Pneumatic Tools, etc.

In addition to a number of pneumatic reamers, there are two Van Dorn and Dutton electric reamers. There are also four radial wall reamers in the structural shop and four portable radial reamers in the girder shop. These were designed and built by the company and have their spindles driven by a worm and gear, instead of by the usual bevel gears.

The pneumatic tools include two 48-in. and one 36-in. Hanna riveters; one 24-in. and one 36-in. riveter by the Shepard Electric Crane & Hoist Co.; and one column riveter by the same firm. The air motors, drills, chipping hammers, etc., were supplied by the Chicago Pneumatic Tool Co., while the numerous air hoists throughout the plant are of the Canadian Ingersoll-Rand Co.'s make.

Power Plant.

Air for these tools is supplied by a horizontal two-stage Bury air compressor, having a capacity of 700 cubic feet of free air per minute. It is belt driven by an induction motor of 125 h.p. The compressed air, at 90-100 lbs., is taken to a receiver and from thence by an underground main to a central point in the shops. From here it goes to the roof and is distributed by drop pipes to various points as required.

Power is purchased from the city hydro-electric system, current being received at 2,200 volts and stepped down to 220 volts by three static transformers, each of 300 k.w. capacity. The power plant equipment also includes a motor-generator set of 75 k.w. generator capacity. The generator is direct driven by a 100 K.V.A. synchronous motor, this type being of course used to improve the power factor. This motor-generator set provides direct current for the lighting circuits and for the crane motors.

Artificial lighting in the template shop is by 100-watt tungsten lamps suspended from the roof trusses, with individual drop lights where special illumination is required. The girder shop and structural shop are lighted by Canadian General Electric Co.'s D.C. flaming arc lamps, placed above the bottom chords of the roof trusses.

Progress of Plant.

The site was staked out on October 10, 1911. By January 1, 1912, the brick building now containing the template shop and power house was closed in, permitting the foundations for the air compressor and the electrical equipment to be put in. The steel for the structural shop was built at the company's up-town plant and everything was sufficiently far advanced by May 1, 1912, to start manufacturing.

The first work turned out by the new plant was the steel for the girder shop on which erection work was pushed rapidly forward, so that it was ready for the cranes by August 1. The shop was in complete operation by September 1, since which time the plant has turned out about 2,000 tons of work.

The yard tracks are served by a locomotive crane which has been on the site from the very beginning of operations and greatly expedited the work of erecting the buildings.

Examples of the Company's Work.

Some of our illustrations give an idea of the appearance of the new plant, while others show good examples of work turned out by the company.

Fig. 6 shows a bascule bridge, with 60 ft. deck plate girder span, over the

FIG. 9. ERECTION CAR PLACING 100 FT. DECK PLATE GIRDER IN POSITION.

Trent canal at Lindsay, Ont. This is an ordinary type of Strauss bascule trunnion lift bridge, but is of interest as being probably the first highway bascule bridge, if not the first bascule of any kind, erected in Canada. During the last two or three years, however, a considerable number of railway bridges of this type have been built.

Fig. 7 shows a through riveted lattice girder span and through plate girder swing span recently erected by the company on the line of the Canadian Pacific Railway over the River Thames at Chatham, Ont. The lattice span is 157 ft., and the swing span 120 ft. in length. Both were specially designed for heavy main line traffic.

Fig. 8 shows a steel trestle on the line of the Georgian Bay and Seaboard Railway,—a branch of the C.P.R. from Victoria Harbor to Burketon Junction, Ont. This was recently erected by the Hamilton Bridge Works Co. over the Skugog River. The illustration shows one tower and span, and also one approach span, erected complete. One of the company's large standard derrick cars is seen in the act of erecting an 80-ft. single track girder span. This is the company's regular method of erecting work of this kind and the cut shows the operation very clearly. The same style of derrick car is seen in Fig. 9, placing a 100-ft. deck plate girder span on the line of the National Transcontinental Railway over the Missinabi River, about 100 miles west of Cochrane, Ont. It will be noticed that the steel structure in course of erection replaces a temporary wooden bridge which had previously carried construction traffic on this line.

Fig. 10 illustrates the Hamilton Bridge Works Co.'s method of erecting steel frame buildings. The example here shown is a warehouse and paint shop recently put up for the Oliver Chilled Plow Co., of Canada, at Hamilton, Ont. The cut clearly shows the steel traveler by means of which all three bays of the building were erected simultaneously. The total weight of steel in this structure is 1,800,000 pounds, the whole of which was erected in 30 days.

Personal.

The new east end plant is under the supervision of Mr. E. H. Darling, C.E., who is the resident engineer in charge of the design, construction and operation of the plant. Mr. Chas. M. Strubel is shop superintendent. The company's chief engineer is Mr. R. K. Palmer, and Mr. W. G. Milne is plant engineer. The executive officers are as follows:—

Hon. John S. Hendrie, C.V.O., President.

Wm. Hendrie, Esq., Vice-president.

R. Maitland Roy, Esq., C.E., General Manager.

The company were so busy during 1912 on railway bridge work for the Canadian Pacific, Grand Trunk, National Transcontinental, Canadian Northern Ontario Railways that they were able to accept very few orders for highway bridges, structural steel work, etc., but were compelled to confine their attention almost entirely to railway work.

This condition of affairs will be greatly relieved in 1913 by the new plant. Orders on hand ensure the latter being kept busily employed all year.

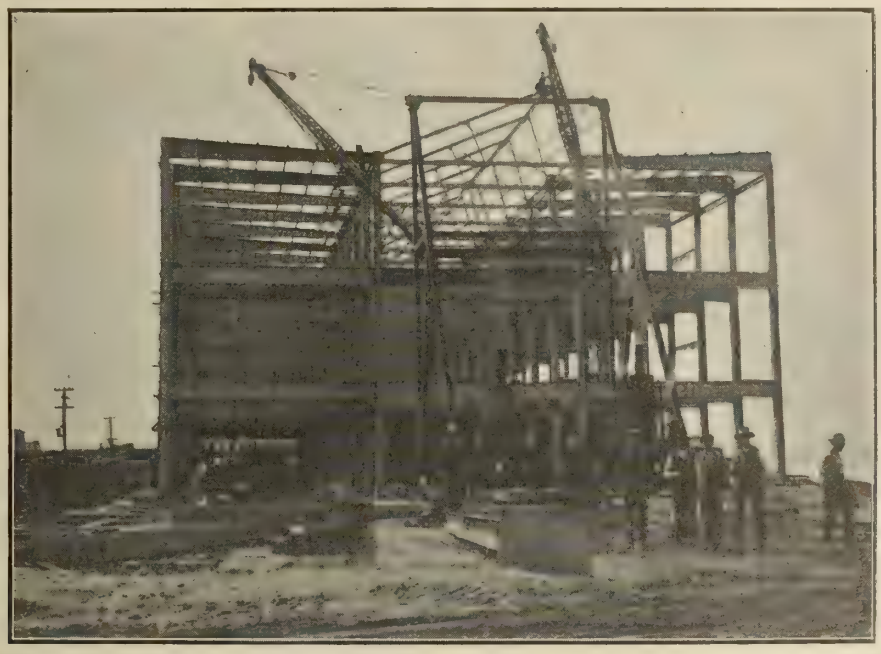

FIG. 10. METHOD OF SIMULTANEOUSLY ERECTING THREE BAYS OF A STEEL FRAME WAREHOUSE.

WESTERN WATER POWERS.

THE Prairie Provinces' water-powers upon which fairly definite information is available are mostly all confined to the southern portion of each. This is a rather unfortunate coincidence, and is likely to mislead the uninitiated regarding the total potentialities of these provinces, as the larger water-powers are situated in the north, on the Athabaska, Peace, Slave, Churchill, Nelson and other rivers.

As even a preliminary survey of these rivers will be of great value, the Commission of Conservation has undertaken this work. During the last two summers, its Hydro-Electric Engineer, Mr. L. G. Denis, has been in the field making measurements of flow, height of falls, etc., and last year the many rapids of the Athabaska River were investigated and the flow of the Peace and other rivers measured. This year, the work included many long miles of travel, mostly by canoe, the western limit of the trip being the Peace River canyon in the north-eastern portion of British Columbia, while the northern limit was Fort Smith, on the Slave River.

On the return trip, the several rapids and falls in the Clearwater River and the upper waters of the Churchill were investigated. The general impression created by these large northern water-powers is that they will undoubtedly become of great value in connection with the wood-pulp industry. The raw material is close at hand, the only retarding factor, at present, being the lack of means of transportation and access. The details obtained by these investigations will be included in the Commission's forthcoming report on the "Water-Powers of Western Canada."

CANADIAN CAR & FOUNDRY CO.

THE third annual report of the Canadian Car & Foundry Co., Montreal, for the fiscal year ended September 30, issued to the shareholders on December 9, shows that the gross sales for the year were $16,500,000. The profits for the year, available for dividend purposes after providing for the first instalment of the bond sinking fund, as shown by the profit and loss account, were $1,040,000.

At the close of the fiscal year, the unfilled orders amounted in value to over $15,000,000, and at the date of the report, the value of unfilled orders is $16,000,000.

PETROLEUM RESOURCES OF CANADA.

WHILE the actual petroleum resources of Canada are comparatively small, nevertheless the potential resources are considerable.

In New Brunswick and Nova Scotia there are enormous deposits of oil shales which are valuable as a source of oil. On an average, these shales will give a higher yield of crude oil per ton than the oil shales worked so extensively in Scotland.

In the vicinity of Fort McMurray and Fort McKay on the Athabaska River, Alberta, there are enormous deposits of tar sands. The bitumen in the tar sand is the residue from evaporated petroleum, and it has been estimated that there are 6½ cubic miles of solid bitumen in the tar sands exposed on this river. Although enormous quantities of oil have evaporated from this district, nevertheless it is probable that accumulations of petroleum exist where the geological structure was such as to prevent its escape. This is also substantiated by the fact that natural gas occurs in quantity in districts where the tar sands are capped by overlying measures.

If large quantities of petroleum were discovered in Alberta, it would be a factor of great importance to the railway interests which operate in the Rocky Mountains and Jasper Parks, and in other forest areas in British Columbia and Alberta.

Oil as a Locomotive and Marine Fuel.

The Canadian Pacific Railway is now using oil-burning engines on its main line between Kamloops and Field in British Columbia. The Grand Trunk Pacific and some of the Canadian Pacific coast steamships also burn oil, and other boats are being changed from coal-burners to oil-burners. The oil is obtained from the California oil-fields. If supplies can be obtained at the prices now prevailing, its use will be very largely extended. Its cleanliness, the greatly decreased smoke, the decrease in the number of firemen required, the economy particularly in intermittent service, the increased efficiency—two boilers with oil, in steamship service, giving same steam as three with coal—and other considerations, make it an almost ideal fuel.

INDUSTRIAL ACCIDENTS.

ACCORDING to the record of industrial accidents maintained by the Department of Labor, there were 104 workmen killed and 324 injured during the month of October. Compared with the record for September, this is an increase of 15 in the number killed and a decrease of 95 in the number injured. The greatest number of fatal accidents occurred in steam railway service, there being 28 employees killed. The building trades come next with 18 fatalities. Of the non-fatal accidents, the greatest number occurred in the metal trades, the number recorded being 85, followed second by building trades with 40 injured, and third by steam railway service with 37 injured.

RAILWAY EQUIPMENT PLANTS.

THE larger locomotive plants are all booked up with orders for some time ahead and it was recently stated that at the present time every Canadian company could have additional orders if they could guarantee deliveries.

Since its re-organization in June, 1911, the Canadian Locomotive Co. at Kingston has turned out 90 locomotives, 20 of them being of the consolidation type for the C.P.R., and 25 of the same type for the Canadian Northern.

In the last year, the Montreal Locomotive Works have turned out 425 locomotives, among which were 108 ten-wheelers for the C.P.R., 60 ten-wheelers for the Canadian Northern, 60 consolidated for the C.P.R., and 75 Pacifics for the C.P.R. At the present time the C.P.R. seems to have orders placed in every equipment and locomotive company in the country, and at the same time is operating its plants on day and night shifts.

The difficulty being experienced by the large Canadian railways in getting deliveries of equipment has also resulted in the new companies getting some big orders to fill, just as fast as they can turn them out.

The new National Steel Car Co., of Hamilton, Ont., have already received orders for 1,500 cars, while the new Nova Scotia Car Works have orders on hand for 2,500 cars.

CANADIAN CENSUS OF MANUFACTURES.

THE official statistics of the census of Canadian manufactures for the year 1910, which have been published recently by the Department of Labor, show that the total value of the production amounted to $1,164,775,532, as against $718,352,603 for the year 1905. The figures for 1910 include the following items:—Boilers and engines, $11,873,903; bridges, iron and steel, $6,502,410; cement, $5,683,036; electrical apparatus, $15,021,840; electric light and power, $12,917,232; foundry and machine shop products, $45,611,410; gas lighting and heating, $4,005,836; iron and steel, $34,613,710; ships and ship repairs, $5,136,257; and smelting, $33,669,700.

ANNUAL REPORT, DEPARTMENT OF LABOR.

THE annual report of the Department of Labor notes an upward tendency in wages, attended by an increase in the cost of living. The success of the Industrial Disputes Act is indicated by the fact that in five years 124 disputes in which it was invoked have arisen, and only in 14 cases did the conciliatory proceedings fail to prevent a strike. Last year there were 97 industrial disputes as against 94 in the year previous. Building trades predominated in these difficulties. The report explains and reviews at length the work of the department, an important feature of which is the regular investigation and reports of wholesale prices in relation to the cost of living.

NICKEL PLANTS IN CANADA.

LARGE increases in existing nickel plants and the construction of new ones at Sudbury, Ont., are at present in progress as a direct result of the demand for nickel steel in war material following recent European unrest. Where, two or three years ago, the Canadian Copper Co., the greatest producer of nickel in the world, was carefully nursing the market for fear that the supply would be greater than the demand, it is now buying new ranges and enlarging its operations in an endeavor to supply its orders.

Although it has already large ore resources, the company has just bought part of the Northern range from the Lake Superior Power Co. It is also opening up the Froude mine and other old workings which have been allowed to lie idle for years. Its example is now being followed by other companies. The Mond Nickel Co., which has been shipping small quantities of nickel to England for some years past, is putting up a large and up-to-date smelter, and will carry on operations on a much larger scale. The Dominion Nickel Co. will build a new smelter at Cobalt. This company has for years held valuable properties such as the Whistle and Murray mines, but only lately has the market for the ore broadened enough to warrant it to enter into competition with such a formidable competitor as the International Nickel Co. M. J. O'Brien, Renfrew, Ont., and J. R. Booth, the Ottawa lumberman, are the principal stockholders in the new company.

Mr. Russell Medland, formerly manager of the Toronto branch of the General Supply Co. of Canada, Ltd., is now resident in Winnipeg, having charge of the company's Western business.

Point du Bois, Winnipeg, Hydro-Electric Power Station

Through the courtesy of Mr. J. F. I. Thomas Montreal, Canadian representative of Vickers, Ltd., Sheffield, England, we are enabled to publish this comprehensive descriptive article on the constructional and equipment features of the above installation, and believe that our readers will find it both interesting and instructive.

THE purpose of this article is to give a description of the new hydro-electric station which has been built to supply electric power to the city of Winnipeg. The station, the designs for which were put in hand in 1906, was completed in the latter part of 1911 and is now in operation. The supply system, of which the station forms a part, is a new one and will not be worked in conjunction with the earlier system of the city, but in competition therewith, since the new system is a municipal one, while the earlier is in the hands of a company.

The new station is situated at the Point du Bois Falls, on the Winnipeg River, some 70 miles from Winnipeg, so that the electrical scheme includes not only the power-station, but a 77-mile transmission line and a terminal station in the city, in addition to various sub-stations and the distribution network. The power-station machines generate current at 6,600 volts, which is stepped up to 72,000 volts for the transmission lines. At the terminal station, this pressure is stepped down to 12,000 volts for distribution to the sub-stations, at which it is further reduced to 2,200 volts and 550 volts. The 12,000-volt distribution to the sub-stations is carried out by underground cables, while the lower pressure distributing network is both overhead and underground.

Location Features.

The Winnipeg River, with its tributary the English River, has a watershed of some 52,000 square miles, situated in Northern Minnesota, North-West Ontario and Eastern Manitoba. The average rainfall in the area is from 18 in. to 25 in., and the river flow at the Point du Bois Falls was 16,000 cub. ft. per second as a minimum and 55,000 cub. ft. per second as a maximum during the years 1907 to 1910. Old flood-marks suggest that flows of 90,000 to 100,000 cub. ft. have been reached. On the whole, however, the flow is very uniform as compared with other Canadian rivers, this state of affairs being largely accounted for by the large amount of virgin forest land and the great number of lakes in the watershed. The total lake area is 5,650 square miles, the largest lake of the district—the Lake of the Woods—through which the river flows, having an area of 1,200 square miles.

There are no falls of great height on the river, the total fall, in a distance of 347 miles from the mouth at Lake Winnipeg, averaging about 2 ft. per mile. The natural fall at the Point du Bois was from 28 ft. to 33 ft., but on the construction of the power-house this fall was increased to from 43 ft. to 47 ft. by building dams and drowning out smaller falls up stream. The dams have resulted in the formation of a reservoir of 6,000 acres in extent, which gives such ample storage that there is no fear that the station will not be able to meet all demands for power during any season. It is estimated that the water supply will allow of the generation of an average of 65,000 horse-power for twenty-four hours at all times.

Power Station Site.

The site of the power-station, and the general plan of the works carried out at Point du Bois, are shown in Fig. 1. It will be seen that the river falls over two natural rock barriers in its passage round the Point du Bois, and that by building a rock dam and spillway across the narrowest part of the stream, the level of the water above the falls has been raised to form the reservoir. As before stated, the natural level has been raised sufficiently to drown out some smaller falls up stream. The building of the dam and spillway is the only interference that was necessary with the river-bed proper, as the supply to the power-station has been arranged for, by cutting a forebay canal on the western side of the river and across the base of the point.

As will be seen from the figure, the canal intersects an arm of the original river, and a spillway from the forebay

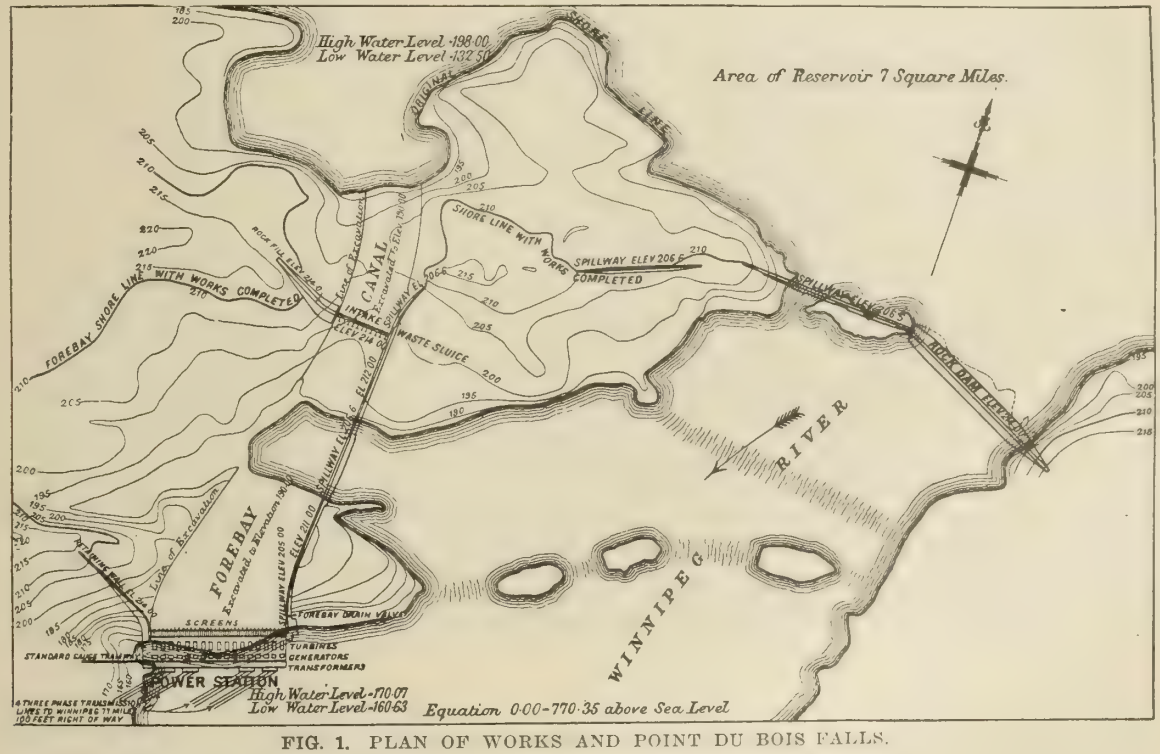

FIG. 1. PLAN OF WORKS AND POINT DU BOIS FALLS.

has been constructed, communicating with the downstream side of the rock dam. The eastern side of the forebay canal is in the main formed by a retaining wall. In addition to the two spillways already mentioned, there are two situated on the land originally dry, one running approximately east and west across stream, and the other being situated in the canal wall above the intake. The total length of these spillways, or weirs, is 1,500 ft. The crests of the weirs are 7 ft. 4½ in. below the normal water head of the reservoir. The whole of these spillways, together with the the canal retaining walls and the wing wall to the western side of the power-station, were built in concrete. A general view of the forebay canal and other work is given in Fig. 3.

The position of the power-station is shown in Fig. 1, while details of its construction are given in Figs. 4 and 5.

FIG. 2. VIEW OF SCREENS.

The building, which is constructed almost entirely of concrete and steel, has its foundations directly on the natural granite which forms the site. On its north side an upward sloping reinforced concrete apron has been built on a series of supporting walls. This apron, which is 18 in. thick, serves to control the direction of the water in its path into the station, and in addition acts as a gravity dam. The water screens are carried above this apron, as shown in Fig. 5. A view of these screens is also given in Fig. 2. The apron is tied to the wheel-pits on its south side, and these in turn are connected up to the tailrace walls. The wheel-pits, galleries and roofs of the building are made of reinforced concrete. The main walls are of plain concrete.

Station Arrangement.

The general arrangement of the station, and the passages through which the water reaches and leaves the turbines, will be clearly seen from Figs. 4 and 5. The water enters the wheel-pits through inlets, 16 ft. by 20 ft., which have rounded piers between them, and passes on its way through the screens, 45 ft. long and set in a slope as shown. The screens are made in 7-ft. bays, and are supported by sets of three struts, which are attached to a common foot-plate. This arrangement was adopted as offering the minimum of resistance to the flowing water. The head-gates are situated between the racks and the wheel-pits. They are made with a steel framework covered with pine sheathing. The turbine exhaust-passages are 10 ft. by 15 ft., of oval section at the point of intersection with the turbine-pit floor, and expand to 13 ft. by 23 ft. at the point of outlet. As the head under which the turbines work is of moderate height only, a very large amount of water has to be dealt with, and considerable attention was accordingly required in connection with the question of the velocity of the water in the various parts of the plant. The station will ultimately have a capacity of 60,000 horse-power; and under full-load conditions with such an output, the water would have a velocity of 6.4 ft. per second through the intake in the fore-bay canal. As the canal gradually widens towards the power section, the water would decrease in speed, and pass through the outer piers of the gate-room at 1.5 ft a second. It would then increase to 1.7 ft. a second through the screens, 2.8 ft. a second through the wheel-pit inlets, and 20 ft. a second through the turbine runners. It would then decrease to 8 ft. per second through the neck of the exhaust-passage, and to 3.3 ft. a second, as this passage gradually increases in area.

Plant Capacity and Equipment.

As stated above, the station is arranged to ultimately accommodate 60,000 horse-power, but at present less than half this capacity has been installed, and only half the station has been built, with the exception of the apron and other portions of the north face, which have been completed as shown in Fig. 4. In view of the moderate head and the very large amount of water which would have to be passed through each unit if a very large size had been chosen, it was decided to instal two-runner turbines of 5,200 horse-power coupled to 3,000 k.w. generators. These units, at 45 ft. head, each pass 1,250 cub. ft. of water per second at maximum output. They run at 164 revolutions per minute. With this output, the water velocities stated are reached. Although the load which the station is to take would have justified units of 60,000 k.w. output, which could have been arranged for by installing four-runner units, it was considered that the very large water passages necessary would be undesirable, and 3,000 k.w. units, were finally decided on. The electrical apparatus in the station is arranged so that three of the 3,000 k.w. units shall normally run together and act as a single unit of 9,000 k.w. The ultimate installation will consist of five of such 9,000-k.w. units and one spare generator, the present installation consisting only of five 3,000-k.w. machines. This feature of the station will be referred to again when dealing in detail with the turbines and electrical gear.

Machines Testing Arrangements.

An interesting feature in connection with the turbines is shown in Fig. 4. This has reference to the arrangements which have been made for testing the machines. It will be seen that, commencing from the right-hand side of Fig. 4, there are six wheel-pits, which make up the first two 9,000-kw. units, and that there is then a single wheel-pit next to the space which is filled by the exciter turbines. This single pit is used for the testing of any machine, and is arranged with a special cast-iron frame above the exhaust passage, on which a machine can be set and lined up. The test is carried out by measuring the water actually passing through the turbine, the power output being, of course, obtained from the electrical end of the set. The water is measured by means of a rectangular flume, which has been built as an extension to the tail-race of the wheel-pit in

FIG. 3. GENERAL VIEW OF FOREBAY CANAL AND POWER STATION.

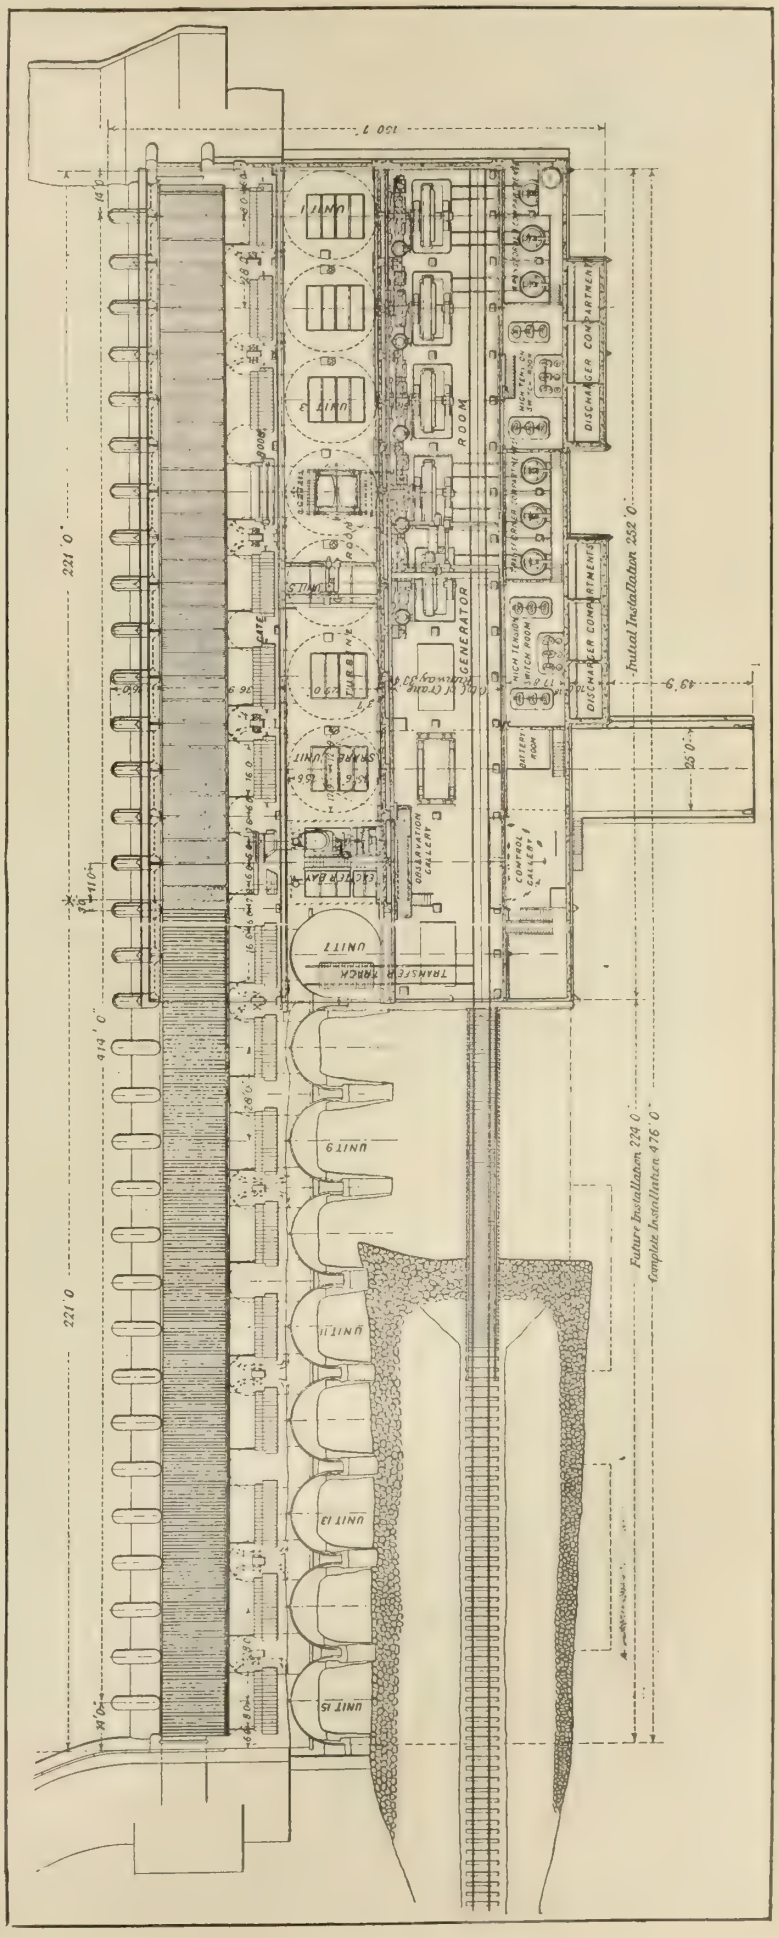

FIG. 4. PLAN OF POWER STATION.

question, and which can be clearly seen in Fig. 4.

The amount of water passing through the flume is calculated from the velocity, which is ascertained by observing the movements of a vertical close-fitting diaphragm which hangs from a raft floating in the flume, and is free to move with the current. The walls of the flume are built of concrete, and in them flush oak blocks are set, carrying electrical contacts. There are three pairs of contacts—the first close to the power-house, the second 4 ft. 6 in. away from these, the third 25 ft. 9 in. away from the second, and the contacts are arranged in connection with electrical gear which records the instant at which the diaphragm passes each pair of contacts.

When testing a machine, the raft is drawn up close to the power-house wall, and held there until the load on the machine is constant and everything ready for the test. During this time, the diaphragm takes up an inclined position, owing to the discharge water passing under it. At a set time, the raft is released, and the diaphragm, falling by its own weight, is at the same time carried forward by the stream of water. On its pasage forward it makes connection with the contacts, so that a measure of its outward velocity, and so of the velocity of the water, is secured. The diaphragm is provided with a pointer projecting above the raft, this pointer indicating when it is vertical, so that if it is still in an inclined position when it passes the first pair of contacts, the reading from them is ignored and the time-interval between the second and third pair of contacts only is considered. This testing appliance was installed to the designs of the firm which supplied the turbines, the Canadian Boving Co., Bay St., Toronto.

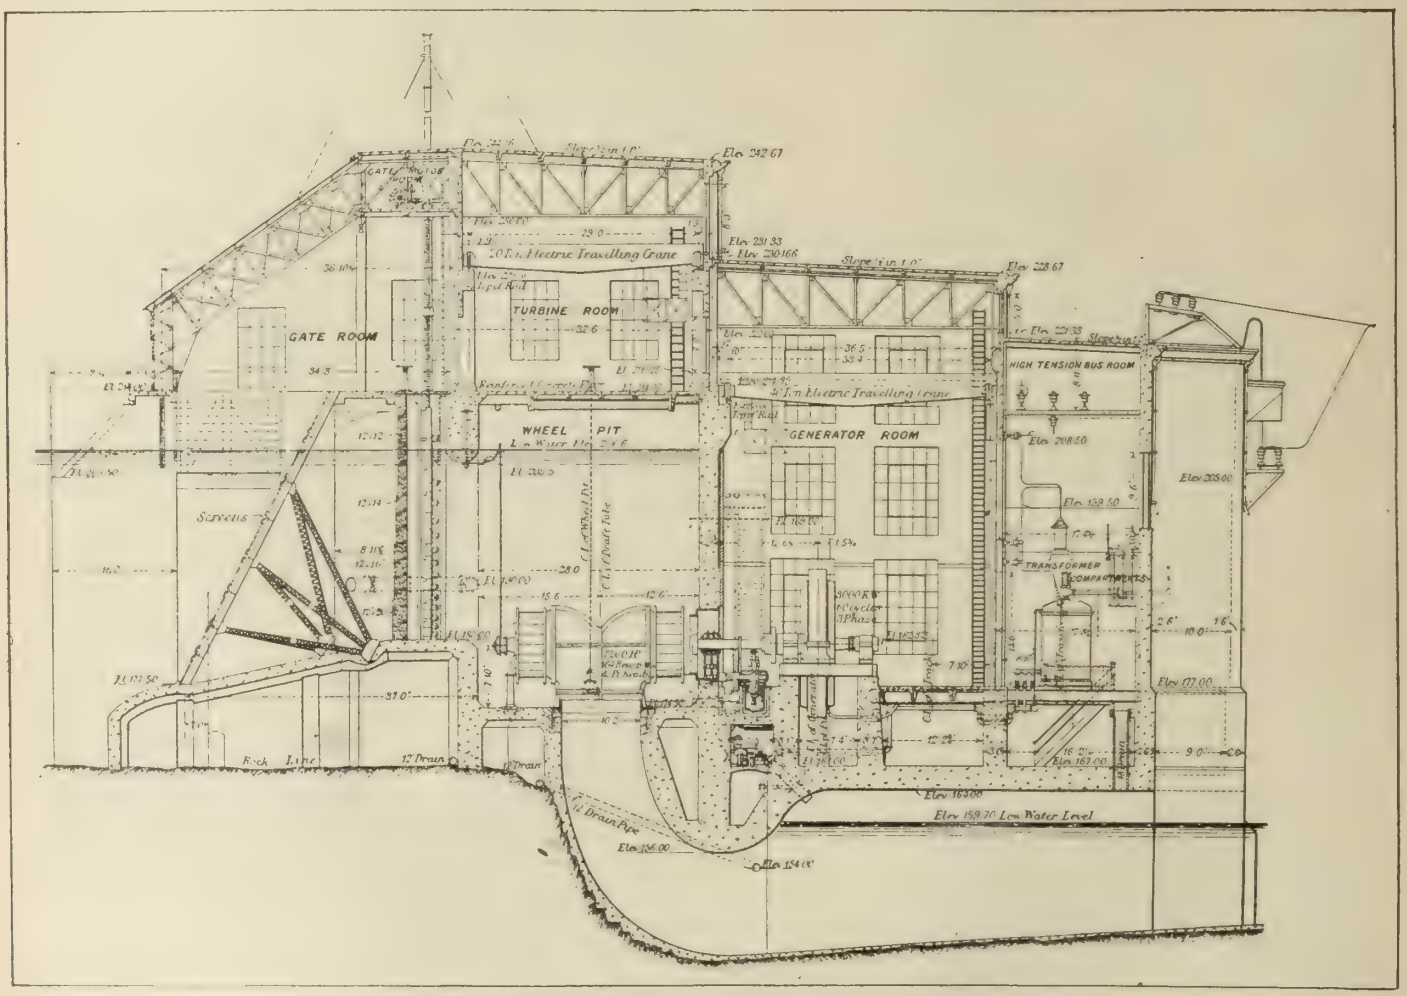

FIG. 5. CROSS SECTION THROUGH POWER STATION.

Arrangement of Equipment.

The general arrangement and the distribution of the plant in the power-station will be easily followed from Figs. 4 and 5. It will be seen that the building is divided longitudinally into four parts, containing respectively the water-screens, the turbines, the alternators, the transformer and switch-gear, and that annexes are built on the south side to hold the lighning-arrestors and outgoing-line connections. The head-gates between the screens and the wheel-pits work on rollers, and are lifted by means of vertical screws 40 ft. long, which rise through motor-driven nuts placed in the gate motor-room. The lifting motors drive horizontal shafts, and are arranged with clutches, so that one motor can lift any one of four gates. Stop-logs are arranged to be placed between the water-screens and the gates, if necessary, to serve as an alternative method of cutting off the water supply, or for use when it is desired to work in the gates. The turbine and generator-rooms are each fitted with traveling cranes as shown, while the distribution of the electrical gear will be clear from the figures.

Turbines Detail.

As stated in the previous part of this description, the station is equipped with 5,200 horse-power turbine units coupled to 3,000-kw. alternators, which generate three-phase current at 60 cycles and 6,600 volts. The turbines were supplied by the Canadian Boving Co., Bay street, Toronto, and the alternators by Messrs. Vickers, Ltd., of River Don Works, Sheffield. The turbines are of the two-runner type, and their general lines will be followed from Figs. 6 to 13. The main casings are of cast iron, and are carried by oval castings, which are

bolted above the concrete formation of the draught tube or exhaust passage. Additional support is attained at the outer ends by brackets resting on the concrete bottoms of the wheel-pits.

The machines have each three bearings, the inner being situated in the line of the wall separating the wheel-pits from the alternator-room, the outer being carried by the main casing and obtaining additional support from the bracket before mentioned, and the centre one being carried by the metal which forms the passages on the exhaust sides of the wheels. The whole arrangement is clearly shown in Fig. 6. The two outer bearings are lubricated with grease supplied by pumps driven from the turbine-shaft, while the inner bearing has ring lubrication, as shown. This inner bearing is ,of course, accessible from the alternator-room.

The wheels have cast-iron hubs with forged-steel plate buckets, and are keyed to the shaft, which is carried right through the machine, and has a coupling at the inner end, to which a short length of shafting is attached. This length of shaft is coupled to the alternator at its inner end. The wheel gates are of the shutter type, and are operated by means of two gate-shafts which run along either side of the turbine in the same horizontal plane as the main shaft. They are clearly shown in Fig. 7, and can be seen in Figs. 8, 10 and 11.

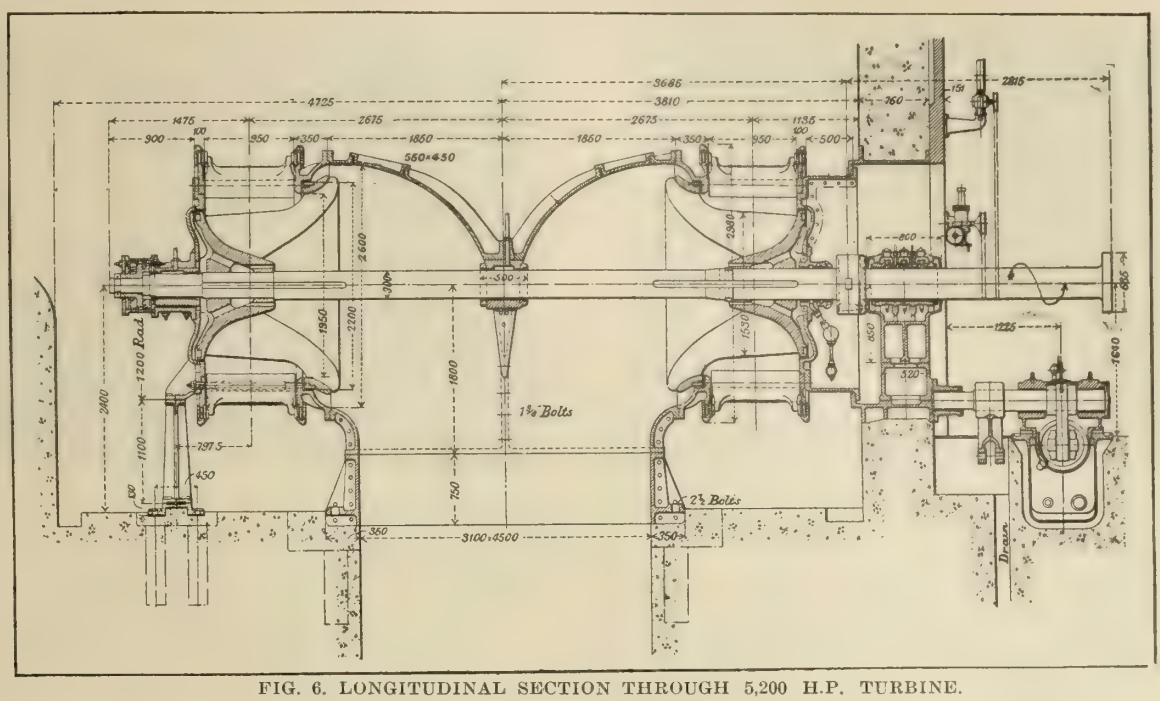

FIG. 6. LONGITUDINAL SECTION THROUGH 5,200 H.P. TURBINE.

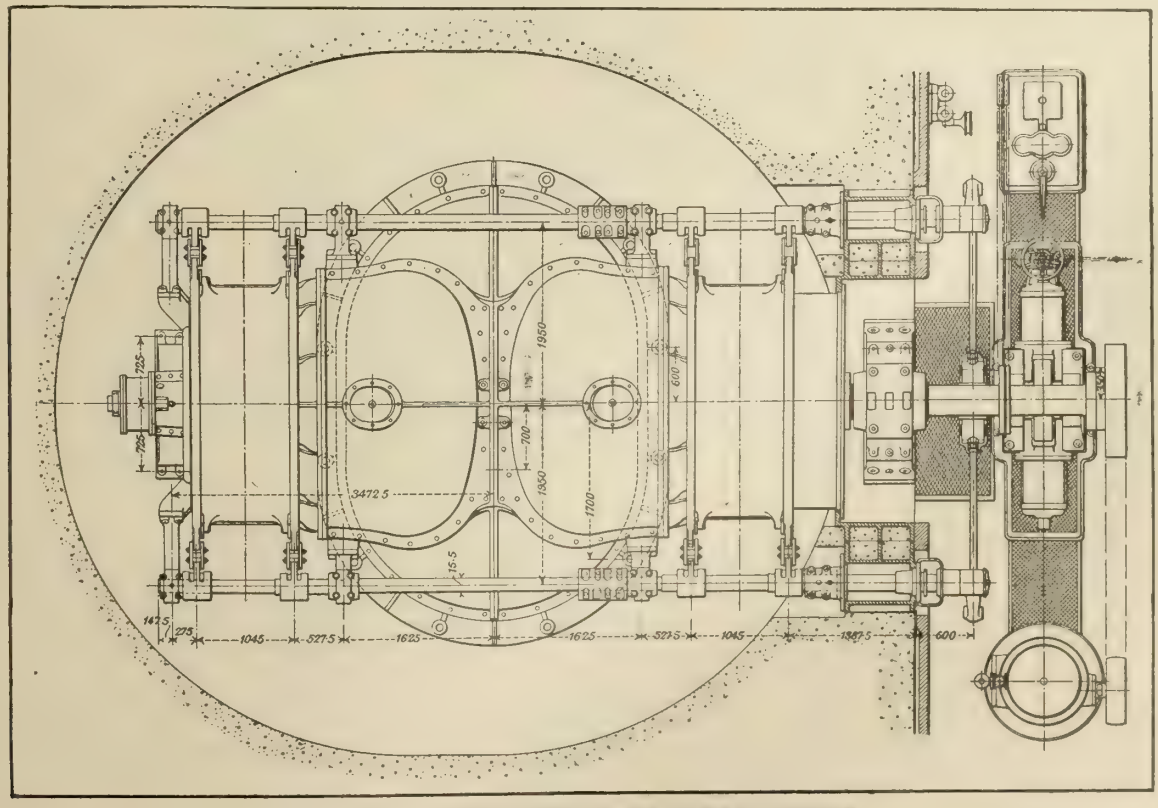

FIG. 7. PLAN OF 5,200 HORSE POWER TURBINE.

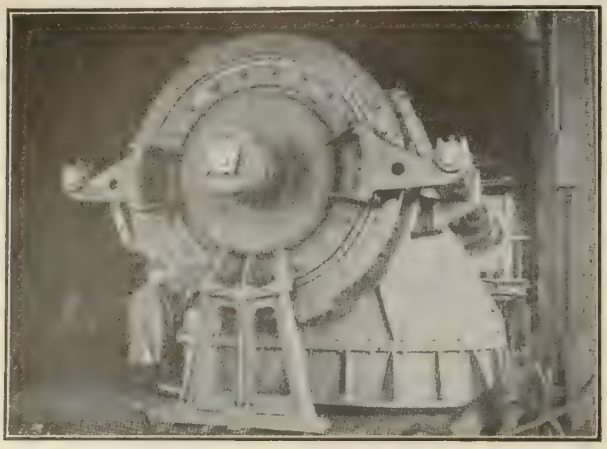
The arrangement of the gate-shutters can be followed from Figs. 6 to 9.

The operating shafts are connected up by links to rings which lie on the outside of the wheel casing, and which are in turn attached by short links to the shutters, as shown in Fig. 9. The rotation of the gate-shafts rotates the rings, so that the shutters can be opened or closed. The shafts are operated by means of the crank-and-link mechanism shown in Figs. 12 and 13, which is driven by a pair of oil-cylinders, acting in conjunction with the governor gear.

Governor and Gate Operating Gear.

The whole of the governor and gate-operating engine arrangements are situated in the alternator-room, as shown in Figs. 6 and 7. The operating engine is best seen in Fig. 12. It consists of two vis-a-vis cylinders, supplied with oil from a pump situated in the lower part of the oil reservoir, shown at the left-hand side of Figs. 12 and 13, and driven by means of a belt from the turbine shaft, as indicated by dotted lines in Fig. 12, and as shown in plan in Fig. 7. The oil-pump supplies oil to the cylinders through the intermediation of valves, which are controlled by the governor. These valves are shown at the right-hand side of Fig. 12. This figure also shows the connecting pipes between the oil-pump, the valves, and the cylinders.

The mechanism operates by means of a balanced valve, which is connected up



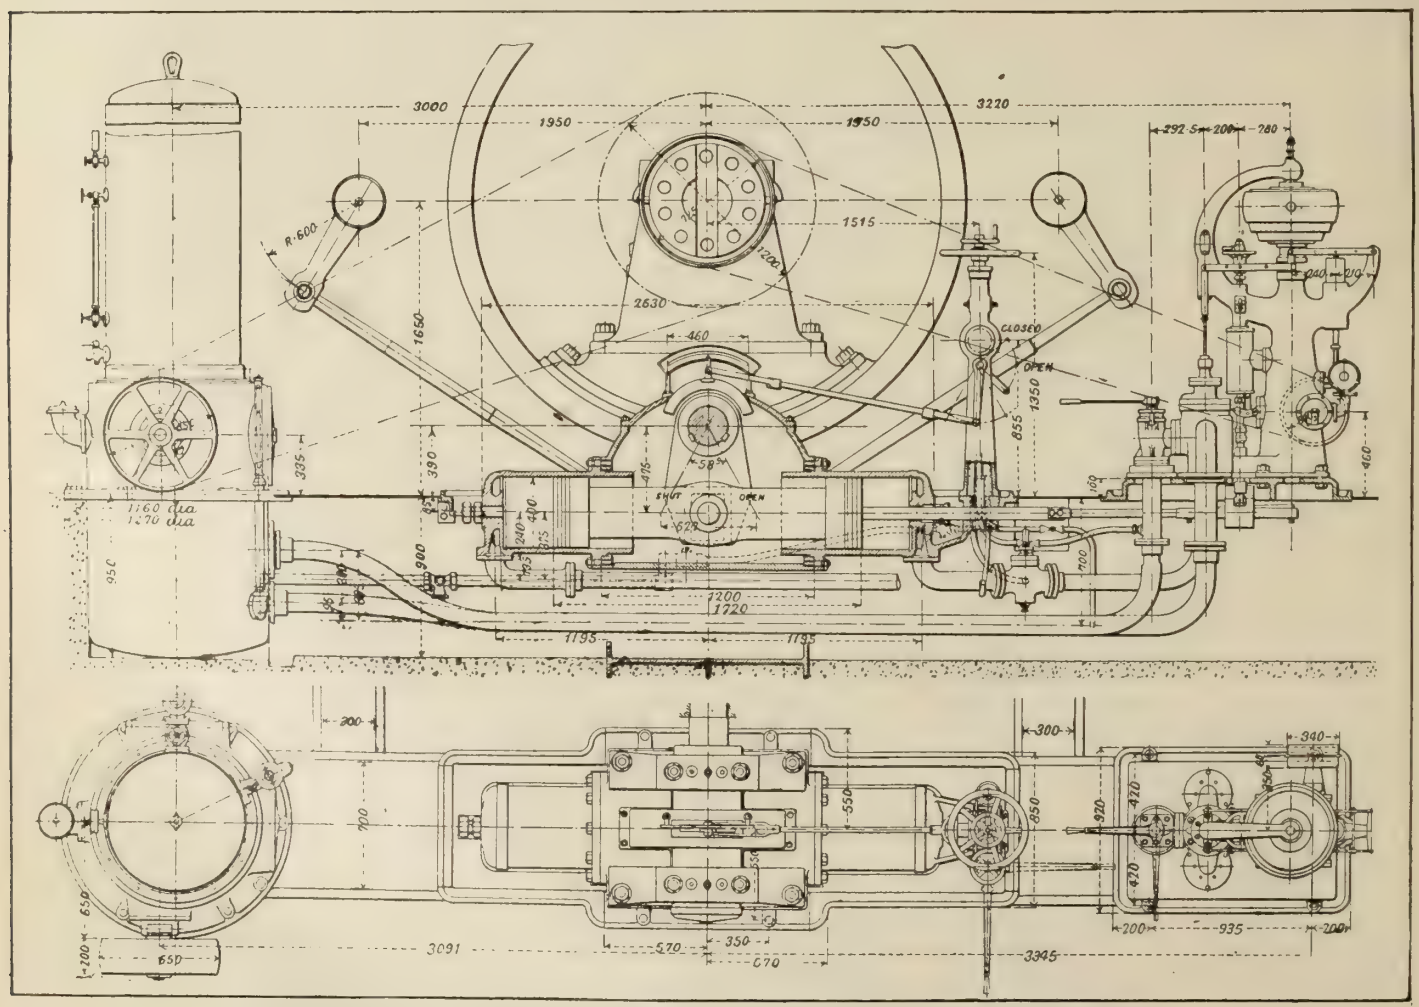


FIG. 8. VIEW OF TURBINE FROM OUTER BEARING END.

FIG. 10. VIEW OF TURBINE FROM ALTERNATOR END.

FIGS. 12 AND 13. VIEWS OF GOVERNOR GEAR AND GATE-OPERATING ENGINE.

to the lever mechanism of the governor, as shown in Fig. 12, the governor being driven by two belts from the main shaft, which are indicated in the same figure. The position of the balanced valve, which depends on the speed of the governor, is such that, when running at normal speed, the oil pressure is equally maintained on each of the vis-a-vis cylinders, so that the wheel-gates are held in a fixed position. Increase or decrease of speed, however, puts one or other of the cylinders to exhaust, so that the pistons move respectively in or out, and the gates are adjusted to suit the new conditions. There is an electrical attachment on the governor controlled from the switch-gallery, which can be used to operate the balanced valve when necessary and particularly during synchronizing. A by-pass arrangement is fitted in connection with the hand-wheel pillar shown, for use when starting up.

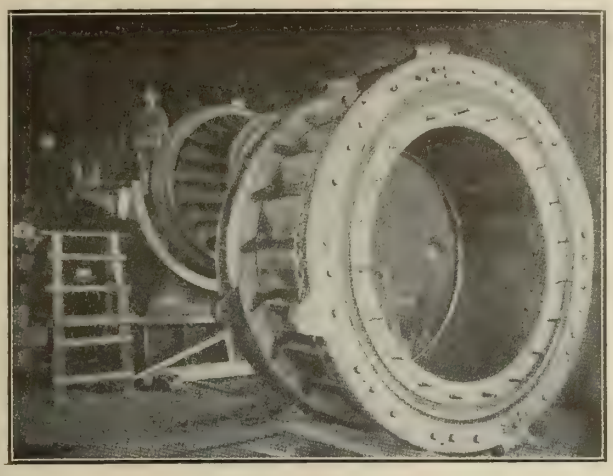

FIG. 9. VIEW OF WHEEL CASING SHOWING SHUTTERS.

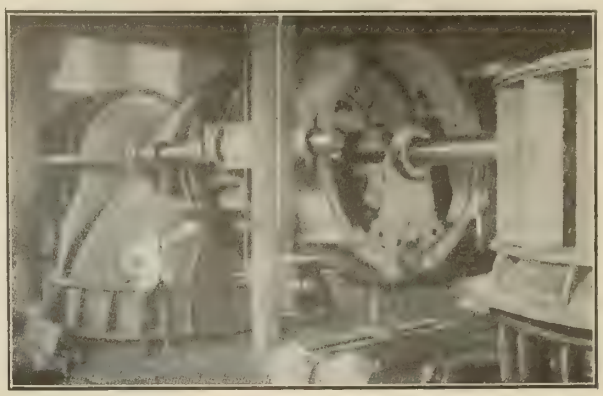

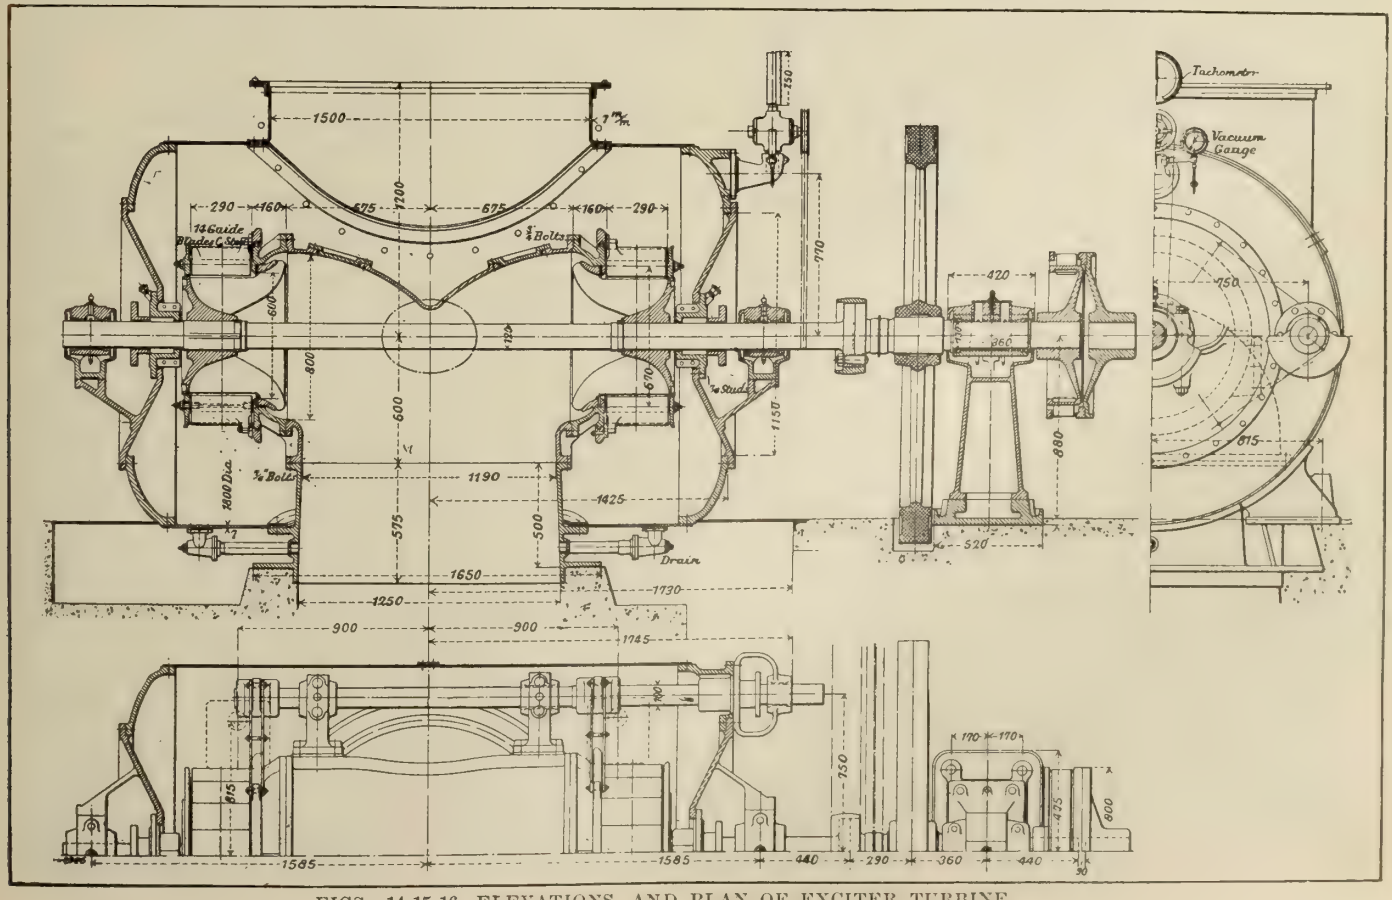

FIG. 11. VIEW OF TURBINE FROM ALTERNATOR END.

The low-pressure and high-pressure oil-reservoirs of the governors of the various units are interconnected by means of a system of pipes, and in an emergency any, or any two of the pumps may be stopped, the corresponding gate-operating engine or engines, being then supplied with oil from the pumps of the other sets. All the pumps are of sufficient capacity to allow of this arrangement. A view of one of the main governors is given in Fig. 17. The turbines have a guaranteed efficiency of 84 per cent. at full load, and run at 164 revolutions per minute. The governor gear is such that when 20 per cent. load is suddenly thrown off or added, the maximum momentary speed variation is 2.5 per cent., and when 100 per cent. load is thrown off or added, the variation is 15 per cent.

Exciter Units.

There are at present two exciters fitted in the station, each of 250 kw. capacity and driven by water-turbines, running at 500 revolutions per minute, also supplied by the Canadian Boving Co.

FIGS. 14-15-16—ELEVATIONS AND PLAN OF EXCITER TURBINE.

The position of these exciters can be well seen in the plan of the station which was referred to in the earlier part of this description and will be found in Fig. 4, while views of the exciter turbines are given in Figs. 14 to 16, and a general view in Fig. 19. As will be seen from these figures, the turbines are not set in wheel-pits as are the larger machines, but they have been provided with outer casings, on to which supply-pipes are fitted. The turbines are situated in a special bay, built between two of the main wheel-pits, and the supply-pipes are carried through the wall into the gate-room.

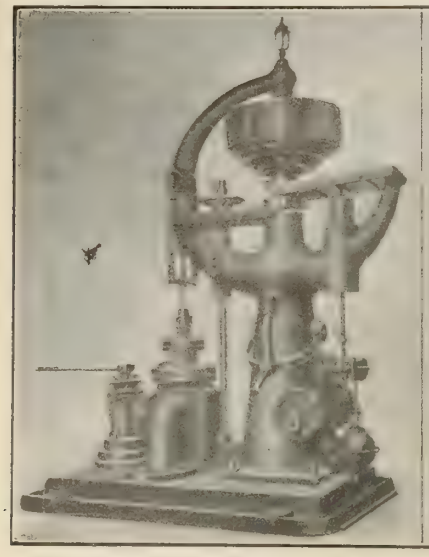

FIG. 17. MAIN GOVERNOR.

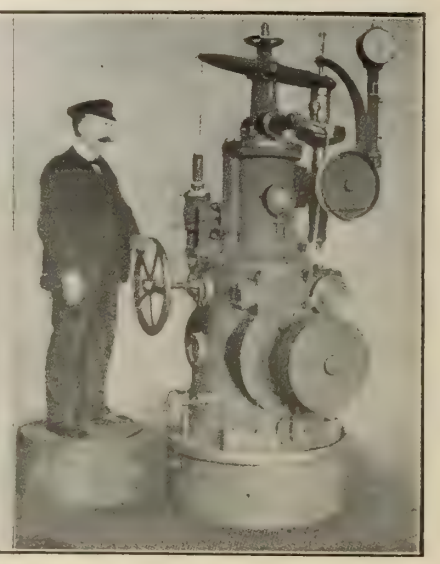

FIG. 18. EXCITER GOVERNOR.

Shut-off valves are fitted on these pipes, as shown in Fig. 19. The turbines themselves are substantially the same as the larger units, but have two bearings only, as shown in Fig. 14. Speed control is obtained by shutter gates, exactly as in the larger machine, and the gates are operated by oil-cylinders controlled by the governor, as before. One of the exciter governors is shown in Fig. 18. As will be seen in Fig. 14, and in some of the other figures, fly-wheels have been adopted on these small turbines, owing to the insufficient fly-wheel effect of the exciter armatures to which they are coupled.

Alternator Features.

The alternators, as before stated, were supplied by Messrs. Vickers, Limited, of River Don Works, Sheffield. They are of the firm's standard horizontal-shaft rotating-field type, and have each an output of 3,000 kw., or 3,750 k.v.a., at 0.8 power-factor. They give 6,600 volts and 60 cycles at 164 revolutions per minute. The specification for the alternators called for a

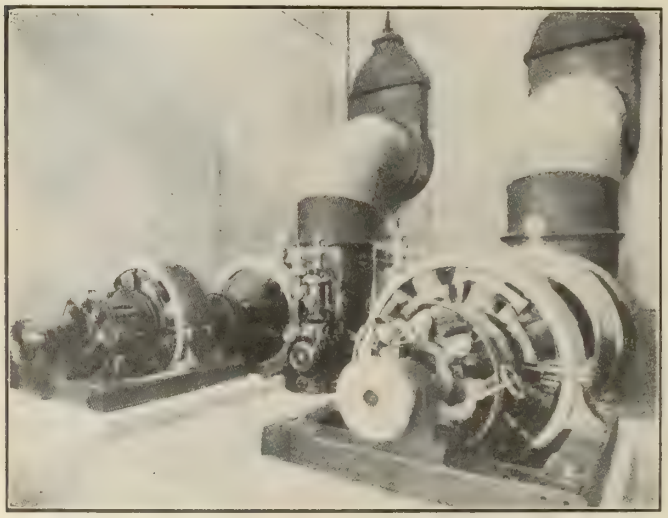

FIG. 19. VIEW OF EXCITERS.

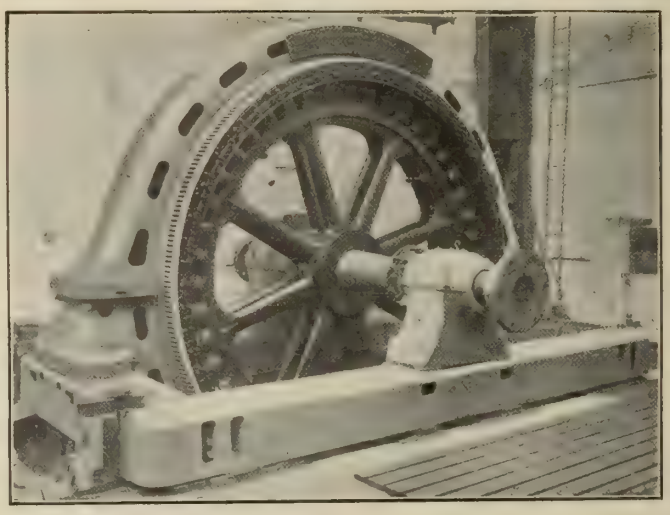

FIG. 20. VIEW OF 3,000 K.W. ALTERNATOR IN BUILDERS' WORKS.

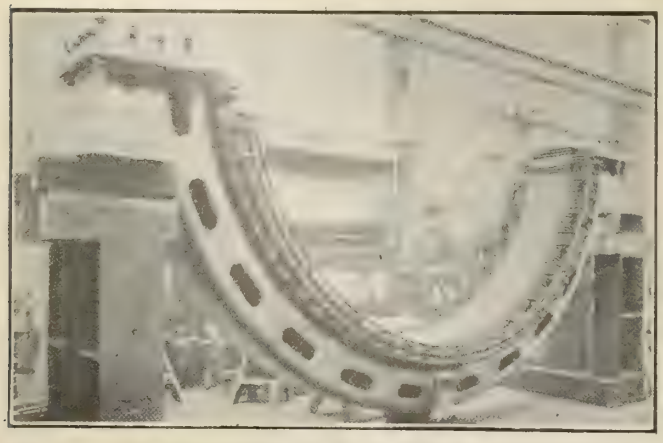

FIG. 21. VIEW OF LOWER HALF OF STATOR OF 3,000 K.W. GENERATOR.

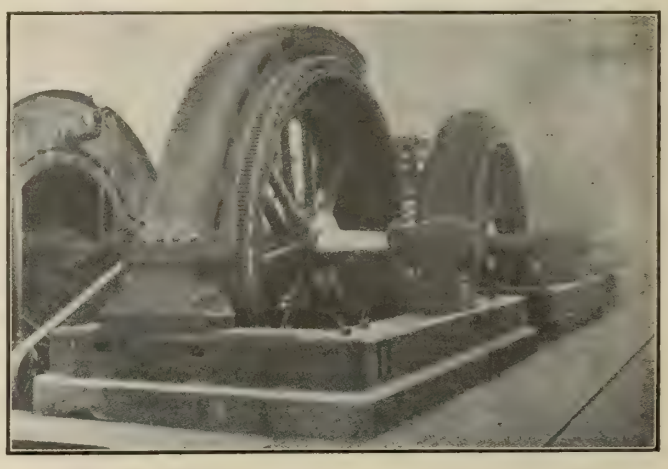

FIG. 23. GENERAL VIEW OF ALTERNATOR ROOM.

temperature rise of not more than 63 deg. Fahr. after 24 hours' full-load run, and not more than 99 deg. Fahr. rise after a 10 hours' run at 3,450 kw. (7,600 volts), and also not more than 81 deg. Fahr, rise after two hours at 3,750 k.w. following the 24 hours' test. All these conditions were easily met by the machines, and as it was found that at full gate the turbines could drive the alternators at greater output than had been specified, a test was made at 4,220 kw., under the conditions of which the temperatures did not exceed the maxima allowed.

The tests also included a runaway speed test for 15 minutes at 70 per cent. over-speed, the field being fully excited. Under these conditions the machine was short-circuited without any signs of injury. The regulation of the machine on test was 8.5 per cent. at unity power-factor, and 22 per cent. at 0.8 power-factor.

Fig. 20 shows one of the machines erected in the builders' works, while Fig. 21 shows the lower half of one of the stators. Figs. 22 and 23 are views taken after the erection of the machines in the power-station. It will be noted from the engravings that the stator frames have been made each in quarters for ease in transport. The figures also show the arrangements which have been made to allow the stator to be racked over for the inspection of the windings or for repair. The stator windings consist of former-wound coils insulated with moulded mica, and secured in their slots by hard-wood wedges. The projecting ends are anchored by mica-insulated bolts and distance pieces, the outer ends of the bolts being fixed to a complete ring which forms part of the guard covering the high-tension winding. The rotors are built up each of two cast-steel wheels pressed on to the shaft and carrying 44 laminated poles, keyed and dovetailed in position. Each pole is wound with bare copper strip on edge, with waterproof insulation between the turns, while bronze wedges are placed between the windings to prevent lateral displacement. Lubrication is by means of oil rings.

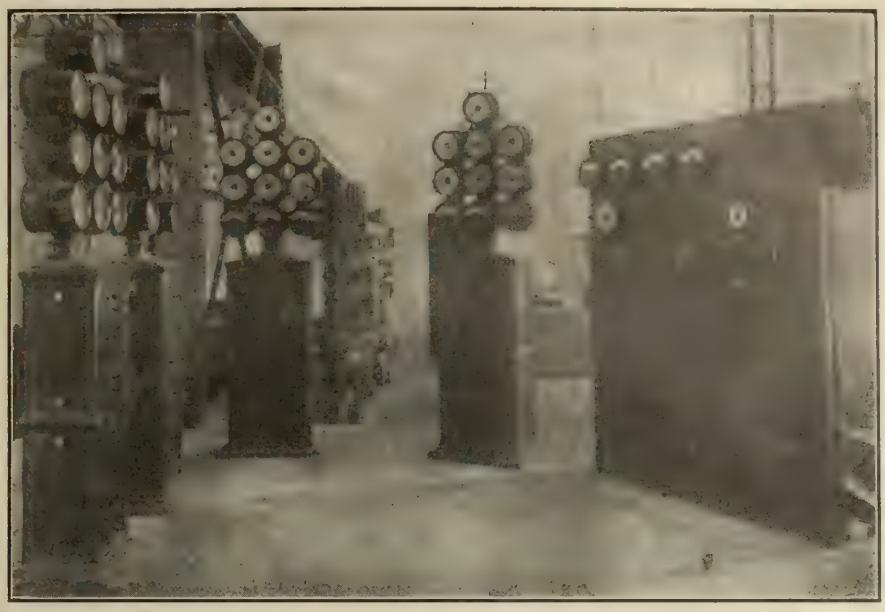

FIG. 24. SWITCH CONTROL PEDESTALS.

The exciters, which are two in number, were also supplied by Messrs. Vickers. They are of the firm's standard eight-pole shunt type, of 250 kw. capacity, and run at 400 revolutions per minute, giving 125 volts. They are illustrated in Fig. 19, and, as this figure shows, are driven by special water-turbines, as before mentioned. The voltage control of the alternators is looked after by Tirrill regulators, which act on the field of the exciters, and are set to compensate for line drop. On the completion of the station, two further exciters of similar capacity with those described above will be installed, but of a motor-driven type. The tests of the alternators and exciters were supervised by Messrs. Kennedy and Jenkins before despatch of the machines from England.

Operating Features.

As already mentioned it is intended that the 3,000-k.w. generators shall ultimately be operated three together, in the

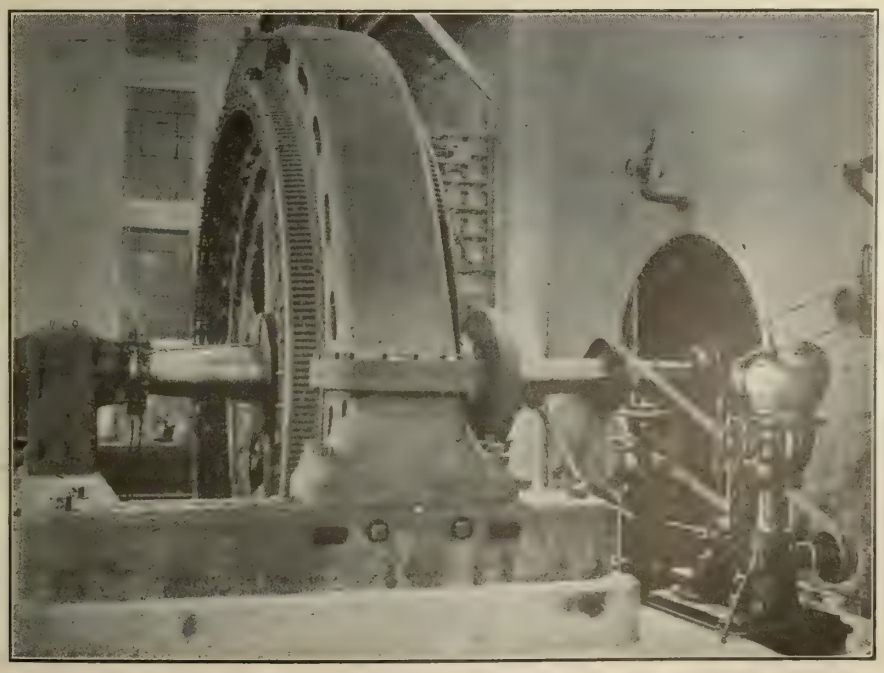

FIG. 22. VIEW OF 3,000 K.W. ALTERNATOR, SHOWING TURBINE GOVERNOR GEAR.

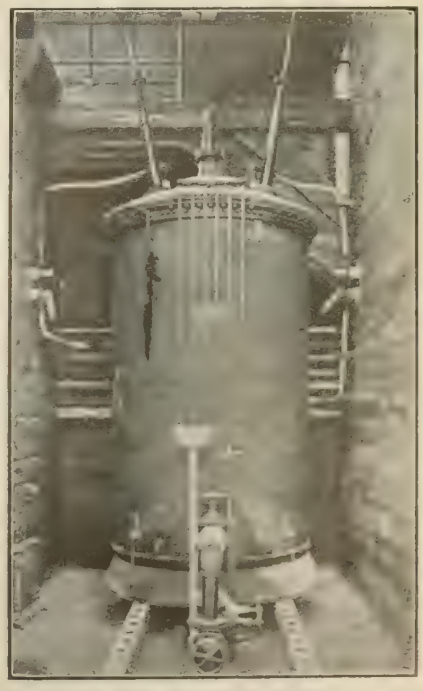

FIG. 27. 3,000 K.W. OIL-IMMERSED WATER COOLED MAIN TRANSFORMER

form of 9,000-kw. units. The ultimate lay-out of the station as will be seen from Fig. 4, allows for sixteen generators, so that there will be five 9,000-kw. units and one spare generator. At the present time, the whole of the apparatus is fitted for two 9,000-kw. units, with the exception that only five machines are installed. The banks of three machines are

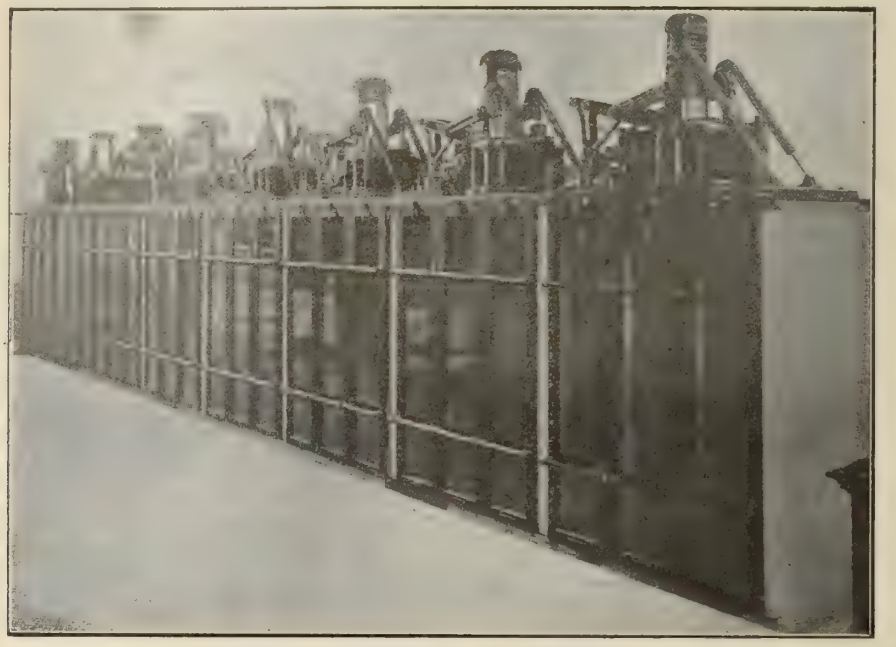

FIG. 25. 6,600 VOLT MAIN SWITCHES.

arranged to work in conjunction with banks of three transformers, each transformer being of the single-phase type and of 3,000-kw. capacity, the three being connected in delta. The transformers are of the oil-immersed water-cooled type, and are situated in independent concrete compartments which are shut off from the alternator-room by iron doors. The arrangement is clearly shown in Fig. 4. A view of one of the transformers is also given in Fig. 27. The transformer casings are of boiler-plate set on cast-iron bases, and the water-cooling coils are of brass.

Transformer Oil Treatment.

A very complete system for the treatment of the transformer oil is fitted in the station. It consists of filters, a dehydrator, pumps, tanks, and the necessary piping. The oil is received at the station in iron drums, and is at first allowed to flow into the "good" oil tanks by gravity. From thence it is lifted by a pump into a 1,500-gallon supply tank, from which the transformers are filled. "Bad" oil from the transformers is allowed to flow into the "bad" oil tanks by gravity. From these tanks the oil is pumped through a centrifugal-type separator and afterwards through the dehydrator, from whence it enters the "good" oil tanks, to be ultimately pumped into the supply tank. If, however, the oil after reaching the "good" oil tanks is found still to contain too much moisture, it can be passed again, or as often as desired, through the dehydrator before being lifted to the supply tank.

The transformers have an efficiency of 98.7 per cent. at full load, and a regulation of 4 per cent. at 0.8 power factor, and 1.1 per cent. at unity power factor. The temperature rise at full load is 35 deg. Cent. above that of the entering cooling water. The transformers are wound for 6,600 volts on the primary side, and will normally step up on a 1 to 10 ratio; tappings are, however, provided which permit a range of secondary voltage of from 53,000 to 72,000.

Switching Arrangements.

The switching arrangements consist of 6,600-volt oil-switches for both the alternators and transformers, and 72,000,-volt oil switches for the secondary slides of the transformers for the out-going lines and for bus-car coupling. The switches are placed in compartments formed between the banks of transformers, the 6,600-volt gear being on the alternator-room floor level, and the 72,-000 volt gear above. The 6,600-volt bus-bars are in duplicate, and run along the ceiling above the oil-switches. They are of copper strip, and are separated from each other by concrete barriers. The 72,000-volt bus-bars are of $\frac{5}{8}$ in. copper tube, and are carried in a special bus-bar room in the upper part of the transformer compartment of the power station. There are no barriers between these bars; the minimum distance from phase to phase is 4 ft., and the minimum distance from phase to earth 2 ft.

The gear contains the various necessary isolating switches and instrument transformers, and leads are run in connection with isolating switches on the 6,600-volt side in such a way that a transformer in one 9,000-kw. unit can, if necessary, be connected in another. The general lay-out of these switch-gear and transformer arrangements can be seen in Figs. 4 and 5. Views of the 6,-600-volt oil-switches and the 72,000-volt oil-switches are given in Figs. 25 and 26 respectively.

The connections from the outgoing feeder switches to the overhead lines are carried through special compartments, which are built out as annexes to the station, as shown in Figs. 4 and 5. The three compartments for one three-phase circuit occupy a length of the

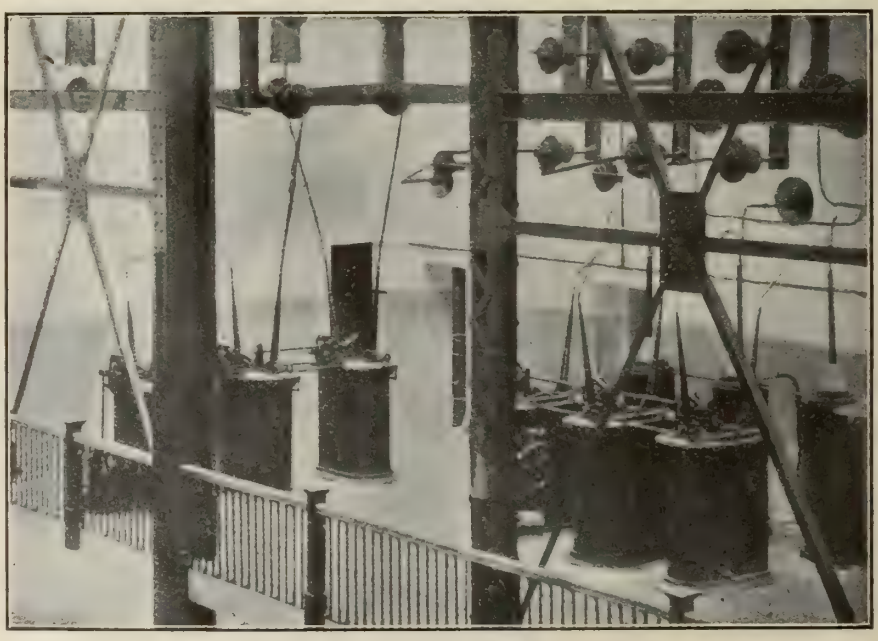

FIG. 26. 72,000 VOLT MAIN SWITCHES.

building which covers two tail-races. This length is actually 56 ft., being somewhat liberal for the apparatus which has to be housed; but the arrangement adopted gives a simple and convenient lay-out. Each compartment is fitted with an electrolytic lightning arrester and horn-gap for its corresponding overhead connection, while, in addition, there is a set of horn-gaps on the roof alongside the wire anchorages. The high-tension wires enter the compartments through reinforced-concrete hoods

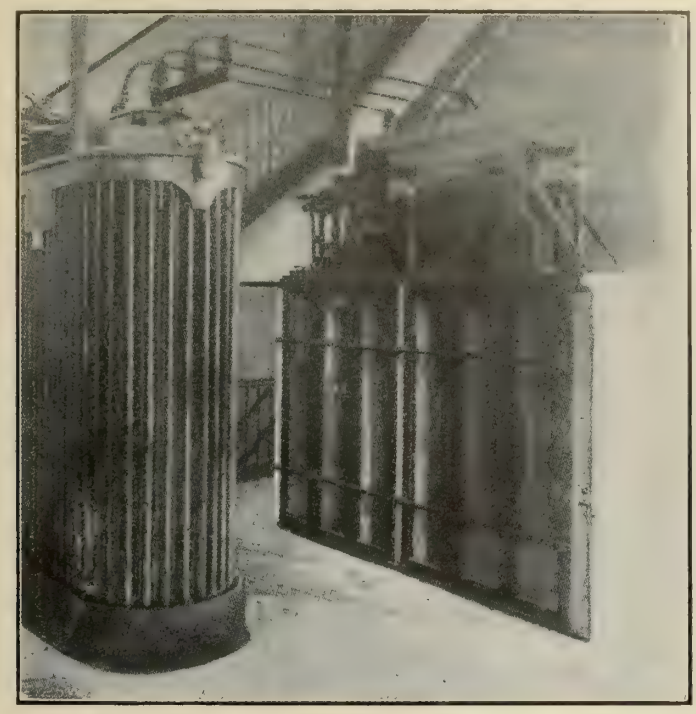

FIG. 28. 300 K.W. OIL-IMMERSED AUXILIARY TRANSFORMER.

which are suspended from the outer walls, as shown in Fig. 5. These hoods are open at the bottom, and on the side next to the building have special insulators, through which the wires enter the compartments.

Switch Gear Control.

The whole control of the switch-gear is looked after from a control gallery, which occupies what will be a central position in the completed station. This gallery contains the various indicating and recording instruments used, together with the small control-handles of the oil-switches, which are all electrically operated. The machine rheostats are also electrically controlled from this gallery. The instruments and control-handles for the main units are arranged on pedestals, as shown in Fig. 24, in order that confusion between the various sets will be less likely. The control-gallery also contains an exciter-board and gear for the operation of a 120-ampere-hour, 65-cell battery, which is used as a stand-by for lighting or for exciter or auxiliary service. There is also control apparatus for a 300-kw. 6,600 to 250 or 125-volt transformer, which is used mainly for lighting. This transformer is shown in Fig. 28.

In addition to the firms already mentioned in connection with the turbines and alternators, it should be mentioned that the whole of the transformers and switch apparatus were supplied by the Canadian Westinghouse Co., of Hamilton, Ontario. The consulting engineers for the station were Messrs. Smith, Kerry and Chace, while the whole scheme was in the hands of an advisory board appointed by the Winnipeg Corporation, and consisting of Professor Herdt, of McGill University; William Kennedy, Jr., of Montreal; and Colonel Ruttan, of Winnipeg.

A paper read by Mr. W. G. Chace before the Canadian Society of Civil Engineers together with data, photos and drawings supplied by Messrs. Vickers, Ltd., and the Canadian Boving Co., have we understand, contributed to the general completeness of this article, first published by "Engineering" of London, England.

WORLD'S INTERNATIONAL TRADE.

For the year 1912, the world's international business will reach the enormous total of $35,000,000,000, according to a report issued recently by the Bureau of Foreign and Domestic Commerce, Washington, D.C. The estimate is made on official returns of exports and imports from virtually every commercial country in the world. Nearly every nation reported a greater exchange of commodities than ever before had been known.

The new figure will establish a record, for it is four billion dollars greater than the trade in 1910 and more than double that done in 1890, twenty-two years ago. Seventy leading countries furnished their figures to the government statisticians. Only Argentina and Russia reported decreases, both falling off sharply. The United States so far has shown a monthly increase of $18,000,000 over 1911. Canada, Hayti, Honduras and Santo Domingo do most of their shopping in the United States, according to the report, while China, India, certain of the Balkan States and Turkey look elsewhere for their purchases. The balance of trade (that difference of goods sold over those imported) still remains strongly with American manufacturers and producers, the figures showing that they enjoyed a balance on the right side of the ledger of approximately $16,000,000.

HYDRO-ELECTRIC CO. NEW RATE SCHEDULE.

THE following is the new rate schedule in force to municipalities using power from the Niagara system of the Hydro-Electric Power Commission:

Municipalities.	Old rate.	New rate.
Toronto	$18.50	$15.00
London	28.00	24.00
Guelph	25.00	22.00
Stratford	32.00	30.00
Seaforth	41.00	40.00
Mitchell	38.00	37.00
St. Thomas	32.00	29.00
Woodstock	26.00	23.00
Ingersoll	28.00	25.50
Beachville	38.89	31.00
Tillsonburg	32.00	32.00
Norwich	30.00	32.00
Berlin	25.00	22.50
Waterloo	26.00	23.50
New Hamburg	32.00	32.00
Baden	37.00	37.00
Preston	25.00	21.50
Galt	25.00	22.00
Hespeler	26.00	23.00
St. Mary's	38.00	29.50
Dundas	17.33	16.00
Hamilton	17.90	16.00
Waterdown	37.50	26.60
Port Credit	36.70	31.00
Weston	30.00	30.00
Brampton	29.00	25.00
Mimico	30.74	30.00

The Main Belting Co. of Canada, Ltd., are moving from their present quarters at 25 Common Street, Montreal, to 10 St. Peter Street. The new warehouse has four stories in which a full line of all stock sizes of Leviathan belting up to 38 inches will be kept. On account of the large increase of business, a move to larger and more commodious quarters was found necessary.

John Carr, Pattern Maker, Hamilton, recently added a metal pattern department to his shop, and further extensions are planned for the near future. Mr Carr reports a large order from the Dominion Wheel & Foundries Co., Toronto.

INDUSTRIAL DEVELOPMENT

THE BROWN BOGGS CO., LTD., HAMILTON, ONT.

AMONG the many firms whom an increasing volume of business has compelled to extend their premises must be included the Brown, Boggs Co., who have of late greatly widened their field of operation. Always known as leading manufacturers of sheet metal working machinery of the highest class, they have lately gone in for heavier lines, such as heavy power presses and shears for similar work. They have also extended their line of canning machinery and are now employing a staff of draftsmen on plans for the complete outfitting of the most modern canning plants, including the architectural work, power plant, mechanical equipment, etc.

The Brown, Boggs Co., Ltd., are also manufacturing under patent rights a large amount of special canning machinery, hitherto only procurable in the United States. They are also sole Canadian agents for some fourteen United States manufacturers of canning machinery and supplies.

The present works at the corner of King William St. and Victoria Avenue are now entirely inadequate to the company's growing needs, and a thoroughly modern factory is under erection. This is situated on a fine site of 8 acres, on the west side of Sherman Ave., immediately north of G.T.R. tracks, to which it has a frontage of 935 feet. The site is also served by the C.P.R. and the T.H. & B. R.

The first unit, now rapidly approaching completion, consists of a pattern shop and storage, and a modern foundry. The pattern shop is an up-to-date 3-storey building with a reinforced concrete frame filled in with brick curtain walls. The ground and second floors will be used for pattern storage purposes, patternmakers being accommodated on the top floor. Large window areas, fitted with steel sashes, provide ample natural light, and a very complete equipment of band saws, jointers and other necessary wood-working machinery will be installed.

The foundry is a steel frame building of thoroughly up-to-date design and will have electric traveling cranes, air-operated moulding machines, sand blast apparatus and other modern appliances. This foundry will give the company about four times their present output.

Later, it is proposed to enlarge the new plant by the addition of a machine shop, blacksmith shop, warehouse, offices and power house; and when these are completed the company's present works, covering an area of about 1½ acres, will be disposed of.

FORD-SMITH MACHINE CO., HAMILTON, ONT.

PROMINENT among the smaller firms of machine builders are the Ford-Smith Machine Co., Hamilton, Ont., who are earning an excellent name for the work they turn out. Their grinders in particular are meeting with much favor, and the firm are now making as broad a line of floor and water tool grinders as any of the concerns in the United States.

The Ford-Smith Co. have, of late, paid a great deal of attention to the standardising of steel safety collars for abrasive wheels, and have finally adopted a standard which they believe meets every requirement. The firm is at present engaged in standardising a line of protective guards and dust exhausts for grinding wheels.

THE GOLDIE & McCULLOCH CO., LTD.

GOLDIE & McCULLOCH Co., Galt. Ont., report a good year's business for 1912. During the summer they made a large addition to their boiler shop which is situated in the north quarter of the city, about a mile from the main works. The original shop covered an area of 320 by 120 feet, and the new addition measures 160 by 120 feet, or an increase of 50 per cent. The company have now one of the finest and best equipped boiler shops in Canada, and one which should meet all requirements for some time to come.

The building has a steel frame and brick walls, and consists of a centre 60-ft. bay and two side bays of 30 feet. Large window areas are provided and the monitor over the centre bay has a skylight extending its full length. The floor is of wood blocks laid on edge, and the roof is of 2-inch matched boarding covered with an approved roofing material. The centre bay was originally served by a 25-ton electric traveler by the Morgan Engineering Co., Alliance, Ohio., and

BOILER SHOP OF THE GOLDIE & McCULLOCH CO., LTD., GALT, ONT.

Since moving into their new factory at the corner of Princess and Earl Sts., Hamilton, at the end of 1911, the output of the firm has nearly doubled; in fact the new premises are already inadequate and considerable extensions are planned for 1913.

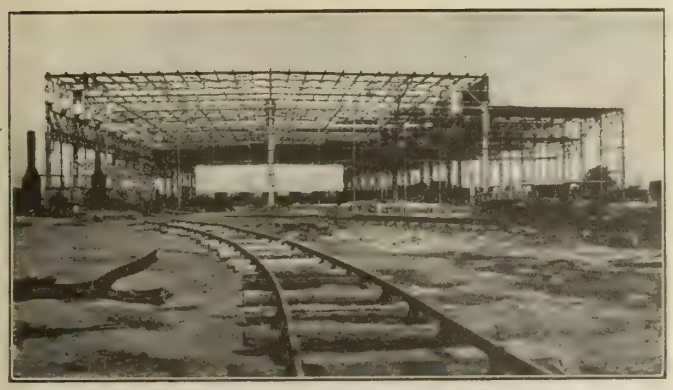
when the shop was enlarged, a 5-ton traveler of the same make was added. The stationary hydraulic riveter exerts a pressure of 150 tons, has a gap of 10

ft. 6 in., and is served by a 15-ton tower crane. Further hydraulic equipment includes a 750-ton flanging press. This is served by a 10 ft. x 12 ft. Rockwell oil fired flanging furnace, and there are two other plate furnaces, also oil fired. Among other equipment installed this year is a very fine 4-spindle flue sheet drill.

A feature of the shop is the excellent artificial lighting. This is by means of flaming arc lights, so placed as to practically eliminate all shadow. We have seldom seen a better lighted boiler shop. An exterior view of the building appears on the previous page.

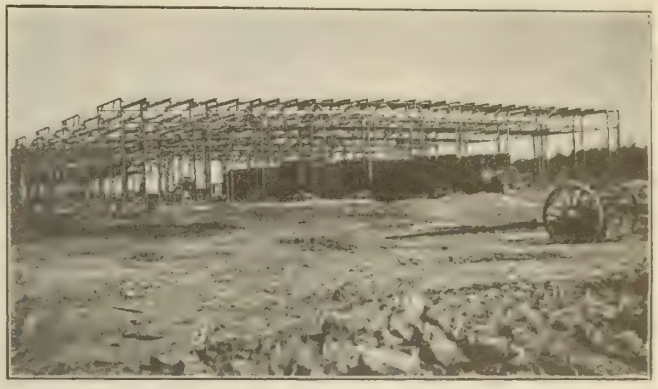
NATIONAL STEEL CAR CO., LTD.

THE plant of the National Steel Car Co. at Hamilton, Ont., is rapidly nearing completion, and will soon be in a position to turn out thirty steel freight cars each working day.



The company was incorporated in July, 1912, under a Dominion charter and has its head offices in the Transportation Building, Montreal. The authorized capital stock is $6,000,000, divided in $3,000,000 of 7 per cent. cumulative preference stock and the same amount of common stock. The paid-up capital is $3,500,000.

The works are situated on a site of fifty-five acres at the east end of the city on the shores of the bay, and it is the company's intention at some future date to build a dock and dredge the bay to enable them to handle raw stock by boat as well as by rail. The plant has been under construction since the latter part of July, 1912, and is expected to be in full operation by the end of January. Up to the present, four buildings and a stockyard runway have been erected. The last named extends east and west for a distance of 520 feet and is served by a ten-ton electric crane. The four buildings comprise power house, offices, main shop and paint shop. All steel work is by the McClintock-Marshall Construction Co., Pottstown, Pa., and the buildings are of that company's standard monitor type of construction. For a height of eight feet above ground level the walls are of National Fireproofing Co.'s hollow tile construction, and above this they are fitted with Lupton continuous steel sash.



The main building is 560 feet long by 200 feet wide and is divided into two bays of 75 feet and one of 50 feet. The 50-feet bay is divided up into forge shop, machine shop, truck shop, tool room and pipe shop. These departments stand next to one another in the order named, the forge shop being at the north end next to the stock yard. Hence, it will be seen that material passes continuously along from one department to another without change of direction. This bay is served by a five-ton Whiting crane. The centre bay (75 feet) is served by two ten-ton Whiting cranes, and is divided up into punch shop (75 x 200 feet), construction department (75 x 80 feet) and steel car erecting shop (75 x 280 feet). The other 75-foot bay is on the west side of the shop and forms the planing mill and wood car erecting shop. The equipment is now being rapidly installed and is of the most modern description in every particular. All machines have individual motor drives and, wherever possible, are fitted with safety guards. In the planing mill, dust and shavings are carried away to the boiler house by exhaust blowers. Heating is by the indirect system, this installation having been put in by Sheldons, Ltd., Galt, Ont.

The paint shop is 300 feet south of the main shop and can easily accommodate thirty cars. It measures 250 by 144 feet and has ten tracks served from the main shop by a transfer table.

All the buildings are fitted with an efficient sprinkler system, in addition to which there is a 1,000-gallon steam driven Underwriters' fire pump in the power house. Steam for this and for the steam hammers, air compressor, heating, etc., is supplied by three 280 h.p. Erie City water tube boilers built by the John Inglis Co., Toronto. Compressed air is delivered by a Canadian Ingersoll-Rand steam driven cross-compound Corliss two-stage air compressor of large capacity. The value of the buildings and equipment is about $700,000, and the plant is insured for $1,000,000, this cov-

ering raw material and work under construction in addition to the buildings, machinery, etc.

Before the plant was completed, an order for 1,500 box cars was received and others have since been obtained. Work is going busily ahead and the first car built on the plant has just been turned out.

Officials of the Company.

The executive officers of the company are:—

President—Sir John Gibson, Toronto.

Vice-President and General Manager—Basil Magor, Hamilton.

Secretary-Treasurer—Mostyn Lewis, Montreal.

Purchasing Agent and Assistant Treasurer—A. Butze, Hamilton.

Accountant—L. A. Rodger, Hamilton.

The following is a list of the directors:—

Sir John Gibson, Toronto.
Basil Magor, Hamilton.
W. G. Ross, Montreal.
Wm. Southam, Hamilton.
J. J. Scott, Hamilton.
W. K. Brice, New York.
Wm. Barclay Parsons, New York.
Sir Henry Pellatt, Toronto.
Mortimer B. Davis, Montreal.

SELBY & YOULDEN, KINGSTON FOUNDRY.

IN reviewing Kingston's industries, one that merits more than passing notice is the business of Selby & Youlden, Ltd., or the Kingston Foundry. Walking on Ontario Street, south, past the works of the Canadian Locomotive Company and the entrance to the dock and yards of the Kingston Shipbuilding Company, one faces, at the foot of Union Street, the buildings and plant of the Kingston foundry.

The establishment of the concern dates back three-quarters of a centrury. In 1895 it was rented to Raney, Reid & Selby. After four years of business, the first mentioned partners dropped out, William Reid in 1897, and F. Raney in 1899. Charles Selby, Gore Street, the president of the present concern, continued for a year alone, until, in 1900, he, in conjunction with the late Henry Youlden purchased the property. Three years later it was incorporated. Since the death of Mr. Youlden, Mr. Selby has undertaken the management. Mr. Angus Orr is vice-president, and Mr. M. F. Thompson, secretary-treasurer.

The buildings—machine, boiler, blacksmith and moulding shops, cover a space of 180 feet by 220 feet. The firm has a private wharf 200 feet long, and at this and on the marine ways, 110 feet long, a great deal of repair work is carried on by expert mechanics. The latest machinery has been installed in the work shops, with tools and appliances.

At the present time ninety men are employed in the manufacture of marine and stationary engines and boilers, steam capstans, double and single drum hoisting engines, gasoline engines, etc. A specialty for which the firm is well known, and of which they are the sole agents, is the "Carrol" Propeller wheel.

NEW FOUNDRY OF SHELDON'S, LTD., GALT, ONT.

AMONG other firms whom an increasing volume of business compelled to enlarge their manufacturing facilities during 1912 must be mentioned Messrs. Sheldon's, Ltd., Galt., who have recently built a large extension to their machine and sheet metal working shops, and are now rapidly completing a new foundry of thoroughly up-to-date design and construction.

NEW FOUNDRY OF SHELDONS, LTD.—UNDER CONSTRUCTION.

This new foundry is situated on the north side of the company's property and lies parallel to the old foundry and main bay of the machine shop. The building is steel framed, with curtain walls of hollow tile set in cement mortar. The tile work is coated over with a layer of cement plaster both inside and outside the building. Large window areas are provided in the side and end walls, equipped with Fenestra steel sash, as is also the 40-ft. monitor. The roof is of 2-in. matched boarding covered with Barrett specification roofing.

The foundry is divided into the usual three bays, the centre one being 40 ft. wide and the two wing bays 35 ft. each. The two latter have a height of 17 ft. to the truss chords, while the head room in the main bay is 34 ft. A 15-ton Northern crane of the 3-motor type serves the latter bay, and a second crane of similar capacity may be added when it becomes necessary to extend the foundry, the shop columns and runway having been designed strong enough to carry a 30-ton load. The columns are spaced at 16-ft. centres, thus, so to speak, dividing up the side bays in twelve floors. The north bay will be used for light moulding and machine work. The roof trusses over this bay are made specially strong, it being the intention eventually to install over each floor a 5-ton electric crane of approximately 16-ft. span. The four most westerly floors are now being equipped with these cranes, which are operated from the floor and will serve four heavy moulding machines.

In the south bay are the cleaning room, cupola room and core department, the extreme east end of this bay being occupied by the heating apparatus. The latter is of the Sheldon type, and distributes the heated air by two underground concrete ducts running up each side bay near the crane columns. An outlet at the foot of each column delivers warm air at floor level. Above the heating apparatus, there is a reinforced concrete platform resting on structural steel columns. This carries the lavatories and is reached by a steel stairway. Two cupolas will be installed of 34 in. and 46 in. diameter. The cleaning department will be fully equipped with up-to-date grinders, tumbling mills, etc., and a sand blast apparatus will be installed in an annex at a later date.

The main moulding floor has a 32 ft. by 20 ft. pit of concrete construction, fitted with eyebolts and stayrods for holding down large copes. The 15-ton Northern crane serving this floor has been built to a special specification. It has steel-tyred wheels and an Electric Controller & Mfg. Co.'s dinkey dynamic braking controller on the hoisting mechanism. Provision has been made for the

addition of a 5-ton auxiliary hoist when desired. Power will be supplied for all the cranes by a 50 k.w. motor-generator set delivering current to a three-wire system at 220-110 volts. The cranes and arc lights operate on 220-volts, while the tungsten lamps and some of the motors in the machine shop take 110 volts.

Artificial lighting in the foundry is by Adams-Bagnall flaming arc lamps in the main bay, while the side bays are lighted by 250-watt low voltage tungstens. When finally completed this foundry will have a maximum output of 200 tons per week and will give employment to about 60 men.

With a view to taking care of this increased output, the company have lengthened their machine shop by 150 ft. and have under consideration the addition of another 75 ft. next spring. They will also probably erect a 4 or 5-storey brick building to form a stores department.

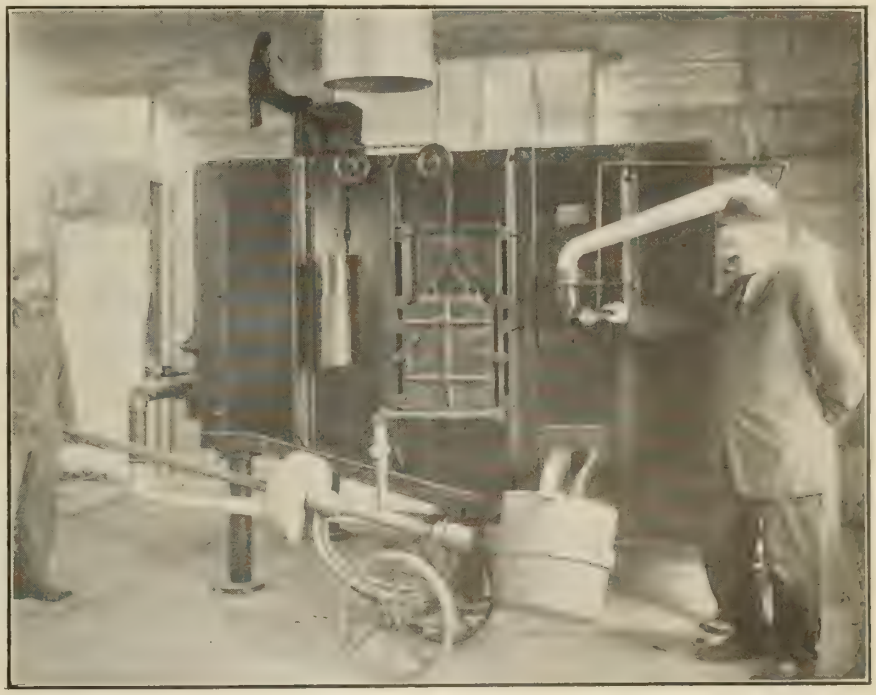
A CREOSOTING PLANT FOR TIES.

WITH contracts to treat from 500,000 to 1,000,000 ties annually for ten years for the Canadian Pacific Railway Co., as well as a contract with the Canadian Northern Railway, a creosoting plant has recently been erected at Transcona, six miles east of Winnipeg, by the Dominion Tar and Chemical Co., Ltd. The plant at present has a capacity of over a million ties a year, but is already being enlarged. It occupies an area of 40 acres. There are four long yard tracks for the storage pipes, with accommodation for 700,000 ties.

The buildings are of steel frame, covered with corrugated iron. Three cylinders are in operation, and a fourth has been ordered. The cylinder doors are swung from a crane attached to the cylinder itself. They receive oil from these tanks, 20 ft. in diameter and 14 ft. high, holding 34,500 gallons.

Three oil-pressure pumps, two vacuum pumps and an air compressor are used in the operation. The ties first have the bark removed, and are then seasoned before treatment. The C.P.R. and C.N. R. contracts specify the Bethell process, and the injection of a minimum of two U.S. gallons per tie. When the timber is not air-seasoned, the ties are steamed, followed by a vacuum. The cylinder is then filled with creosote and the desired amount injected. The oil is next ejected and the ties allowed to stand a while.

A five-ton locomotive crane is used for handling the treated ties. Steam for the plant comes from two 450 horsepower Babcock and Wilcox boilers. Electricity is generated from a 350 amp. 100 volt dynamo driven by a 50 h.p. engine. There is a machine shop near the boilers. Over 135 workmen are employed on the plant, which is directed by Mr. F. W. Coates, manager, and Mr. G. G. Roberts, assistant manager.



The ties treated are principally jack pine, Norway pine, tamarack, and white spruce. Trials are also being made with British Columbia spruce and fir, and black spruce and poplar from Ontario. Most of the oil used comes from the distilling plants operated by the Dominion Tar and Chemical Co., at Sault Ste Marie, Ont, and Sydney, N.S. The head office of the company is in the Birks Building, Montreal. Mr. E. Bernard Smith is the general manager.

EMPIRE MFG. CO.'S NEW SMELTING PLANT.

DURING the past year the Empire Mfg. Co., Ltd., London, Ont., the well-known brass founders and makers of plumbers' fittings, have added to their plant a new one storey and basement building measuring 150 ft. by 50 ft. It is of reinforced concrete and forms a smelting room, metal stores and laboratory. In the smelting room there has been installed a Rockwell No. 43 reverberatory oil-fired furnace for clarifying reclaiming and refining all metals used by the company for factory purposes. The furnace delivers to the foundry No. 1 quality ingots, thus rendering the works independent of supply. An industrial track runs across the floor alongside the furnace and trucks carrying the ingot molds pass along this, the molds being poured direct from the furnace without the intervention of a ladle. The furnace has a capacity of 3,500 lbs., and three heats per day are run. Before going to the smelter the turnings of course pass through an electro-magnetic separator, which removes all steel and iron chips. The ground floor of the building also contains a very fully equipped laboratory, where analytical tests of raw and finished material are regularly carried out.

The basement forms a metal storage room, and washing and grinding are also done here, the equipment including an inclined rotary wet cinder mill. Here, too, is located a motor driven positive type blower for the Rockwell smelting furnace.

The company's brass foundry is well worth a visit as it is laid out in a thoroughly modern way with a view to economically turning out high-grade castings in large numbers. The machine moulding equipment includes a Berkshire automatic moulding machine for 19 x 13 in. flasks. This is operated by four men and has a capacity of 600 moulds per day. There are also two Tabor pneumatic moulding machines, each having a capacity of 150 moulds per day; each machine is operated by one man. Eight men are kept busy on hand moulding and there are also sixteen core makers. The brass is melted in three Rockwell double-chamber rotary oil furnaces of 1,500 lbs. capacity each. Three to five heats per day are taken off. These furnaces have a hood over them by means of which the waste heat is drawn off by suction fans and used for drying cores.

EMPIRE MFG. CO. NEW 3,500 LB. OIL-FIRED BRASS SMELTING FURNACE

The company's machine shop is very completely equipped for rapid and accurate production and the plant, as a whole, forms one of London's most important industries.

DOMINION WHEEL AND FOUNDRIES, LTD., TORONTO.

DOMINION Wheel and Foundries, Ltd., is a concern that has just been incorporated with a capital of $250,000 for the purpose of manufacturing chilled iron car wheels, brake shoes and other railway castings. The company has secured a site of 4 acres in Toronto at the corner of Eastern Avenue and Cherry Street. Here, the building for the wheel foundry is rapidly nearing completion, and it is altogether likely that before the end of this month, the foundry will be in active operation and turning out 300 wheels per day. The contract for the steel work for the building was let to the Canada Foundry Company who bound themselves to fabricate and erect same in the short space of six weeks from the date of signing the contract.

Mr. J. A. Kilpatrick, who recently resigned his position as General Manager of the Canada Iron Corporation, Montreal, is President and General Manager of the new company, which intends, in the spring to erect further buildings and to take up the manufacture of brake shoes, journal brasses and general railway castings.

Mr. Kilpatrick is also president of the Albany Car Wheel Co., Albany, N.Y., and of the Copp Stove Co., Fort William, Ont.

THE STEEL COMPANY OF CANADA, LTD.

THIS corporation report that their total production for 1912 broke all previous records, and present prospects point to an even larger output during 1913.

Work on the new blooming and rod mill at Hamilton has been pushed ahead as rapidly as possible. The buildings are now completed and as the equipment will be installed this month the mill is expected to be in full operation by the middle of February. This is the most important extension that has been made to any of the plants since the amalgamation of the various concerns comprising the Steel Co. of Canada took place, the total cost being about $1,500,000. The mill is intended to supply billets for all merchant shapes and wire rod for bolts, etc., to the company's various branches which have hitherto been purchasing this semi-finished material from outside sources.

The open hearth plant at Hamilton is being remodelled to suit the requirements of the new mill. Two new furnaces have recently been added, making six in all. A 130-ton mixer has also been installed. Hitherto 6-in. ingots only have been turned out, these being bottom poured in pits. In future, 16-in. top-poured ingots will be produced. For this purpose, the floor pits will be filled in and standard gauge track laid down, allowing ingot cars to enter at one end of the building and, after the ingots are poured, to pass on immediately to the soaking pits in the new blooming mill. The new blooming and billet mill is housed in a building measuring 480 ft. by 60 ft., while the rod and merchant mill is 560 ft. by 80 ft. Both are steel frame buildings with steel sash, the sides being closed in with corrugated sheeting. They were erected by the Hamilton Bridge Works Co.

Equipment Data.

The equipment, which is of the very latest type, is being installed by the Morgan Construction Co., Worcester, Mass., and includes the following:

Two 4-hole gas fired pit furnaces, equipped with Morgan gas producers, having George automatic feeders and Dyblic valves for controlling the gas reversals.

One 34-in. two-high reversing blooming mill, complete with reversing tables.

One 10-in. by 10-in. vertical hot bloom shear, with its tables.

An 18-in Morgan four-train continuous billet mill provided with Edwards flying shears.

One combination rod and bar mill, together with gas-fired Morgan continuous heating furnace, roll trains, Edwards flying shears, cooling bed, bar shears, etc.

The entire equipment will be capable of operating as a unit to a considerable degree—the blooming mill supplying blooms to the billet mill, and the billet mill supplying billets to the rod and bar mills, and will enable the Steel Co. of Canada to produce the various products for which the mills were designed, at a minimum of cost. All of the equipment is to be electrically operated. The blooming mill, with its accessory equipment, is being supplied by the United Engineering & Foundry Co., Pittsburgh, Pa.

Further equipment includes the following cranes:

One stripping crane over the soaking pits.

One charging crane for the reheating furnaces.

One 20-ton overhead traveller.

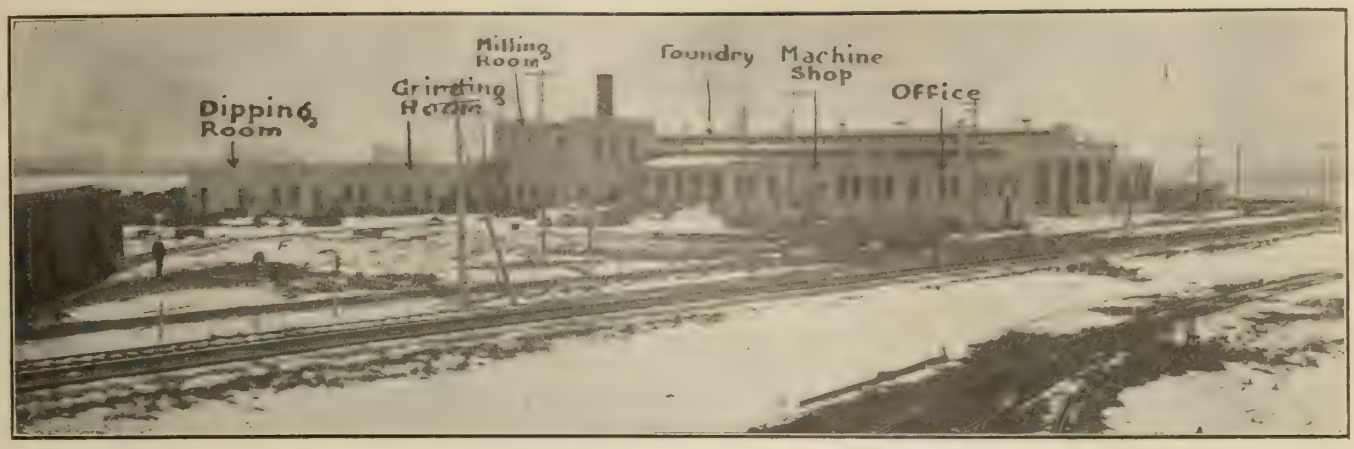
One 5-ton and one 15-ton yard traveller.

It will be seen from the above that the company will soon have at their disposal a thoroughly modern and well-equipped mill.

THE WATEROUS ENGINE WORKS CO., LTD., BRANTFORD, ONT.

THIS old-established firm of engineers have been very busy during 1912. During the first half of the year, work was rushed forward on the new foundry, an illustrated description of which appeared in last month's issue of Canadian Machinery. For the benefit of new readers, however, there is here given a condensed account of this foundry, which went into operation last July.

The new building is on the north side of the plant, and runs parallel with the machine shop. It measures 240 feet long by 110 feet wide, with an extension measuring 68 feet by 30 feet for the core ovens. There is also a gallery which accommodates the sand and coke storage bins, brass foundry, etc.



The moulding, core-making departments and core ovens are all under one roof. The main bay is used for floor moulding and for heavy castings. This bay is served by a 15-ton electric traveling crane, which, by means of a 120-ft. extension, operates outside the building. In addition to this crane, the main floor is served by jib cranes, which are not fixed in one position, but can be transferred from one column to another.

The south 30-ft. bay is used for smaller floor work. It is served by a 5-ton crane, with a span of 26 ft. 6 in. The north 30 ft. bay accommodates the coremakers, bench moulders, cupola room, etc. For 64 ft., it is used for small floor work. The core room has a concrete floor served by a 5-ton electric traveler. There are five core ovens, four of which are 20 ft. long, the other being 12 x 10 ft., and having a revolving shelf for drying small cores.

The gallery extends the full length of the north bay and is 20 feet above main floor level. The coke and sand are elevated to a receiver above the gallery, which has two chutes, one to a large coke storage bin near the cupolas, and the other to a 12-inch rubber belt conveyor which carries the sand to a series of storage bins. The gallery floor is fitted with chutes to the main floor, over which the sand truck passes.

The cupola room measures 32 ft. x 30 ft. It contains two cupolas. The brass foundry occupies a space measuring 32x30 ft., at the east end of the gallery. There are two pit furnaces, and a Kroeschell-Schwartz gyrating flame tilting furnace of 500 lbs. capacity. For fuel, natural gas is used.

These new extensions practically double the foundry output of the Waterous company, which necessarily increases the output of the other departments.

PLANT OF THE ANTHES FOUNDRY CO., WINNIPEG, MAN.

THE ANTHES WINNIPEG FOUNDRY

IN THE Western part of Winnipeg, along Saskatchewan Avenue, two miles or more from the corner of Portage and Main, so many Toronto concerns are building branches and warehouses that the district is given quite an Eastern appearance. Here, between Notre Dame and Portage Avenues, the Anthes Foundry Co. have built a large foundry, larger than the parent building in Toronto. Across the road is the Dominion Bridge Co. plant, and nearby is the new plant of the Canadian Fairbanks-Morse Co., under construction. Excavations have also been begun for the Western branch of the Pease Foundry Co., of Toronto, and within a block is the warehouse of the Canadian Consolidated Rubber Co., of Montreal. In the vicinity, too, the Dominion Radiator Co. will erect a warehouse.

Climatic Conditions Considered.

The Anthes foundry has just been completed. Situated on a five-acre lot it is of brick and steel construction throughout, and of the firm's own special design. The work was carried out under the direction of Mr. E. J. Lennox, architect, of Toronto. The main object of the firm was to give plenty of light, and to erect a building that would best off-set the weather conditions of Manitoba, principally the extreme cold. Whereas, lots of processes might be carried on in Toronto in an open building, in Winnipeg, the latter must be closed and heated during the winter months.

The building has been laid out to give every advantage for a continuous process of production. From the foundry, there follow in order the cleaning and milling room, the inspection room, the oiling room and the yards, where the finished product is stored. The foundry capacity can be doubled without any change being made in the building.

Foundry Lay-Out.

The foundry proper has twenty pipe floors, and thirty fitting floors, giving an output of about 40 tons. The lay-out is such, that, at any time desired, a continuous floor system can be installed without material alteration in the construction of the moulding shop. A feature of this shop is the large proportion of wall area devoted to windows for natural lighting. Artificial illumination is supplied by lantern lights on the roof.

The plant is laid out so that raw material can be taken in from either side direct to the charging floor. Molten metal is carried from the furnace by an overhead I-beam track system, and the finished castings are removed by the same method. An industrial tramway as an auxiliary to the overhead system is being laid.

Castings, as they are taken from the sand are loaded on surface cars, and run direct to the milling rooms, where they are cleaned by being put through a battery of tumbling mills. This completed, they are placed on cars and taken into the grinding and inspection room, immediately adjacent. Here, all the rough edges are ground from the castings, and each piece carefully inspected for sand holes or other defects, each man's work being kept separate. After an inventory has been made of the inspected goods, they are placed on the car again, and conveyed to the oil or dipping room, where they are given a coating of boiled linseed oil, thinned out with benzine and conveyed direct to the shipping warehouse.

The cupola is a 75-inch Colliau, manufactured by Byram & Co., of Detroit. Blast is supplied by a No. 7 Piqua positive blower, driven by a 60 horsepower Crocker-Wheeler three-phase alternating current motor. Owing to extreme cold over night during the winter, it has been found necessary to put a metal damper in the cupola immediately after the bottom is dropped, so that no heat can escape from the foundry.

Grade Their Own Sand.

Because the foundry business in Winnipeg is still in a more or less pioneer stage, foundrymen find it difficult to get a good grade of moulding sand unless imported from a great distance at a high cost. The result is, that those engaged in the iron trade are forced to put in sand grinding and mixing machines, thus practically making their own moulding sand. This has worked out well in the Anthes Foundry, and results are so good that the majority of foundries, irrespective of location, may find it advantageous to grade their own sand.

The machine shop, which is about 40 ft. square, is used for general repairs to equipment and for patternmaking. Provision has been made to extend the machine shop as necessary in the future. The whole plant is operated by hydro-electric power, supplied by the city of Winnipeg, which, it is claimed, is the cheapest power on the American continent. The patterns are kept in fire proof vaults under the office building.

General.

The superintendent's office is the eye of the works, being connected with the machine shop, the foundry, and the yard. The business office is divided into one general office, and two private offices. The woodwork is of stained British Columbia fir, beautifully finished. At present, the foundry buildings are heated by large furnaces placed at intervals along the floors, but this is only temporary. A forced draft system will be installed during the coming summer.

The foundry is situated in the heart of a railway district. About 100 yards distant, the C.N.R. Hope Point branch runs parallel with the west side of the foundry, and parallel with the north side is the Souris branch of the C.P.R. Nearby, are also the Pembina branch of

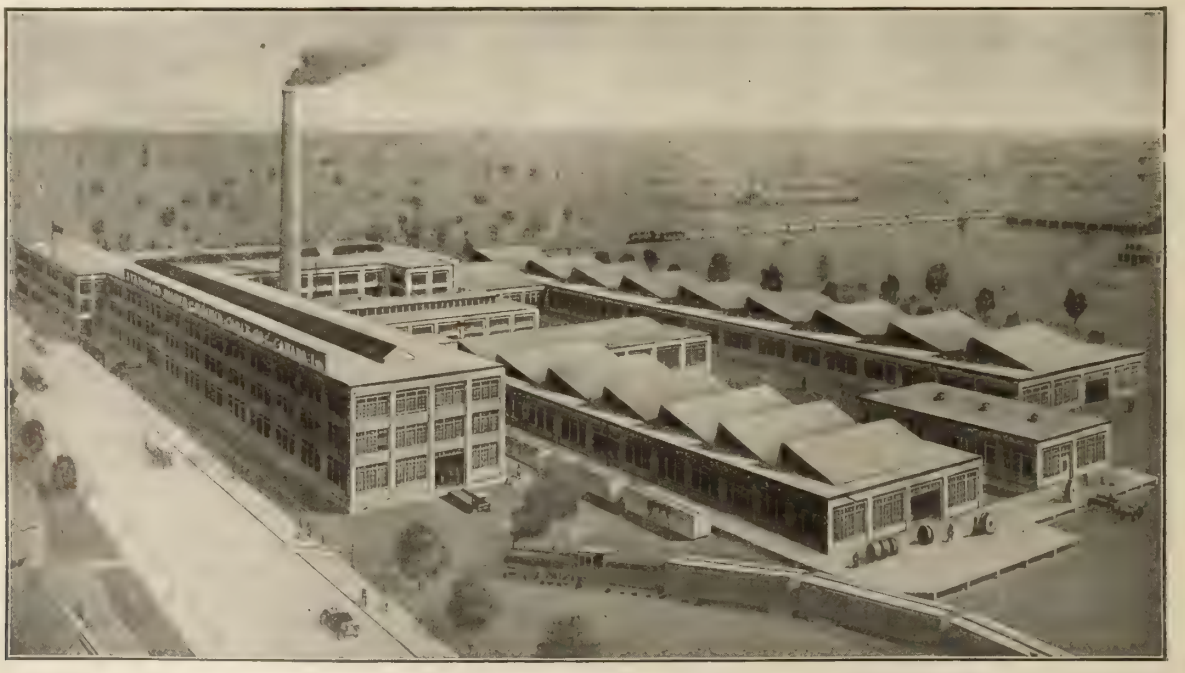
the C.P.R. and the Midland Railway of Manitoba, which is owned by the G.N.R. The latter had intended putting their terminals at this point, but changed their plans, and will now lease all their ground for warehouses. There is also a private spur into the plant.

Trouble With Labor.

The greatest drawback with a foundry in this district is the general scarcity of labor in the summer and fall, on account of the demand on the farms. During October and November, $2.75 to $3 is paid for yard labor. Conditions improve as winter approaches.

Another drawback is the great distance over which raw materials have to be brought, necessitating the high freightage on pig iron and coke. Manufacturers may judge for themselves from the present market price of pig iron in Winnipeg, which is $27 a ton, and $10.60 a ton for foundry coke.

STANDARD UNDERGROUND CABLE CO., OF CANADA, LTD., HAMILTON, ONT.



IT MAY be of interest to our readers to know something of the history of this newcomer into Canadian industrial life some eight months ago. It is not strictly correct, however, to speak of it as a newcomer because the associate American company has been selling to the Canadian trade for many years, its wires, cables and cable accessories being well represented on many important electrical installations in the Dominion. Tracing back the new company's lineage through its associated company, we find the latter to have been a pioneer on this continent in making electric cables for underground service.

The parent company began the manufacture of lead covered cables for transmission of electricity about 1882 in Pittsburgh, Pa. It originated and developed many of the types of cables and manufacturing processes in use to-day and was for years the only manufacturer of such materials in the United States. From the small plant in Pittsburgh the company widened its scope of business and increased its lines of products, until now, in addition to the plant at Pittsburgh, enlarged from time to time, it has a large aggregate of plants at Perth Amboy, N.J., and Oakland, Cal., a total floor space of over 12 acres. The products that come from these various plants include electric wires and cables of all kinds for street railway, light and power, signal, telephone, telegraph, fire alarm, and any other service involving transmission of electric current by underground, aerial or submarine circuits. These products also include cable accessories such as terminals and junction boxes, insulating materials, cable splicing tubes, hangers, etc.

It will be seen that while the company's name carries the implication that it is concerned chiefly with the manufacture of "underground cable" yet, as a matter of fact, its products include almost every kind of conductor known to the electrical industry. Indeed, in range of product and in the aggregate value of gross business, this company is said to exceed any exclusively electric wire and cable manufacturer on the American continent and probably in the world.

The directors have long been aware of the wonderful possibilities of the Canadian field and realized that their company's increasing Canadian business could only be adequately fostered by building a plant in the Dominion that would have every modern facility posessed by the United States plants for turning out high quality products and in sufficient volume to keep pace for many years with the increasing demand resulting from the rapid electrical development of Canada. The choice of locality fell upon Hamilton, Ont., and there the new plant was erected on a tract of land fronting 400 feet on Sherman Avenue and extending 600 feet along the T.H. & B. Railroad, a location which has every advantage, both for manufacturing and shipping.

The buildings erected so far include: One three-storey brick and structural iron building, 64 x 335 feet; one one-storey saw tooth building, 60 x 224 ft.; one one-storey saw tooth building, 60 x 250 feet; one one-storey building, 64 x 90 feet; one one-storey building, 30 x 70 feet; also an office building and other small buildings. They are of the very latest type of factory construction and represent, with their equipment, an investment of $500,000. The plant is electrically operated throughout by power from the Dominion Power and Transmission Co.'s lines. The electric motors are of three-phase, 220-volt induction type. The three testing laboratories are equipped with the most modern and up-to-date appliances for thoroughly testing all products before shipment. These appliances consist of regulating transformers giving voltages as

PLANT OF THE STANDARD UNDERGROUND CABLE CO. OF CANADA, LTD., AT HAMILTON, ONT.

high as 60,000 volts, Wheatstone bridges, D'Arsonval galvonometers, Fisher testing sets, etc., for determining insulation resistances, capacity, conductivity, locating grounds, leads, crosses or other faults in cables.

True to their policy of employing, so far as practicable, Canadian skill in the Canadian venture, the company employed, in the main, Canadian contractors to erect the new buildings and the Hamilton Bridge Works Co., Limited supplied the structural iron. The subcontractors and workmen were all Canadian. The architects were Prack and Perrine, factory experts of Pittsburgh and Hamilton.

STANDARD STEEL CONSTRUCTION COMPANY.

THE Standard Steel Construction Co., Ltd., recently purchased thirty-six acres of land between Welland and Port Robinson on the canal and served by the Grand Trunk and Wabash Railways. There is in course of erection a plant which will have an initial capacity of 500 tons of finished material a month, and which will be in operation in February. There is on order a large amount of stock material which will allow of prompt shipments of steel work for buildings, bridges and similar structures. The officers of the company are: E. O. C. Kunnel, president; and R. W. Knight, vice-president. Mr. Kunnel and Mr. Knight were formerly associated with the McClintic-Marshall Construction Co. of Pittsburg.

TO MAKE 100 MOTOR CARS A DAY.

THE Ford Motor Co., of Walkerville, Ont., are doubling the capacity of their factory. They have just completed a new engine house and are now building a gas producer and boiler house, an addition to the Heat Treatment building measuring 37 x 135 feet, and an addition of four storeys to the main factory measuring 507 x 75 feet. All these new buildings are up-to-date, being fireproof, and of steel and concrete construction. The present building measures 200 x 75 feet. The plant lies along the Detroit River. Wells and Gray, of Toronto, are the architects.

The Ford Motor Co. at present are turning out 50 cars per day. The output will, later, be increased to 100 per day, and it is hoped to manufacture 18,000 cars in 1913. The new factory will provide employment for 2,000 men when in full swing, and will then duplicate the work done in the firm's Detroit plant.

Orders for the new equipment have been placed with the A. R. Williams Machinery Co., of Toronto, amounting to 800 machines, worth altogether about $32,500. These are in the nature of grinders, automatic gear-cutting and gear-shaping machines, special drills, screw machines, lathes, grinders, internal grinders, large presses, heat treating apparatus, bulldozers, compressors, and a large gas producer plant.

In 1909 the production of the Walkerville factory was only 484 cars; the following year 1,265 cars were built. In 1911 the production doubled again, the output being 2,675. The production for 1912 will be 7,000 cars, and in 1913 they hope to turn out 18,000 cars.

Recently, the company purchased fifty acres of land in Sandwich East, near Walkerville, and although no definite decision has been reached as to how this land will be used, Mr. G. M. McGregor, manager of the Walkerville Co., has stated that "If business keeps on growing at the rate it has in the past, we probably will utilize the ground purchased for the erection of large assembling plants. In that case, the present factory would all be used as a machine shop. The new property is ideally located as to shipping facilities, and the shipping probably would all be done from there."

HAMILTON MALLEABLE IRON CO.

THE Hamilton Malleable Iron Co., Hamilton, Ont., have decided to build their plant in the "Ambitious City" after several conferences during the past few weeks between the promoters of the concern and Mr. Marsh, Hamilton Commissioner of Industries. The company has been formed with a capital of $600,000, drawn from Toronto, Hamilton and Brantford.

Although the site has not been definitely decided on, the company have three locations under option in the east and west ends of the city. J. E. Hammond, formerly with Pratt & Letchworth Co., Ltd., Brantford, for 12 years as manager, will be one of the directors, and assume management of the plant. The output will consist principally of malleable iron castings for railroad, agricultural and miscellaneous work for custom trade. The plant will cost in the neighborhood of one-quarter of a million dollars, and will employ about 500 hands, a large number of whom will be skilled mechanics.

The main foundry building will be 600 feet long and 200 feet wide. This building will be divided into two bays, with high speed electric traveling cranes in each bay. In this building will also be located four melting furnaces with a capacity of 15 tons per heat. There will also be located in this building annealing furnaces sufficient to take care of the output, as well as the latest cleaning and finishing equipment. In addition to the main building, there will be an office building, also buildings for pattern storage, pattern shop, machine shop, core shop, carpenter shop and storehouse. Parallel to the main building there will be an outside crane runway, by which all the raw material for the plant will be unloaded and stored.

All the buildings will be fire-proof and of modern construction throughout. The windows will be of metal and glass. Waste heat boilers, molding machines operated by compressed air, the latest type of sand blast installation, exhaust tumbling barrels, will be included in the equipment.

The plant will be connected with the railways and have individual tracks leading to and serving the various buildings. The plans for the buildings are being prepared by Prack & Perrine, 36 James Street south, who will also have charge of the construction and installation of equipment.

The plant is being designed in units, which will allow it to be enlarged to double capacity. A very strong bid was made for this concern by other cities and towns, and Hamilton is very fortunate in securing it. A great many of the factories located here use large quantities of malleable iron castings, such as the National Steel Car Co., and the Sawyer-Massey Co. In deciding to go to Hamilton, the company took into consideration the advantages possessed by Hamilton of favorable freight rates on both raw and finished materials, and also on account of a blast furnace and steel plant being located in this city.

The plant will be in operation by July 1, 1913, and the temporary office of the company is in the Sun Life Building.

CROCKER-WHEELER PLANT.

THE announcement is made that the Canadian Crocker-Wheeler Co. Ltd., will complete their new building in the early part of March. This concern is among the biggest manufacturers of electrical machinery on the continent. It has established extensive works and head office at St. Catharines, maintains Canadian branch offices at Montreal, Toronto and Vancouver, and also has an American head office and works at Ampere, N.J.

The plant comprises a splendid group of buildings, the main building extending 300 ft. in length with an L extension of 100 feet.

The new building now under way will be 290 x 75 feet in area, and two storeys high, built of brick, and of mill construction design. The equipment of machinery to be installed will cost over

$100,000, and will bring the total investment up to $350,000. The company has recently added a new corrugating 12 ft. press, which will cut all the metal transformer tanks and will add 25 per cent. to the speed efficiency of the equipment. The various departments of the plant are the machine shop, pattern shop, punch department, erecting shop, testing, insulation, assembly and stock rooms with upper floor galleries extending along both sides of the building used as the winding department.

The machine shop is 300 ft. long and a cement floor is laid throughout. All machinery is driven by individual motors, there being lathes, drills, presses, planers, pneumatic grinders, boring machines, etc., and a 30-ton traveling crane. The pattern shop has its own outfit of lathes, planers and saws.

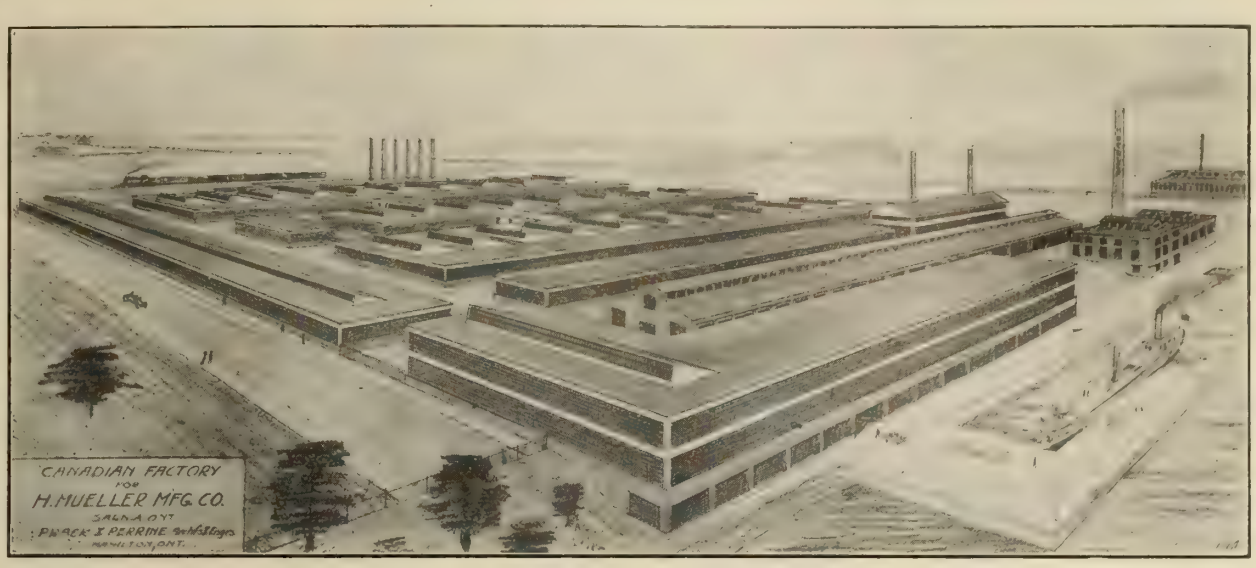
The standard line of Crocker-Wheeler apparatus includes all types of motors, generators of engine coupled, belted and turbo types, motor-generator sets in all types, a complete line of transformers, single, three phase, artificial and self cooled. The core type transformer which is perfectly efficient and reliable, has been adopted by the company as its standard design. It is their aim to produce a transformer of the highest efficiency constructed on the simplest and most rugged plan enabling it to withstand severe and continuous service for an indefinite period.

The mechanical force now numbers 170, and the office staff 30, making a total of 200, and with the completion of the new building, a still larger force will be required.

THE CANADIAN HANSON & VAN WINKLE CO., LTD.

THIS well-known company have, during 1912, erected a $100,000 modern factory on Morrow Avenue, Toronto, and will occupy same by the middle of the present month. A line of goods similar to those produced by the American company will be manufactured. The factory has a 200-ft. siding on the C.P.R., and is of heavy mill construction throughout. The main building measures 110 ft. by 50 ft. and has four storeys. The various departments include a nickel foundry for the supply of nickel anodes, a brass foundry for the supply of brass and copper castings, a facing mill for the production of foundry facings and supplies, a buff and wheel department and an electrical shop for making Hanson & Van Winkle plating dynamos. There are also departments devoted to the manufacture of polishing and grinding machinery, brushes, etc.

A feature of the factory is a complete electro-plating plant where the apparatus constructed and the methods employed by the company can be clearly and thoroughly demonstrated to prospective customers. This is very completely equipped and includes steam jacketed kettles containing solutions of cleaning compounds. Next to these is a steel welded seamless tank containing a Kostico cleaning solution, used instead of the ordinary potash solutions, so commonly employed. This tank is fitted with upright rods, operated from main line driving shaft by cams, thus allowing the dip baskets attached to the end of the rods to be given a constant vertical, agitated movement in the tank, which aids very materially in hastening the cleaning of the work, and also adds to the thoroughness of same. There are also several mechanical plating barrels which will be shown in actual use.



The cost of plating articles, which in the absence of mechanical plating apparatus must be strung or plated in trays, has led to the introduction of various kinds of plating barrels more or less efficient. The cheapening in the cost of plating by the use of such apparatus has been so apparent that everything introduced to the market has been tried, but in the majority of instances due to some mechanical or electrical defect, the plating barrel has been abandoned. In the apparatus manufactured by this company both the electrical and mechanical features have received close attention

GENERAL VIEW OF THE ELECTRO-PLATING DEMONSTRATION PLANT, CANADIAN HANSON & VAN WINKLE CO., LTD.

and have been much simplified. The barrel is entirely submerged, thus permitting a much larger quantity of work in each batch. The drive is from the outside, thus avoiding the use of belts running in the solution. Two speeds are provided. The barrel is removeable at any time, without throwing off the belt or interfering with the drive. The whole apparatus is strongly built and consists of an outer wooden tank for containing the solution, a perforated revolving plating barrel, made of wood or celluloid, in which to hold and tumble the work while deposition is going on, all necessary rods and connections, and a special patent countershaft.

The new factory is heated on the Webster vacuum system from a central heating plant, and is operated by city hydro-electric power.

NEW BRASS FOUNDRY AT SARNIA.

IN order to cater to the demands of eastern and western Canada for water, plumbing and gas brass goods, the H. Mueller Manufacturing Co., Ltd., of Decatur, Ill., are erecting a large factory at Sarnia, Ont. They are, at present, completing only three sections of a large plant which they expect ultimately to erect, one of which is now finished. For a site, the company purchased 73 acres, a part of which had been devoted to a manufacturing enterprise by the Standard Chain Works of Pittsburg, Pa. The Pere Marquette Railway passes through the site, and there is a wharf on the river front.

The brass finishing building, the foundry and power plant are now in course of construction. The buildings are of concrete and steel, and are fireproof. The roofs are of the sawtooth type, with the most approved lighting and ventilating devices. The sides of the building are largely windows, with steel sash and ribbed glass. The plans contemplate the employment of 150 men at the start, and the output will reach $150,000 annually.

Oscar B. Mueller, who is the general manager of the Canadian plant, has established his residence at Sarnia. He is also manager of the eastern division of the business in the United States, with headquarters in New York. He will continue in charge of the New York office. It is planned to manufacture in Canada everything manufactured in Decatur, and to add some other lines for which there is a demand in this country.

The officers of the Sarnia company are:—O. B. Mueller, president and general manager; G. G. Heiby, vice-president and superintendent; Adolph Mueller, treasurer; Fred L. Reggin, secretary. The directors are: Phillip Mueller, Fred B. Mueller, Robert Mueller, Adolph Mueller, O. B. Mueller, Carl G. Heiby, and Fred L. Riggin.

Among the men who will operate the new plant, including O. B. Mueller, is Carl G. Heiby, at present foreman of the tool-making department, at Decatur, who goes to the new plant as vice-president and superintendent. Fred L. Riggin becomes secretary of the new company, assistant general manager and assistant treasurer.

Richard Lan will be foreman of the foundry in Sarnia, and W. C. McIntyre, assistant foreman of nickle plating, polishing and buffing in the Decatur plant, will be foreman of the same department at Sarnia. C. W. Padgitt, shipping clerk from the New York office takes charge of the new factory's shipping department and stock department.

Arthur Carroll goes into the upkeep of stock department in Sarnia, and P. W. Blair, foreman of the brass finishing department in Decatur, goes to the new plant as foreman of the same department. Robert Thrift has charge of the accounting, collections and credits, and C. P. Harry, of the advertising department in Decatur, goes into the sales department in Sarnia.

THE WILT TWIST DRILL CO.

THE Wilt Twist Drill Co., of Walkerville, have placed equipment orders for their new factory, in which they intend to make machines of their own patented designs. The best and most modern equipment will be installed. Many influential stockholders are behind the new company, including Walkers, of Walkerville, and prominent men of Detroit. Mr. Wilt has had wide connection with the automobile trade, and was known as a successful manufacturer in Detroit.

The company has a capital stock of $150,000, and the incorporators are: Hobart Anderson Springle, Sidney Cecil Robinson, Walter Chater, Edgar Francis Ladore and Hiram Holicomb Walker, all of Walkerville. The company will manufacture and deal in machines, engines, tools, instruments and mechanical and electrical supplies.

MASSEY-HARRIS CO., LTD., TORONTO.

WITH the completion of the extensions to the foundry of their headquarters plant the Massey-Harris Harris Company will be enabled to greatly increase their output. The foundry will be one of the largest as well as one of the most modern in design to be found in Canada. The extension, now rapidly approaching completion, measures 238 feet long by 95 feet in width, which will make the total length of the foundry proper 528 feet

and the width 95 feet. With the new core department at one end and the cleaning department at the other, the length of the combined buildings is 913 feet. This new extension to the foundry has a rather unique feature, consisting of a basement for the storage of sand and other materials, and a traveling conveyor for delivering these at any point desired.

Four large cupolas, each 96 inches diameter, and having a melting capacity of 25 tons per hour, are being installed. Under ordinary conditions, only two cupolas will be used, the other two being held in reserve or used on alternate days, thus giving ample time to prepare the cupola, and the iron and fuel for charging. The iron and fuel for the cupolas are loaded on small cars, raised to the charging floor on electric elevators, and by means of transfer tables the material can be brought to the cupola, as required. The contents are deposited in the cupola by a pneumatic charging machine. Blast is provided by direct connected motor driven fans.

NEW PLANT OF THE CANADIAN STEEL FOUNDRIES, LTD.

THE largest steel foundry to go into operation in the Dominion during the past year was the new plant of the Canadian Steel Foundries, Ltd., at Longue Pointe, Montreal. This foundry started operation on July 4, 1912, and is now turning out 3,000 tons per month of acid open hearth castings. The firm manufactures locomotive frames, wheel centres, miscellaneous engine castings, double body and truck bolsters, high carbon rolls, gears, dredge buckets, etc., etc. In addition to the regular open hearth products, castings of manganese and vanadium steel are regularly produced. A specialty is made of high grade manganese steel switches, frogs, mates, diamonds and all intersection parts for steam and electric railroads. A large number of manganese castings for dredge work, mining and crushing machinery are also made.

The Foundry.

The foundry measures 436 feet long from north to south, and is 264 feet wide. It is divided into five aisles, one extending across the south end and four running longitudinally from this aisle to the north end of the building. Stock is loaded into charging boxes in the yard and brought into the foundry to the west aisle which is served by a 15-ton Dominion Bridge traveling crane. Stock is charged into furnaces by a Morgan 5-ton, 4-motor, high type charging machine. There are two 25-ton acid furnaces using oil fuel, and provision has been made for increasing this number if necessary. The furnaces are of very heavy and substantial construction and are arranged to use either gas or oil. The regenerative furnaces are built with both gas and air chambers, the former being bricked up. Should the supply of oil be cut off or the price become prohibitive, a producer can be installed.

The Fettling Shop.

After castings are poured and shaken out they go to the fettling shop, which extends right across the south end of the building. For handling castings in this shop there is a 30-ton Morgan, and a 15-ton Dominion Bridge crane, together with a Whiting electric traveling wall jib. There is the usual equipment of compressed air chipping hammers and small machines. The cold saws consist of one 12-inch, two 20-inch and one 50-inch Newton, the two latter being driven by a 10 and 15 h.p. d.c. motor, respectively. Most noticeable of the larger machines are the Bertram 48-inch lathe direct driven by a 35 h.p. Canadian General Electric motor, and a special Morton traveling double head shaper with 40 ft. bed, specially designed for steel foundry work on frames, etc.

The two straightening presses are located in aisle A. One is a 170-ton press with a 10 h.p. d.c. motor, the other is 400-ton with a 25 h.p. motor. Both machines were built by John Bertram & Sons to the Canadian Steel Foundries' special design.

Machine Shop.

The machine shop has a total size of 203 feet by 86 feet, the entire area being served by two five-ton three-motor Niles-Bement-Pond cranes. The crane way is carried from the roof trusses, no central columns being used. This was done to secure free space for laying out railway intersections which are finished in this shop. The equipment differs from that of the ordinary machine shop, in that it consists largely of swing frame grinding machines. These are used for finishing manganese switches, diamonds, etc., which cannot be machined by steel tools on account of their hardness. The floor is of wooden blocks as is the pattern shop.

In addition to the swing frame grinders mentioned above, the more important equipment in the machine shop includes: a 48 in. x 48 in. x 12 ft. motor driven open side planer by the John Bertram & Sons Co.; one motor driven 6 ft. radial drill by the Canada Machinery Corporation; one belt driven 6 ft. radial drill of the same make; one 3 ft. belt driven radial drill, also by the Canada Machinery Corporation; one 14 in. Leblond engine lathe; one 14 in. quick change back geared lathe (Leblond); one 20 in. by 12 ft. engine lathe by the Hamilton Tool Works, Hamilton, Ohio; one No. 3 bolt cutter by Brown & Co., East Hampton, Conn.; two 20 in. vertical drills by A. A. Jones, Pollard & Shipman, Leicester, Eng.; one 6 in. high speed draw-cut saw by the Racine Tool & Machine Co., Racine, Wis.; and a motor-driven No. 4 floor grinder by the Bridgeport Safety Emery Wheel Co., Bridgeport, Conn. Other equipment will be added as required.

For further particulars of this fine foundry, readers are referred to the issue of "CANADIAN MACHINERY" for November, 1912, where it was fully described and illustrated.

FACTORY FOR GALVANIZING CONDUITS.

A NEW factory opened its doors for business at the beginning of this year, at the foot of Broadview Avenue, Toronto. The product is galvanized conduits, treated both inside and outside by a hot galvanized process. The firm goes under the name of the Greenfield Conduit Co., Ltd., with head office at 70 King street west, Toronto. The manufacturing rights for Canada were purchased at considerable cost from the inventor of the process, Col. Greenfield, New York, who is manufacturing a similar product in that city. The president of the Canadian concern is Mr. F. B. Johnston, of Toronto, and the secretary Mr. C. W. Bongard, of the same city. The advantages claimed by this company for their electric conduits is that when bent, the zinc does not peel off, and further, that being galvanized on both sides there is no possibility of the pipe rusting.

A large brick and steel building with a concrete floor, has been erected on Broadview avenue, 150 x 55 feet., and there is plenty of land in front to allow of extension, which it is expected will become necessary in the spring. The surplus ground is being used at present for storing pipe. In an annex to the main building is the pickling department, where all rust and dirt is first removed. From here the pipes pass to a zinc bath, and are carried by rollers along an iron bar. En route they are treated by compressed air, which forces all surplus zinc away, and the pipe receives its final cleaning from an asbestos tassle over which it passes. The finished product is thrown automatically into heaps. The pipes are threaded in the same building, and finished complete, ready for use.

Mr. Fridolin Polzer, superintendent, who came from New York, to erect and manage the plant, claims that he can turn out 70,000 feet a day, in sizes from ½ to 3 inches.

with the factory. Power is supplied from independent motors, which aggregate 50 horse power. The cost of the building with equipment was between $75,000 and $100,000.

MARSH & HENTHORN, NEW PLANT, BELLEVILLE, ONT.

ONE of the most striking features in the rapid development and upbuilding of this country is the all important part which the hoisting engine plays in connection therewith. The firm of Marsh & Henthorn, Ltd., Belleville, who were among the first in the Dominion to recognize this fact and take advantage of it by constructing hoisting machinery, have since specialized in this phase of engineering work, with the result that to-day their hoisting engines are now in use everywhere. On almost every large building contract may be found one or more hoists made by this concern. Railway contractors also favor this hoist, and large numbers are used throughout the mining camps; in fact, wherever there is any development going on, you will find somewhere in the neighborhood a Marsh & Henthorn hoisting engine. The demand during the last few years has been so great that the company, while continually adding new machinery to their old plant, have found the latter to be entirely too small to keep abreast with the times, and they have been forced to build a complete new factory of the most modern type.

The site covers nine acres. and its location is exceptionally good, presenting many advantages from a manufacturing point of view, being on the north side of the beautiful Bay of Quinte and adjacent to the Canadian Northern and C.P.R. main lines. The buildings which are now nearly completed embody all the best features of modern manufacturing plant design and construction, provision being made for future extension on each separate building.

The accompanying plan shows a general layout of the buildings. A spur track runs alongside of the foundry so that sand, iron, coke, etc., can be unloaded directly into the bins. This track also runs through the east end of the erecting and boiler shops, facilitating the handling of raw material and shipping, and cutting down expenses to a minimum. Traveling cranes are also provided to run the whole length of these two shops. All the shops are uniformly lighted; steel sash windows being employed throughout.

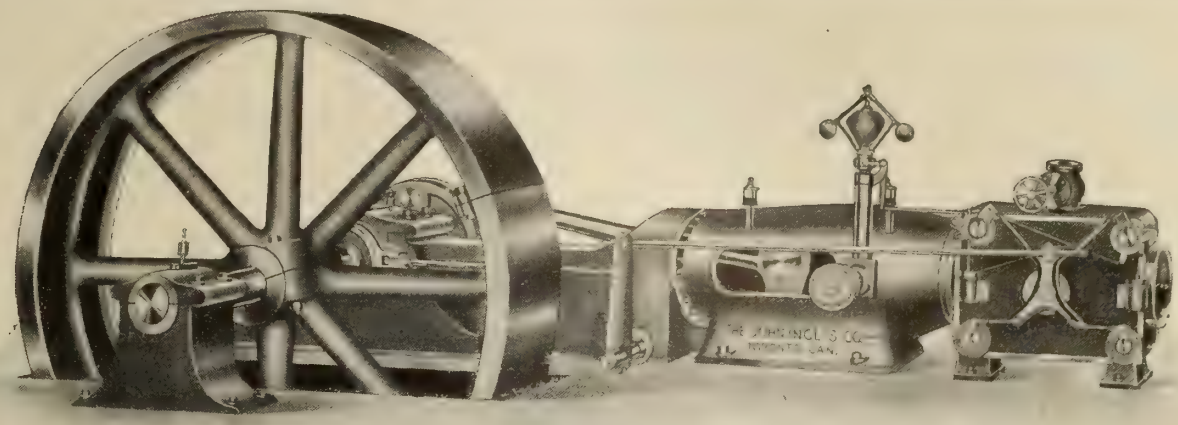
MARSH & HENTHORN, LTD., BELLEVILLE, ONT. PLAN OF THE WORKS.

The pattern shop and pattern storage are of absolutely fire proof construction; the pattern storage being two-storeys high with concrete roof and floors.

The foundry is specially designed for the class of work required, and an industrial track runs from this department into and under the crane in the machine shop. so that large castings may be lifted with the crane in the foundry, placed on the car and handled again with the machine shop crane, thus eliminating all heavy manual labor. The cupola is of the latest type, and the charging platform is fed by an elevator, thus obviating heavy lifting on the part of the attendant. The cleaning room is fitted with a cylinder mill and emery wheels; provision is also made for a sand blast apparatus.

In the machine shop there is a large centre bay served by a heavy duty traveling crane, under which a few of the heavist t ols are located. The two side bays will be equipped with machine tools and fitters' benches, and all heavy engines, etc., will be entered at the end nearest the tracks, where they will be tested, finally painted and finished ready for shipping.

The stores and tool room is built between the machine and blacksmith shops, and as will be seen, is about centrally located.



The blacksmith shop will be equipped with four forges, a 600-lb. hammer driven by compressed air, also a shear and punching machine and an electrically driven blower. Specially designed racks will be used for storing bar iron.

The boiler shop is provided with all the latest tools for the rapid construction of boiler and tank work. The large bay, which is traversed by a heavy traveling crane, is equipped with all the heavy tools, comprising clamps, rolls, punch and shears. At the extreme west end a new type 70-ton deep throat pneumatic rivetter is located, above which is a tower 60 feet high. Boilers, tanks, flumes, etc., will be hoisted up into this tower and lowered into the riveter which forms the rivet head and completes the riveting at one stroke with a compression of 70 tons. The side bay is equipped with drilling machines, emery wheels, small punches and special tools, also a deep throat horizontal punch for special boiler firebox work, etc. An electrically driven two-stage compressor is also located in an enclosure under this bay, and this will supply compressed air to the various hammers, reamers, chippers and riveters. A large jib crane is fitted outside the boiler shop alongside the track for handling large tank work, etc.

The whole factory is heated from a central heating plant on the vacuum system, a large boiler and the necessary pumps being located in the power house.

The whole of the works will be electric driven, with separate motors for each department. The power plant will consist of eight alternating current motors, ranging from 60 h.p. to 5 h.p. Illumination will also be electric, Tungsten lamps being used throughout.

In the matters of lighting, ventilation, heating and fire protection, the factory represents the latest word in efficiency and safeguarding of the health and comfort of employees. Over fifty different types and sizes of hoist are made to suit

Other People's Opinions Are What Count

Anything we would say about our power plant equipment might be considered biased.

We acknowledge no superiors in the art of building high efficiency pumps, engines and boilers, but we would prefer to let our customers speak for us.

If you wish to instal a complete power plant or a new unit, write us at once, and we will be pleased to submit you names of previous purchasers for reference.

THE JOHN INGLIS COMPANY, Ltd.

Engineers and Boilermakers

Strachan Ave., TORONTO

various requirements, while another leading specialty is the manufacture of all kinds of tanks, contractors' dump buckets and dump cars.

Marsh & Henthorn are, we understand, the largest makers of small vertical boilers in Canada, having just closed a single order for 66 of this type. In the near future, we will give a more detailed description, dealing with the equipment, and showing the methods of manufacture employed in this interesting and up-to-date plant.

STEEL WORKS AT ST. JOHN, N.B.

THE capital required for the establishment of the proposed iron and steel works at St. John, N.B., has been fully subscribed by English financiers, according to the latest reports. Arrangements with Messrs. Drummond, of Montreal, to transfer their works from Londonderry to St. John, and to establish a modern plant in connection with the big scheme, have been completed.

There have been rumors at one time and another of considerable ore in New Brunswick, and it may be that it is within sufficient distance of St. John to justify the establishment of a steel plant.

OGDEN SHOPS OF THE C.P.R., NEAR CALGARY.

THE new shops of the Canadian Pacific Railway at Ogden, near Calgary, Alta., are now rapidly nearing completion and a commencement is being made with the installation of the equipment. The site is approximately in the shape of an equilateral triangle with the apex cut off, and allows ample space for doubling the size of the plant when required.

The locomotive shop, machine shop, blacksmith shop and boiler shop are all grouped together in one large building running perpendicularly to the base of the triangle. This, in common with the other principal buildings, is a steel framed structure and measures 773 ft. by 305 ft. The locomotive shop has 35 transverse pits served by a 120-ton crane, with a 10-ton messenger crane below. There is also a liberal provision of jib cranes on the shop columns.

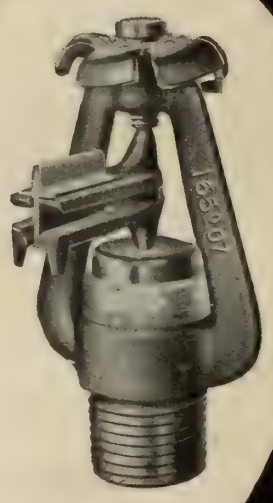
The heavy and light machine bays run parallel to the erecting shop on one side, while on the opposite side is the blacksmiths' shop and boiler shop, which lie end to end with one another. The blacksmiths' shop is in two bays, that next to the erecting shop containing the hammers and forges, while the other accommodates the forging machines, bull-dozers, etc., together with the attendant furnaces.

The boiler shop is also in two bays, that next to the erecting shop is served by a 15-ton traveler and forms the marking off floor and assembling department; the other bay contains the machine tool equipment. The whole of this large building, which covers considerably more than 5 acres, is heated by indirect radiation, the hot air being distributed by underground ducts.

All tracks run at right angles to the big shop, and at one end of it, and between it and the stores building, there is a large stock yard 1,260 ft. long, served by a 10-ton crane of 80 ft. span. This serves for the receipt of raw material and for the shipping of scrap. The tender shop is a separate building having the shape of a letter L. One leg is devoted to tender tank repairs and the other is occupied by machine tools such as wheel lathes, axles lathes, car wheel borers, etc.

The coach repair and paint shop, 362 ft. by 146 ft., contains 15 tracks. This building is of mill construction similar to the company's coach shops at Montreal. In addition to serving as a coach building shop, it provides space for an air-brake shop, upholstering shop, varnishing room, etc. When necessary, a second

FIRE RISKS OF FOUNDRIES.



Canadian Foundryman
Dec. 1912

of an exhaustive report. It was shown, among other things, that the insurance rate per $100 risk was immensely lower where adequate means for discovering and fighting fire had been taken than in other cases. For instance, irrespective of building construction, the foundries provided with automatic sprinklers had an average rate of only 10½c as compared with 96½c for the best type of construction, but without sprinklers. The difference here is tremendous, and has been made the basis of recommendations that those foundries which are not satisfactorily protected should take advantage of the means at hand to safeguard themselves from disastrous fire, and, at the same time, reduce their insurance outlay. It has been shown that the premium reduction can be depended upon, in many cases, to pay for the complete equipment within a period of four or five years, after which there is clear gain

How Much Would Fire Sprinklers Save You?

What is good for the protection of Foundries is good for the protection of shop, factory and office.

No manufacturer should have his plant unprotected when the most efficient protection on earth will actually pay for its installation by the saving of insurance premiums.

93-97 Adelaide Street West, TORONTO

coach shop will be built on the opposite side of the transfer table pit, which will thus serve both.

The planing mill, 300 x 80 ft., is near the freight car repair shop, and has its wood-working machinery carefully laid out so that lumber passes continuously forward from one end of the mill to the other. The freight car repair shop, 303 ft. by 231 ft., has eight through tracks and can accommodate 48 cars. Along one side of the shop is a bay, 50 ft. wide, containing the heating plant and car blacksmiths' shop.

Power for operating the plant is purchased from an outside source, but there is a central boiler house to furnish steam for the forge hammers and for heating and other purposes. This boiler house is situated about 200 feet from the planing mill, the refuse from which is here consumed.

The foundry and pattern shop are situated parallel with one another towards the south-east corner of the site. The pattern shop measures 98 x 31 ft., and the foundry 203 x 80 ft. They stand at some considerable distance from the main locomotive shop to allow for extensions to the latter in the future.

The plans for the buildings and the general layout were got out by Westinghouse, Church, Kerr & Co., New York, Montreal and Vancouver, who are also constructing the buildings and supplying the equipment.

WESTERN DRY DOCK AND SHIPBUILDING COMPANY.

THE Western Dry Dock and Shipbuilding Co., Port Arthur, Ont., advise us that during the past summer they have erected a two-storey joiner shop, 105 x 50 ft., equipped with all the latest wood-working machinery. They have also built a warehouse, 60 x 100 ft., of brick and steel structural work; a power house of brick and steel 90 x 50 ft.; also a machine shop, which is nearing completion, 90 x 180 ft., built of structural steel and brick, equipped with two 15-ton electric traveling cranes and one 3-ton traveling crane, together with modern machinery. During the year they delivered one Welland Canal-size package freighter for the Inter-Lake & Ocean Navigation Co., Ltd., of which Mr. J. W. Norcross is manager. They have also built one 200 ft. stern wheel freight and passenger boat to the order of the Canadian Pacific Railway, for its Kootenay Lake service, same having been shipped from Port Arthur to Nelson, B.C., in knock-down condition and erected there for launching. There is under contract another Welland Canal-size package freighter, a duplicate and for the same parties as the one above mentioned. Construction has also commenced on a passenger boat for the Northern Navigation Co., to be built on the same general lines as the steamer Hamonic; 385 ft. long, 52 ft. moulded breadth, and 28 ft. 9 inches moulded depth, for delivery this year. In addition to the foregoing, a large amount of repair work has been put through.

THE SCHAAKE MACHINE WORKS.

THE Schaake Machine Works, New Westminster, B.C., have begun the construction of an entirely new plant on a site of five acres recently purchased in the city of New Westminster. There is a water frontage of 650 feet, and railway trackage in the rear. The main machine shop building will be 90 x 300 ft., the store room, 100 x 150 ft.; foundry 80 x 200 ft.; pattern shop and storage 95 x 100 ft. (two storeys); blacksmith shop 40 x 60 ft.; office building 40 x 60 suit the economical construction of the most modern tools that can be bought to suit the economical construction of our product—saw and shingle mill machinery, canning machinery, gasoline and Diesel oil engines. The investment in plant and buildings will be in the neighborhood of $400.000, and the buildings are arranged to allow for extension. There will be a large wharf and frontage for docking vessels, and railroad trackage directly in and around the buildings, which connects with three trans-continental roads.

NEW METAL SASH FACTORY.

PETERBOROUGH, Ont., is fortunate in securing a new factory—that of Henry Hope & Sons, Ltd., of Birmingham, England, who will erect a machine shop, about 100 x 200 ft. in which to manufacture metal sashes. About fifty men will be employed at the beginning. Messrs. Sproatt & Rolph, of Toronto, are the architects. H. D. Hope, president of the English company is also president of the Canadian concern. A. L. Young, of Toronto, is vice-president, secretary-treasurer and manager. David McGill, of Montreal, is a director.

The site of the new factory, which has been given by the town of Peterborough, is bounded by Park, Romaine and Monaghan streets, and is about 2,000 x 220 ft. It is served by the C.P.R. and G.T.R. The plant will be a model daylight one, with employes' lunch, rest rooms, recreation grounds, etc. Only the steel sash and patent roof glazing will be manufactured here to begin with.

Mr. A. L. Young, vice-president of the company, was connected for twenty-seven years with the Aikenhead Hardware, Ltd., of Toronto.

LAKE SUPERIOR CORPORATION.

AT the annual meeting of the shareholders of the Lake Superior Corporation, held at Camden, N.J., recently, the President, Mr. T. J. Drummond, in his annual address, reviewed the progress of the Corporation for the year ending June 30, 1912. His speech showed that the progress of the Corporation during the past year had been good, the operations of its subsidiary companies successful, and pointed out that the prospects for the coming year were of the brightest He said in part that the earnings from the operations of the subsidiary companies for the year amounted to $1,579,000, an increase of 30 per cent. over last year, and that there was a balance over and above bond interest of $1,148,000. Under the favorable conditions existing, the directors had been able to declare the full interest of 5 per cent. on the income bonds, as against 2½ per cent. paid in 1910-11, 1909-10.

The construction of the Algoma Central Railway had been completed to the main line of the Canadian Pacific; the extension to the Canadian Northern would be completed within a few months and that to the Grand Trunk Pacific by the fall this year. The prospects of the railway were good. The extension of the Algoma Eastern Railway was being pushed on, and business on the part of the line in operation showed an increase, and was satisfactory.

The completion and commencement of operation of the paper mills of the Lake Superior Paper Company would materially increase the earnings of the subsidiary companies of the Corporation, as the paper company was a large user of power and a large consumer of wood.

The most important development of the year had been the successful flotation of the Algoma Steel Corporation, which took over the plants, properties and business of the Algoma Steel Company, the Lake Superior Power Company, and other subsidiaries. As a result of this consolidation the short-term notes ($5,000,000) of the corporation had been redeemed, and the finances of the Corporation put on a sound and permanent basis. New blooming and rail mills had been installed, and the output of the steel plant very materially increased, but in spite of this it was difficult to meet the existing demand in Canada for steel products, and still further extensions would be necessary. The president reminded the shareholders of the great potential value of the mines and lands owned by the subsidiary companies, and that the Corporation owned equities in

3,000,000 acres of land. most of which was covered by high-grade pulpwood. from which revenues were being obtained, and that they had already located on their land iron ore deposits of great value. The earnings for the first two months of the present fiscal year had proved most satisfactory, and orders for the steel products were such as to insure the operations of the plants at full capacity.

THE NATIONAL IRON WORKS.

THE National Iron Works, Ltd., Toronto, manufacturers of cast iron water and gas pipe, are making an extension to their present foundry which will more than double its capacity. This addition is for the manufacture of cast iron water and gas pipe from 12 inches to 60 inches in diameter, and it is hoped it will be completed not later than September, 1913. Their total output will then be in the neighborhood of 175 tons per day. They are also extending their present docks 1,000 feet. These docks are of concrete and steel construction.

FURNACE FOR PORT COLBORNE.

A MODERN blast furnace is being erected at Port Colborne, Ont., by the Buffalo Union Furnace Co., of Buffalo. N.Y., on a site partly under lease from the Government, measuring 60 acres. It is their intention to manufacture high grade foundry, malleable and basic pig iron, and other grades for which they find a market. The firm has been supplying the Canadian trade from the Buffalo plant, but will now do their manufacturing in Canada. The plans at present contemplate one blast furnace of a capacity of about 350 tons per day, to be increased from time to time. They will also engage in the manufacture of some finished products from their own pig iron, although plans on this point are indefinite at present.

FOUNDRY AND MACHINE SHOP.

Ottawa, Ont.—An $80,000 contract has been let by the Canadian Government to the Canadian Bridge Co. for the construction of steel bridge work over the Managuish river and Canyon creek, on the line of the National Transcontinental railway.

Calgary, Alta.—Thirty engines per month will be the capacity of the new Canadian Pacific railway repair shops which will be finished at the end of the year. The erecting of these shops has called for an expenditure of $2,000,000.

Moose Jaw, Sask.—New boilers have been erected at the city power house. The roof trusses were supplied by the Saskatchewan Bridge and Iron Works.

Vancouver, B.C.—Fire almost completely destroyed the plant of the Hoffar Motor Boat Co. here, December 11. The loss will be about $14,000. The firm carried about $8,000 insurance.

Leamington, Ont.—The Detroit Motor Cycle Co. recently met the business men here and proposed to establish a factory in this town. A committee was sent to examine the plant in Detroit.

Brandon, Man.—The Emerson-Brantingham Co., Rockford, Ill., will establish a factory in Brandon, Man., to manufacture agricultural implements.

Petrolea, Ont.—The Petrolea Motor Car Co plans an addition to its automobile factory at Petrolea, Ont. A by-law will be submitted to the tax payers to grant a $10,000 bonus for the extension.

Kingsville, Ont.—R. F. Greene & Co., is building an addition to its foundry and machine shop at Kingsville, Ont., and will need new foundry and machine shop equipment

Quebec, Que.—The Quebec Structural Steel Co., Ltd., will next spring build a steel manufacturing plant to cost $300,000 at Quebec. Que. The company will manufacture structural steel beams.

Guelph, Ont.—The independent Tire Co., of Guelph, Ont., has ordered five carloads of machinery from the Farrel Foundry & Machine Co., of Ansonia, Conn.

Portage La Prairie, Man.—The Economy Foundry Co., with works at Portage La Prairie, Man., and office at Winnipeg, advises that it is now operating a foundry, manufacturing light and heavy gray iron castings The company also intends to operate another cupola on semi-steel castings. It is making machine castings of every description, heavy sewer castings, water works supplies and structural castings for buildings. In addition to its foundry the company has a well equipped pattern shop and machine shop.

Montreal, Que.—The Canadian Car & Foundry Co., Ltd., Montreal, Que., reports that it has at the close of the present year unfilled orders to the amount of $16,000,000. The annual meeting of the company took place in Montreal, Que., last week when a surplus of $1,056,334.25 for the year was reported. The company has under way extensive works at Fort William, Ont.

Hamilton, Ont.—The Canada Screw Co., Hamilton, Ont., is having two small additions, each 80 x 40 feet, built to its plant.

Saskatoon, Sask.—It is reported that certain members of the Slav colony will invest the sum of $50,000 in a plant for the manufacture of all varieties of iron and sheet steel articles. Mr. C. J. Alexander is interested in this project, which is to be known as the Toil Corporation, Ltd.

Peterborough, Ont.—Henry Hope and Sons, Ltd., of Birmingham, England, will build a factory here for the manufacture of steel sash and roofing. It will be north of and adjacent to the De Laval Dairy Supply Co. on Park St. They will employ at least fifty hands to start with. The concern is capitalized at $240,000, $120,000 of which is preferred stock. The new factory, 80 x 200 ft., will be of brick and steel, one storey high, and will cost altogether $60,000. The city grants a free site and exemption from taxes for ten years.

Peterborough, Ont.—The Peterborough Machine and Lubrication Co., Ltd., has been incorporated, with E. R. Wilson and Alex. Gillespie as two of the provisional directors. The capital is $60,000. The company will manufacture and deal in dies, tools, motors, engines, launches, boats, automobiles, and will manufacture the automatic grease cups invented by John Francis Lewis.

Oil Springs, Ont.—Mr. Robert McGregor, of Sarnia, a former resident here, has purchased the machine shop of Mr. R. A. Holme.

Owen Sound, Ont.—The Northern Bolt & Screw Co's. building is finished, and the machinery is being installed. West of the bolt works, the Wire and Nail Factory is nearing completion, and west of the nail works is the power house, of solid concrete, in which the boilers have been installed. The west end of the old C.P.R. No. 3 shed will be used as a keg and box factory. Both plants were expected to be running by the first of the year.

Magog, Que.—The Magog Foundry Co. will equip a new foundry at a cost of $50,000.

Kenora, Ont.—The Thurber Co. will equip a machine shop, costing $25,000, in connection with its gold-extracting plant. James Weidman is the manager.

Lindsay, Ont.—Madison Williams & Son are having plans prepared for a new three-storey garage and repair shop, to be erected here.

London, Ont.—The London Motor Sales Co. London, Ont., will erect a large garage and repair shop. New equipment, including an electric elevator, will be purchased. Chas. Abbott is the manager.

St. Thomas, Ont.—Bids will shortly be asked by the Erie Iron Works, St. Thomas, Ont., for an addition to its plant. Much new machinery will be installed.

Regina, Sask.—The Minneapolis Threshing Co., Minneapolis, Minn., plans to erect a branch factory for the manufacture of its products at Regina, Sask. T. H. Roney is the manager.

Hanover, Ont.—The Fisher Machinery Co., Ltd., recently incorporated with a capital of $500,000, will erect a foundry and machine shop. Wm. H. and Arthur W. Fisher, David and Jacob S. Knechtel, and B. F. Ahrens are incorporators.

Ottawa, Ont.—The Campbell Steel & Iron Co., Ltd., will erect a factory on Carling Ave., to cost $40,000. New machinery will be purchased.

Toronto, Ont.—The Bateman-Wilkinson Co., Ltd., has been incorporated with an author-

The Commissioners of the Transcontinental Railway

NOTICE TO CONTRACTORS

Tenders for Machines, Tools, Appliances, Motors, Furnaces, Cranes, Etc.

SEALED TENDERS, addressed to the undersigned, and marked on the envelope, "Tender for Machines, Tools, Appliances, Motors, Furnaces, Cranes, Etc.," will be received at the office of the Commissioners of the National Transcontinental Railway at Ottawa, until twelve o'clock noon of the Thirteenth day of February, 1913, for the furnishing and delivery of the Machines, Tools, Appliances, Motors, Furnaces, Cranes, Etc., required for the equipment of the Car Department Shops, Transcona Plant, of the Commissioners of the National Transcontinental Railway, at Transcona, Manitoba.

Tenders will be considered for any portion, or all of the equipment.

Specifications and forms of tender may be obtained at the office of Mr. W. J. Press, Mechanical Engineer, Ottawa, Ontario.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied by the Commissioners.

Each tender must be signed and sealed by all the parties to the tender, and witnessed and be accompanied by an accepted cheque on a Chartered Bank of the Dominion of Canada, payable to the Commissioners of the Transcontinental Railway, for a sum equal to ten per cent. (10%) of the amount of the tender.

Any person whose tender is accepted shall, within ten days after the acceptance thereof, sign the contract, specifications and other documents required to be signed and in any case of refusal or failure on the part of the party whose tender is accepted to complete and execute the contract with the Commissioners, the said cheque shall be forfeited to the Commissioners as liquidated damages for such refusal or failure, and all contract right acquired by the acceptance of the tender shall be forfeited.

The cheques deposited by parties whose tenders are accepted will be deposited to the credit of the Receiver General of Canada as security for the due and faithful performance of the contract according to its terms.

The cheques deposited by parties whose tenders are rejected will be returned within ten days after the signing of the contract.

The right is reserved to reject any or all tenders.

By order,

P. E. RYAN,
Secretary.

The Commissioners of the Transcontinental Railway.

Dated at Ottawa, **December 11th, 1912.**

Newspapers inserting this advertisement without authority from the Commissioners will not be paid for it.—32910.

ized capital of $500,000, and is considering plans for a plant to manufacture agricultural machinery, railway and contractors' supplies.

Edmonton, Alta.—The Massey-Harris Co., manufacturers of reapers and other agricultural machinery, has purchased a site at Edmonton, Alta., upon which it will erect an extensive plant as headquarters for northern Alberta.

Windsor, Ont.—The Everett Motor Co., Detroit, Mich., has secured a site of 10 acres here, and will erect a Canadian branch factory.

Edmonton, Alta.—The Presto Heater Co., will erect a factory costing $50,000 here.

Winnipeg, Man.—A site has been purchased here by the William Galloway Co., Waterloo, Iowa, manufacturers of agricultural implements, and a plant will be erected in the spring.

Walkerville, Ont.—The Dominion Stamping Co., of Walkerville, have just completed a new power house, measuring 35 x 75 feet; also a new factory, 145 x 56 feet, four storeys and basement. Both buildings are of reinforced concrete, and of fireproof construction.

Walkerville, Ont.—Walker, Sons, are building an extension to their power house. This extension is a four-storey reinforced concrete building, 112 x 75 feet. The Canadian Detroit Lubricator Co., branch of the Detroit Lubricator Co., of Detroit, are just completing a large new factory building at Walkerville. This is a new plant.

Toronto, Ont.—The Steel and Radiator Co., Ltd., will build a one-storey storage house on St. Helen's Ave., near Dora St., costing $4,000.

Hespeler, Ont.—The big moulding shop of the Canada Machinery Corporation's branch plant at Hespeler was burned to the ground Dec. 11, entailing a loss of $20,000, partly covered by insurance. But for the fire doors the whole plant would have been destroyed.

North Bay, Ont.—It is believed that the Island Smelting Co. will utilize the Trout Lake plant to smelt iron ore from Moose Mountain, and other ore bodies close to North Bay. The Trout Lake plant was installed by Montreal capitalists at a cost of half a million dollars, but died early. For a short time it was used for concentrating ores from Cobalt.

Quebec, Que.—A fire on December 10, completely destroyed the coal sheds of the Nova Scotia Steel & Coal Co. on the Louise Embankment. The loss will be in the vicinity of $20,000. The origin is unknown.

West Toronto, Ont.—The C.P.R. have secured a permit for a $27,000 car shop to be erected near Keele street. It will be a one-storey structure, covering 13,800 square feet.

Coleman, Alta.—Fire broke out in the machine shop of the International Coal and Coke Co. here recently. It spread to the tipple, and threatened the business section of the town. The damage to buildings and machinery amounted to $40,000. The origin is unknown.

Windsor, Ont.—The Everitt Motor Car Co., of Detroit, have bought ten acres of land here for a Canadian plant, which will be one of the largest in the Dominion. The site is the last available in the factory district.

Fort William, Ont.—The Canadian Iron Foundry, Ltd., recently sent a representative of the company to confer with the city council with reference to establishing a plant here.

Harris, Sask.—W. B. Robinson, of Biggar, may open a machine shop here. The Council and Board of Trade are in favor of the industry.

Coquitlam, B.C. — Appropriations covering two million dollars have been made on the east bank of the Pitt River, for the location of a large smelting plant and flour mill. The cost of the plant will exceed $1,500,000, and will employ about 600 men. A spur line is contemplated from the C.P.R. main line to the water front. The above smelter will handle the low-grade copper ores of British Columbia. This ore is now being handled by the smelters in Tacoma.

Phoenix, B.C.—A 2,000-ton smelter and power plant will be erected at Hidden Creek by the Granby Consolidated Copper Co. It is hoped that copper will be shipped from this property before the close of 1913. $2,000,000 will be spent on the smelter and town, between buildings and equipment, the installation of power plant, and on development work.

Stratford, Ont.—A fire involving a loss estimated at $100,000 broke out on Dec. 17 at the works of the Stratford Mill Building Co., Ltd., and resulted in the complete gutting of the engine room, blacksmith shop and machine shop. The firm's books were saved, but the patterns and drawings were all destroyed. Plans have already been formed for rebuilding the plant on an even larger scale.

St. Thomas, Ont.—An American Steel Company, attracted by the advantages of Port

GENERAL MANUFACTURING.

St. John, N.B.—The Norton Griffiths Dredging Company have begun dredging in the channel into Courtenay Bay, and are making rapid progress with the great breakwater. At West St. John the J. D. Metcalf Construction Company have 300 men at work on the foundation of the new grain elevator, and will soon increase the number to 500. Outside of St. John the new Palmer, McLellan Shoepack Company's new factory at Fredericton has begun operations. The Humphrey Unshrinkable Underwear Company, of Moncton, have their carding machines in operation in a four-storey building, and another building is nearly completed.

Toronto, Ont.—The Consumers' Gas Company are preparing to make an addition to their plant of a new purifying house on Eastern avenue. The plans submitted to the city architect's department call for a two-storey brick structure to be erected at a cost of $50,000.

Toronto, Ont.—A permit has been granted to Hinde and Dauche Paper Company for the erection of an $80,000 factory on Hanna avenue, near King Street. The building will be four storeys high and of brick and steel construction.

Vancouver, B.C.—There is a likelihood that the Dominion Tar and Chemical Co. may establish a plant in British Columbia for the manufacture of creosote and other by-products of coal. Mr. Harold Boulton, London, England, director of the company, is at present investigating the prospects.

Calgary, Alta.—The management of the Riverside Sash and Door Co. will erect a large factory in this city.

Kingston, Ont.—The management of the American Creosote Wood Block Preserving Co. are negotiating with the municipal council regarding the location of a branch factory in this city. The ratepayers will be asked to provide a suitable site. The company will establish a plant costing $100,000, and will employ 75 men.

Guelph, Ont.—The Stewart Sheaf Loader Co. will erect a factory here during the spring.

Toronto, Ont.—Ice dealers here will erect a plant for the manufacture of artificial ice. The capacity will be 100 tons per day.

Chatham, Ont.—An American concern will build a large four-storey brick plant here, and employ 70 men, with an annual pay roll of $25,000. They will start operations on February 1, 1913.

Hamilton, Ont.—A company of approximately a million dollars capital has been formed and will manufacture fine hosiery and underwear, which will be sold to the retail trade. The officials and directors of the company are: Mr. John Penman, the founder of the Penman Co., Paris, Ont., who retired in 1906 upon the reorganization of the corporation; Mr. Richard Thompson, formerly general manager of Penman's, Ltd., and Mr. H. G. Smith, who was in charge of the fine hosiery mill of this company. A four-storey and basement brick building on Park St. North, formerly occupied by the Princess Underwear Co., has been purchased from the Eagle Knitting Co. This plant, however, will be of a temporary nature for it is the purpose of the organizers to purchase property and erect a mill embodying the most up-to-date ideas in construction and equipment. They expect to commence operations early in the new year, and will employ 100 hands at the start. When the new factory is erected they will employ between 400 and 500 hands.

Montreal, Que.—The Consumers' Cordage Co., 283 Patrick St., will rebuild its factory, recently burned at a loss of $150,000. New equipment will be required.

NOTICE

TAKE NOTICE that the undersigned are prepared to supply at a reasonable price Rolling Mills for I-Girders, described in Canadian Patent No. 103,360, or to grant anyone a license to have the same manufactured for him at a manufacturing establishment in the Dominion of Canada. They are also prepared to receive offers for the purchase of the patent or for licenses to manufacture under the same. Ridout & Maybee, 59 Yonge Street, Toronto, attorneys for Hugo Sack.

You Can Do Better Work and More Work, and Can Minimize Your File Expense

By Using

"DELTA" FILES

This Has Been Proved Time And Time Again By Comparative Tests

TRADE MARK DELTA

"The only Line of Files from 3 to 24 inches that are made absolutely of CRUCIBLE STEEL"

DELTA FILES are made in all shapes and sizes, so as to meet every requirement. Ask your jobber to let you see them, pick out the kind most suitable to your business and **give them a trial.** If they do not come up to our claims you will get your money back. Cut represents our **PILLAR FILES** which are made in all sizes and cuts, Bastard, 2nd cut and Smooth from 3in. to 14in. The thickness is about one-half the width in proportion, making it a very useful file in filing out keyways and slots of all descriptions, the flat side having a good curve, making it a good file for die makers and for use on all special work.

Our trade mark, which is on every file, is your protection.

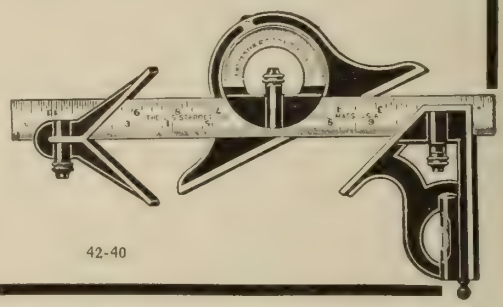
Starrett Tools

Insure Your Work Against the Scrap Heap



You believe in life insurance? Of course you do—Everybody does.

Do you not also believe in "scrap heap" insurance? Those machinists who do, and there are lots of 'em, never use cheap inaccurate measuring tools. They "insure their work" by using

Starrett
Instruments of Precision

Then, too, it doesn't cost much to keep up your Starrett "policy."
Perhaps one Starrett tool will do the work of many other tools and the one tool will cost less. For instance, the Starrett Combination Set does the work of a whole set of try squares, protractor, centre head, bevel, depth gage and rule.

It will pay you to look up the Starrett line in the catalogue No. 193. Yours for the asking.

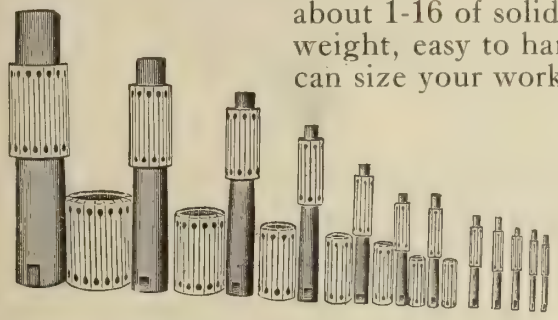
"Champion" Tool Holders



"The Holder with the b g head."

The "Champion" line is known wherever Tool Holders are used. They hold the cutting tool firmly and take the heaviest cuts on a planer, shaper or lathe without breaking—by reason of the patented support under cutting edge. They ensure the closest accuracy and maintain correct cutting angle. **Write for Booklet.**

"Champion" Expanding Mandrels

are suitable for all kinds of work and all kinds of metal—even the softest. Their cost is about 1-16 of solid mandrels of similar capacity. They are light in weight, easy to handle, remain true and fit the hole **completely.** You can size your work to one-thousandth of an inch, thus saving time time spent in hunting the right size in solid mandrels.

Maisonneuve THE "PITTSBURG OF CANADA"

FIGURES FOR THE MANUFACTURER

Why don't you build your factory in Maisonneuve, the city that takes first place in the value of its industrial productions per capita of the Dominion of Canada

Other manufacturers are finding it to their profit to remove their factory from places where competition is too keen for labor, where troubles exist, where shipping facilities are poor, and where they are otherwise handicapped, to Maisonneuve, the fastest growing industrial town in the Dominion

We take care of the manufacturer here, as well as of the workman. This makes for the peace and profit of both

Here are figures showing the value of the industrial production of the chief cities of the Dominion compiled by Mr A. Blue, statistician of the government, and given before the manufacturers' convention at Ottawa, Sept. 25, 1912

VALUE OF INDUSTRIAL PRODUCTION

Year 1910.

First, Montreal	$166,000,000.00
Second, Toronto	154,000,000.00
Third, Hamilton	55,000,000.00
Fourth, Winnipeg and St. Boniface	39,000.000.00
FIFTH, MAISONNEUVE	21,000,000.00
Sixth, Ottawa	20,000.000.00
Seventh, Quebec	17,000,000.00

PROVINCE OF QUEBEC

First, Montreal	$166,000,000.00
SECOND, MAISONNEUVE	21,000,000.00
Third, Quebec	17,000,000.00

IN THE DOMINION OF CANADA, PER CAPITA

Manufacturers should go to Guelph!

BECAUSE

It is right in the heart of busy Ontario, yet where the country is fertile, healthy and beautiful.
Manufacturers are encouraged, and sites are practically given away.
Labor is cheaper by 25 cents a day than in adjacent cities. The cost of living is low, and house rents halved.
Guelph is practically free from labor troubles, and the open shop is in vogue.
The Ontario Agricultural College is there, with its **Machinery Hall.**

ST. GEORGE'S SQUARE. GUELPH, ONT.

Why Seventy-five Firms have Factories in Guelph

It is a distributing centre for Hydro-Electric Power.
Has a splendid water-works system, with a capacity of 4,500,000 gallons per day.
It is the largest shipping and transhipping point on the main line of the G. T. R.
Is also on the Goderich Division of the C.P.R. Toronto and Windsor Division C.N.R.
Was the first Canadian Municipality to own and operate successfully all its public utilities.

Go to Guelph, Sir!

Write to R. McDONALD, Industrial Commissioner, City Hall GUELPH, ONT.

THE "LANCASHIRE"
ELECTRIC PLANER DRIVE

is not only the most efficient drive to have on your new tool, it is a drive which can easily be fitted to your existing planers. After conversion your planer will do 50 per cent. to 100 per cent. more work than it does now, whilst your power bill will be no larger. This we can prove by actual conversions made in this country.

On a new tool say 4 ft. x 4 ft. x 20 ft. it will enable you to have 20 cutting speeds from 15-50 ft. per minute, and a return speed of 150 ft. per minute. Can be used with either A.C. or D.C. supply.

WELDING

DON'T LOSE TIME

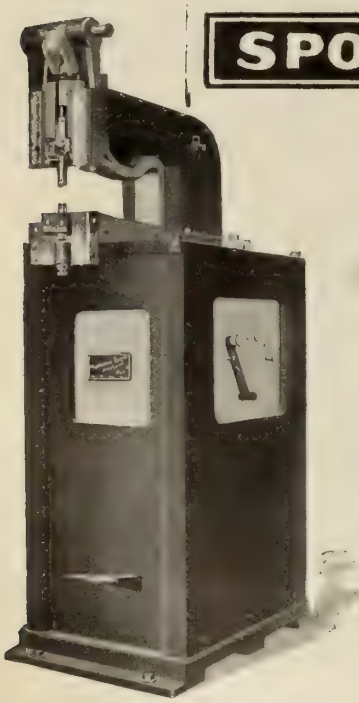
WE CAN WELD YOUR BREAKS

Every minute you lose through breakages means a loss of much time and money.

You cannot afford to hold up part for your plant for days while renewal parts are being made when we can, by our welding process, make the broken part as efficient as the original in a few hours at a reasonable cost.

When your next breakdown occurs, telephone or wire us. Our emergency repair outfit which is in charge of experts travels by express. We have night and day shifts for the benefit of our customers.

Nothing too large or too small for our capacity.



Send us some small broken part and test the quality of our work.

We sell and instal complete welding and cutting plans.

No. 20-D Spot Welder

SPOT and BUTT WELDING MACHINES

Of the Highest Electrical Efficiency

Which Will Do a Given Amount of Work with Less Current Than Any Other Machine of This Type

It is not merely a claim that our welders consume less current—it has been proved by actual tests.

We have good facilities for demonstrating this fact, and the intending purchaser who expects to use a considerable amount of electric current should investigate this feature.

We are the pioneer builders of **Electric Welders** in Canada, and we know our machines are equal, if not superior, in efficiency to any foreign make.

They are **strong, convenient, accessible, very durable**, and capable of producing the **highest quality work.**

Drop us a card for **descriptive booklet** to-day.

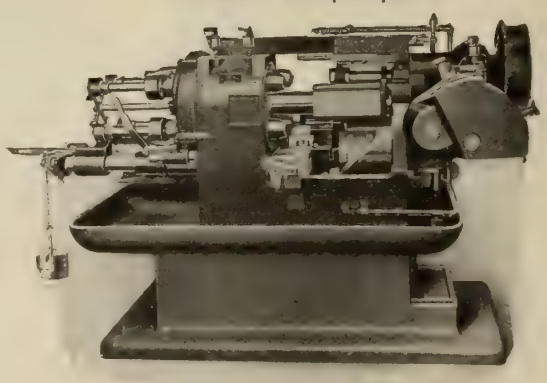
One Man Can Operate From 3 to 6

"GRIDLEY" AUTOMATIC TURRET LATHES

At Once—Hence a Great Saving in Labor Costs.



Besides this **greater accuracy** can be secured on **"GRIDLEY" Automatics**, because a stiffer and more efficient type of cutting tool can be used. **The tool is held rigid without overhang, and cannot spring or wobble.**

The type of tool and general design of these lathes **ensure a greater output**, as a heavier and coarser feed can be maintained. **For Rapid, Convenient and Economical Service, you cannot equal "GRIDLEY" Automatics.**

A trial will convince you that this claim has a sound foundation.

We manufacture both **Multiple and Single Spindle Automatics.**

"GRIDLEY" Muitiple Spindle

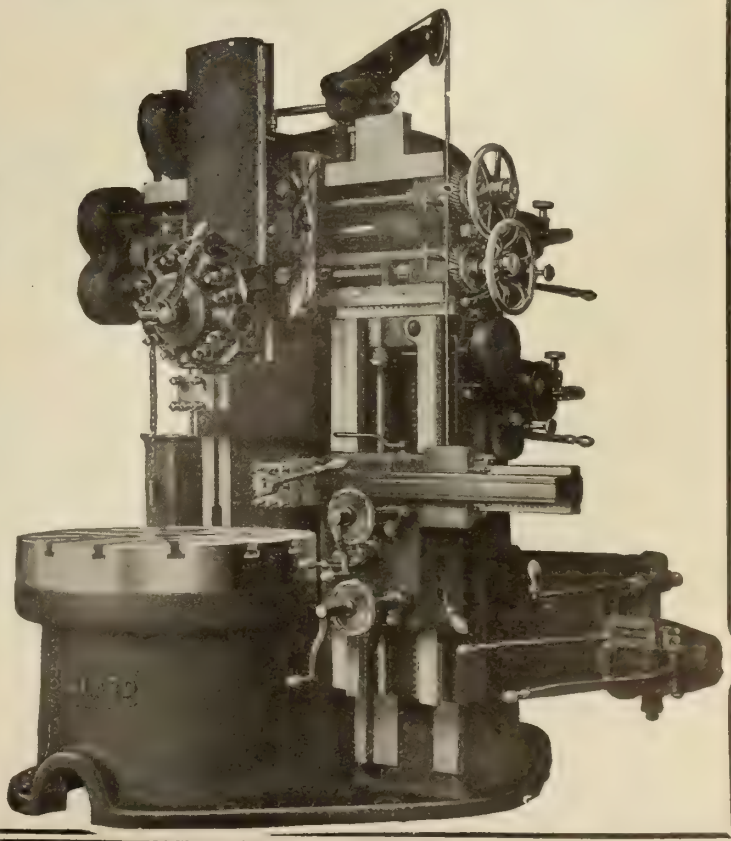
One Machine That Replaces Two Others and Does the Work of Either in Less Time

On all Face Plate Work Within Its Range



On all work within its range, the Vertical Turret Lathe replaces both the Vertical Boring and Turning Mill and the Horizontal Turning Lathe. It combines their good features. Thus it takes the place of either one of them with all the valuable features of the other added. But in combining the two, other features were developed which are exclusively the Vertical Turret Lathe's. Like a boring mill, it is heavy and rigid, capable of doing heavy cutting. Like the horizontal turret lathe, its turret provides a means of holding tools in instant readiness for a sequence of operations.

Unlike either of them, it has a Side Head for more tools, which can be brought into use simultaneously with those in the Main Head—Multi-cutting.

Unlike the horizontal machine, there is no overhang of the work—the alignment of table spindle is self-preserved.

Unlike the boring mill, the control is centralized—time-wasting steps are eliminated. The similarities show that the Vertical Turret Lathe does all the work within its range, as well as both these machines.

Let us send you our interesting Treatise on Face Plate Work C-15—Free. It has the details.

Rockford Gang Drills

Will Put The Operator's Time To The Most Productive Use

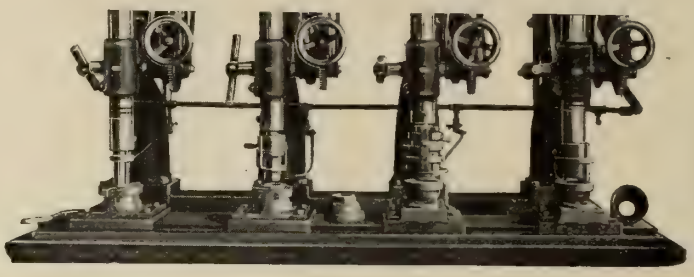

Illustration shows a four spindle 23-inch Gang Drill equipped with jigs for boring and reaming the hubs of Conveyor Pulleys. Dimensions of hubs 6 in. long for hubs 1 in. in diameter.
Operations: 3 spindles drilling; fourth spindle reaming. Material: cast iron.
One operator can produce, in a ten-hour day, 600 pulleys, or one per minute.
Rockford Gang Drills are really Vertical Lathes, but their value lies in their ability to use the operator's time to the greatest advantage.

THE ROCKFORD DRILLING MACHINE Co. ROCKFORD ILL. U.S.A.

By proper Jigging and Tooling and Gauging the number of spindles per operator, a Gang Drill can be made one of the most valuable machines in the shop.

Write for our FREE BOOKLET "**Jigging and Tooling,**" and learn more about **Rockford Gang Drills.**

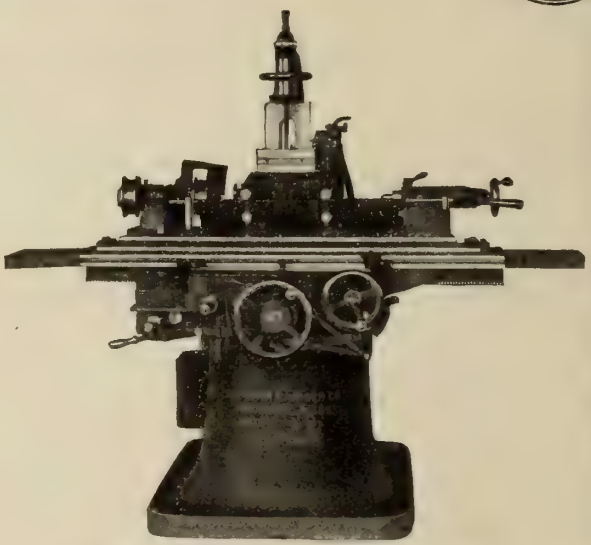
ROCKFORD DRILLING MACHINE CO., Rockford, Ill.

Why the Bath Universal Excels

BECAUSE it is the heaviest complete Universal Grinding Machine on the market.

BECAUSE in this machine is incorporated all the necessary features for performing the various grinding operations with as much rapidity and accuracy as could be accomplished on a single purpose machine.

BECAUSE the machine is so designed that the changing from one operation to another is reduced to a minimum.



BECAUSE the grinding wheel head does not swivel, *(has only a vertical movement)*, and is supported by a heavy wall of metal direct to the floor.

BECAUSE it has a powerful wheel drive.

BECAUSE the table can be stopped automatically at the end of its traverse by giving the reverse lever a part of a turn at any time during the traverse of the table.

BECAUSE the Bath Universal is easily arranged for External, Internal, Surface, Disc, Cutter and Reamer grinding of all descriptions.

"USEFUL HINTS ON GRINDING" — A booklet every grinding machine operator should have, its yours for the asking.

Bath Universal Grinding Machine arranged for cylindrical grinding.

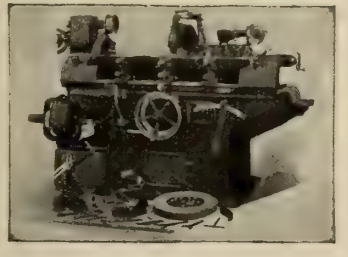
Five Spindle Vertical Nut Tapping Machine

If we simply stated that the capacity of this machine was 20,000 3/8 in. hot pressed square nuts per day, you would probably be a bit skeptical of our claims, but some of our customers are even exceeding this output on this size nuts—we have prima-facie evidence, and we believe that this is considerable better than any other hand operated machine is turning out.



Taps are held upright, eliminating chips dropping into nut holders and consequent loss of time in frequently cleaning these out.

May we send descriptive matter?

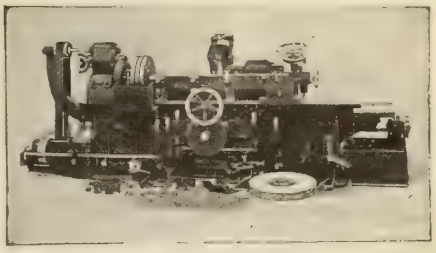
Box 1650. SPRINGFIELD, OHIO. U. S. A.

LANDIS PRECISION GRINDING MACHINES

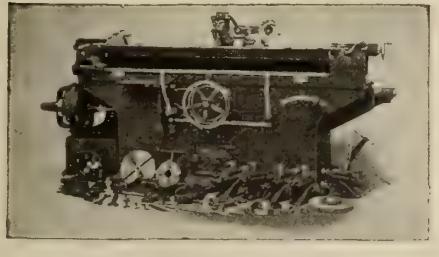
Landis Plain Grinding Machines.



10" x 30", 12 x 32", 12" x 42", 12" x 66", 12" x 96", 12" x 120", 16" x 72", 20" x 96", 20" x 120", 20" x 144", 20" x 168". These machines are intended for finishing straight and taper spindles, shafts, rolls, tubing and all other work within their range which can be revolved on dead centres.

Large Type.

Standard sizes: 20" x 96", 20" x 120", 20" x 144", 20" x 168".

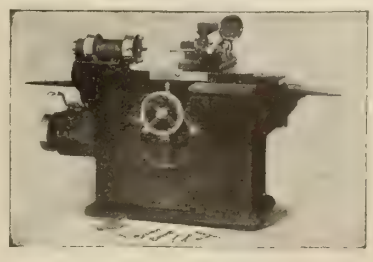


These manufacturing machines are adapted for straight and taper cylindrical shafts, spindles, pistons, corliss valves, plungers, tubing, and are especially desirable for grinding hardened steel and iron rolls.

Plain Grinding Machine with Gap.

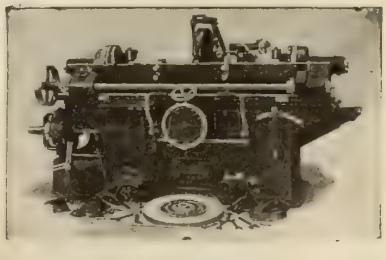
These are our 16" Plain Machines built with gap in the bed to suit the location of the projection on the work.

Largest exclusive manufacturers of grinding machines in the world.



Landis Universal Machines (Large Type).

No. 1 (10" x 20"), No. 1½ (10" x 30"), No. 2 (12" x 32"), No. 3 (12" x 42"), No. 4 (12" x 66").



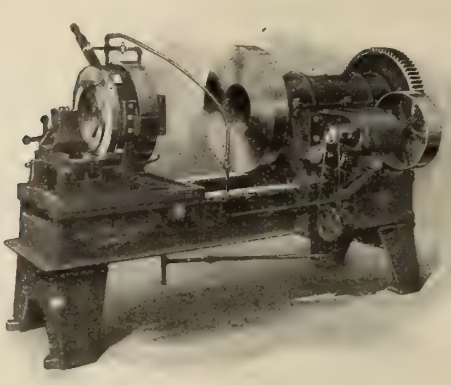
Nos. 2, 3, 4 (also built with 16" swing) are used for finishing tools and a variety of straight or taper parts (both external and internal) as are common to the toolroom, machine shop, railroad shop, etc.

Attachments such as magnetic chuck, gear cutter attachments, cam grinding attachment, side mill grinding attachment, etc., can be used on these machines.

Landis Internal Grinding Machines.

This machine is intended for straight and taper internal grinding. The fixtures for these machines will grind holes ¼" diameter or larger, and up to 12" long.

Landis Crank Grinding Machines.



These machines are designed for grinding single or multiple throw crank shafts used in gas and small steam engines.

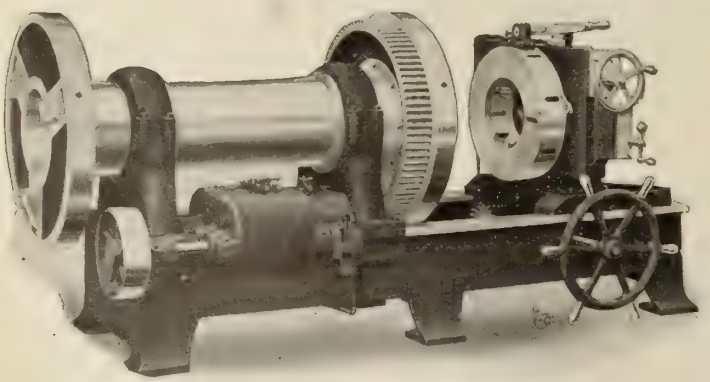
LANDIS TOOL CO.

WAYNESBORO: PENNA., U. S. A.

Canadian Agents
A. R. Williams Machinery Co., Toronto; Williams & Wilson, Montreal.

A Pipe Machine might be built that outwardly would resemble the Williams. But it would be a difficult matter to equal the superior quality and efficiency of the Williams Machine. These represent years of patient experiment with various metals and processes for tempering and hardening steel.

It is simply astonishing how slight a variation in the degree of hardness or angle of clearance seriously affects the cutting and lasting quality of pipe machine dies.



Why take chances? Why not have the machine that has been tried and tested in 1500 shops and not found wanting. Drop us a line stating capacity of machine in which you are interested.

WILLIAMS TOOL CO. Erie, Pa.

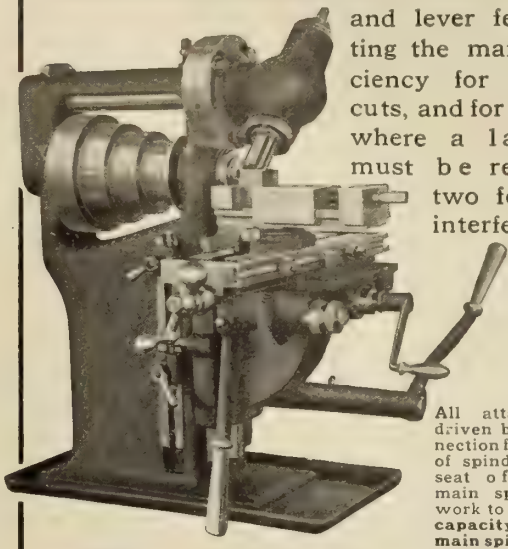
REDUCE METAL
WITHOUT WEAKENING IT

Our Book "The Modern Art of Swaging" sent free on request.

Swage The Dayton Way

The Dayton Swaging Machine does not sacrifice one particle of strength of the metal being reduced. From 2,000 to 6,000 taps per minute knead or squeeze all of the desirable quantities into the portion where its diameter is reduced. Thus the metal has added strength, solidity, rigidity, elasticity and uniformity. Swaging is far superior to rolling, grinding, milling, turning or drawing as a means of reduction of metal.

Send a sample of your work and we'll quote the saving by the "Layton" way.



Excelsior Needle Co.
Torrington, Conn., U.S.A.

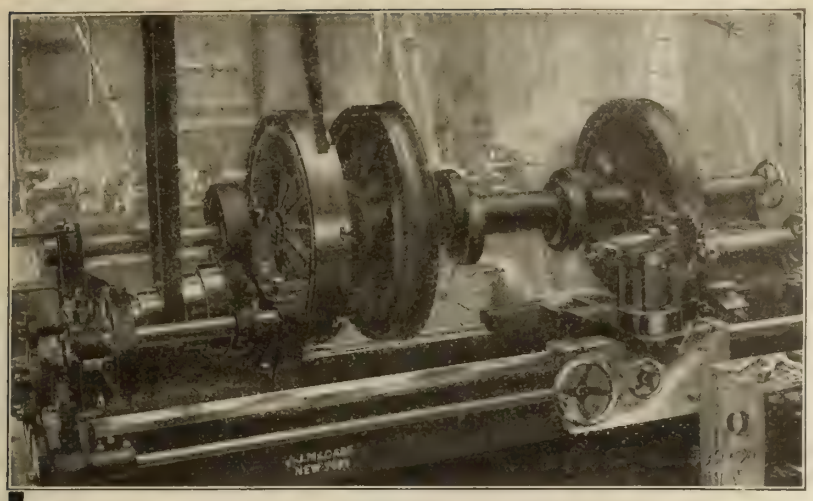
Does your shop enjoy the advantages of modern Besly Grinding Equipment?

If not, your competitor who is equipped has a great advantage over you by reason of his lower manufacturing costs.

Write now for a copy of 1912 Edition of Besly's Modern Disc Grinding Practice, a 112-page illustrated treatise, and

Study this Important Subject



Grinding Automobile Circulating Pump Covers, 3 x 5 inches.
Material, cast brass.
Area of each surface ground, about 15 square inches.
Stock removed, enough to clean up, about 1-64 inch.
Machine, No. 14-26 K Besly Grinder.
Workholder—Work is supported by the bosses on backs of covers, projecting into holes in angle plate. Angle plate is bolted to top of Geared Lever Feed Table.
Circle, No. 02340, Grain No. 36, Wide Ridge Helmet Spiral Circle.
Time, 480 pieces per hour.
Cost of circles, about 4 cents per hundred pieces.

Registered Trade-Mark

McCabe's "2-in-1" Double Spindle Lathe
26/48-in. Swing.

The Time not to make a mistake

is when you are going to buy that big Lathe.

You have big work—yes—but not enough.

McCabe's "2-in-1" Lathe checks idleness. When your big work "goes to the dogs" you can go to the 26-inch swing of the "2-in-1" Machine. This "2-in-1" Lathe has all that any two or three thousand dollar big Lathe offers—and a great deal more, at about half the price. To get down to details get the new book, now ready for distribution.

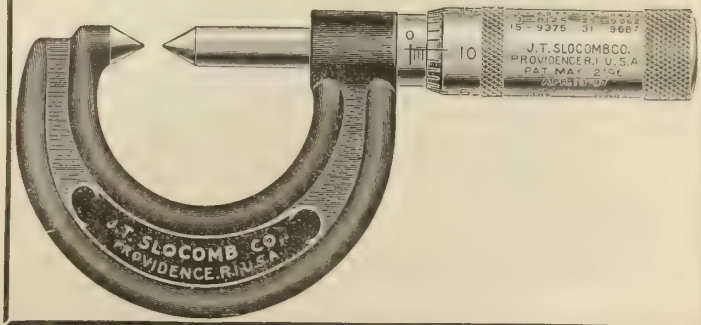
Micrometer Cases

are not generally of service for holding a micrometer when it is carried about. They have been too bulky. This new case that we are putting out is one that will fit in the pocket as conveniently as a pipe case. It is shaped much after the same idea.

No. 41 Case for 1-inch Micrometers

is only 5¼ inches long, and yet will hold the 1 in. micrometer and friction stop. It is covered with genuine Morocco leather and velvet lined. It is of advantage to keep your micrometer free from dirt, and this case enables you to do so and yet carry the tool in your pocket ready for use.



Be sure and send for one now, also our catalogue No. 13C.

"Bennis" New Link Chain Grate Stokers

Bennis Chain Grate Stokers
Bennis Coking Stokers

and Patented Self-Cleaning Compressed Air Furnaces for Water Tube and Horizontal Return Tubular Boilers

Bennis Machines are supplying over 3½ Million Horse Power and are saving Millions of Dollars a Year

"BENNIS" machines feed the fuel where the fire requires it, keep the fire at a nicely calculated distance from the boiler front and respond to varying loads with a rapidity that is the outcome of good design. They ensure the maximum results from the boilers, reduce the fuel bill, and keep clean chimneys because they ensure good combustion.

For Cheap Steam without Smoke from water-tube boilers instal "Bennis" Machine Stokers

"Bennis" stokers are not simply made from one design and adapted to meet the requirements of different types of boilers, but are especially designed for the various types, constructed with the greatest care and fitted to meet individual conditions.

The greatest economy is achieved when Bennis elevating and conveying plant feeds the stokers. "Bennis" coal and ash-handling plant has acknowledged advantages over other types, not only in design and construction, but in the small amount of power required to operate it effectually.

You Need the No. 19 Set "Cleveland" Combined Drills and Countersinks

Need it more than you realize—saves time monkeying around looking for that centre drill, gives you the exact size Drill and Countersink you want for the job—simply remove the cover and pick it out. All the sizes in common use, made up to the CLEVELAND standard of finest quality specially heat-treated reamer steel and milled so that the chips from the drill point are not clogged by the chips from the countersink. These tools are backed by our 38 years experience of small tool making — look for your guarantee, the CLEVELAND ◈ trade mark.

A Place for Each Size, and Each Size in its Place.

Accompanying Illustration shows exact size.

No. 19 set is an inexpensive time-saver, brought out to fill the demand among machinists everywhere for such a set. The tools are contained in a polished hardwood box with screw cover, convenient in size for the tool box or pocket.

Circular No. 33-C sent upon your request.

Your Dealer will be Glad to Show You No. 19—Try it.

PREMIER DIE STOCKS

Work so easily that a novice can operate them.

Thread Pipe 1 to 2 Inch Right and 1 to 2 Inch Left With One Set of Dies

¶ The main principles of the "Premier" are that it not only starts itself on the pipe, but automatically throws itself out after a "Briggs" Standard Thread is cut instead of backing off, which spoils the Dies.

¶ The trouble with leader screws and nuts is a thing of the past. The new patented off-set Die, which can be used only in the "Premier," has overcome the difficulties. The Die is made in such a way, that once over the pipe, it accomplishes what any other make of Die would in going over twice, as one set of teeth are much lower than the other, consequently every tooth does an equal amount of work.

¶ The "Premier" will cut straight and running lock nut threads, and will thread a 5½ inch nipple at both ends without the use of a nipple holder.

¶ No separate bushing or dies to carry around and lose. The "Premier" has but one lock and that is used only when changing from one side to another. The centering device has a scroll cam, without locks, which operates the three jaws that guide the die stock on pipe.

Send for further information.

"Beaver" Adjustable Die Stocks

¶ Each stock contains a set of dies which can be used to cut four different threads—a twist of the wrist sets the size.

¶ The service-giving qualities of the "Beaver" have enabled it to become a good friend of every user.

EMERY CORUNDUM WHEELS

"Brantford Wheels are good Wheels"

If you want the best grinding results
use
BRANTFORD WHEELS

Made from the best natural and artificial abrasives known. To your Order in any size or shape in either Vitrified or Silicate wire webbed.

Brantford Emery Wheel Co., Limited
Brantford, Ontario, Canada

The Shop Foreman Says:
"The Efficiency of Carborundum Wheels is So High That There is No Chance of Comparison with Other Wheels."

Sixteen twenty-four-inch Carborundum wheels now do all the rough work in a big Eastern New York railroad shop—work that the men once did with the file and chisel.—The same wheels are used for general tool grinding.—They save hours of time—do the work cleaner and truer—give the results that prompted the shop foreman to make the statement as above.

Truly the wheel that pays is—the right wheel in the right place.

Locomotive Shop Tool Room Milling

requires massive universal milling machines like that shown in the cut. **All B. & S. Heavy Universal Machines** are well adapted to this class of work, for they are exceptionally rigid and capable of producing accurate work under every practical condition. In addition they are economical and handy to operate — points of value to both owner and mechanic.

Special circulars of any machine gladly furnished.

YOU WANT TO IMPROVE YOUR POSITION

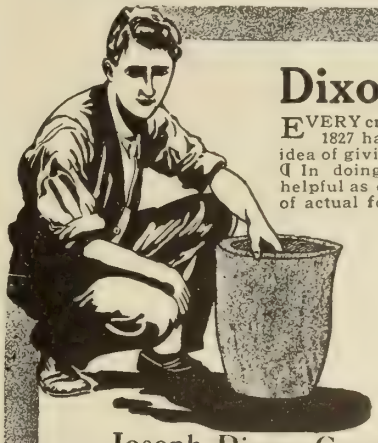
THEN READ THE

LIFE OF JAMES WATT

INVENTOR OF THE STEAM ENGINE

By ANDREW CARNEGIE

An entertaining book for those interested in mechanics and power, dealing with the scientific and mechanical inventions of Watt's life and times and his relations with other noted scientists and inventors.



The author, as a practical engineer, possesses all the technical knowledge necessary to give actuality to his writing, and his book is alive with enthusiasm and appreciation. He has missed no point in the romance of Watt's career, with its many thrilling episodes and its study of human nature revealed in a realistic manner. Mr. Carnegie may not point out how to become a millionaire, but he certainly sets forth considerations which may help to influence many a working man to improve his position.

Cloth Bound. 164 Pages. Postpaid, $1.00.

Dixon Crucibles

EVERY crucible made by DIXON since 1827 has been made with the one idea of giving reliable service.

¶ In doing this nothing has been so helpful as our experience and our study of actual foundry conditions. ¶ In the purchase of raw material, in mixing it correctly, in spinning up the crucible, wherever there has been any question our experience has been called upon to give the final answer.

¶ Write for our booklet No. 223-A on the care and use of crucibles.

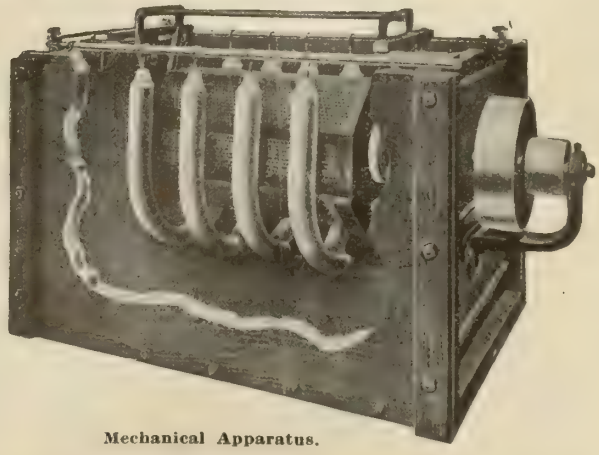
Electro-Plating Apparatus and Materials

GENERAL FOUNDRY EQUIPMENT



We manufacture all classes of plating supplies in Toronto. Prompt shipments.

Buffs	Carbonate of Zinc
Buffing Compositions	Cyanide of Potassium
Copper Anodes	Cyanide of Sodium
Brass Anodes	Pumice Stone
Zinc Anodes	Pure Turkish Emery and Glue
Nickel Anodes	Canvas Wheels
Polishing Wheels	Sheepskin Wheels
Nickel Salts, Double	Felt Wheels
Nickel Salts, Single	Bull Neck Wheels
Nickel Salts, Black	Brass Wire Wheels
Carbonate of Copper	

Kostico Better than Potash or Caustic Sodas. For preparing work for Plating.

Pickelene Takes the place of acid Pickles. Dry salt, no Injurious Fumes.

Electro Chemical Cleaning Salts

For Sale by Supply Houses.

SEND FOR THIS FREE BOOK

You May Have This Book Without Spending a Cent

if you are a subscriber to "Canadian Foundryman," by sending in to us four new paid-up subscriptions. If you are not a subscriber send in your own, along with the proper number of paid-up subscriptions and the book is yours.

Foundry Work

By Wm. C. Stimpson

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

Price, $1.00

Given free with four yearly paid-up subscriptions.

The subscription price is fifty cents per year; two years for one dollar.

Canadian Foundryman

143-149 University Avenue, Toronto

All Sizes, 1-4 lb. to 30,000 lbs.

We make new process converter steel castings, annealed and unannealed.

We also make Chrome Manganese and Nickel Steel Castings.

On the Defensive!

There are times when the Foundryman is on the defensive.

It is when the tiger of competition is too self-assertive.

In the reduction of costs a new profit is created.

Stevens' Pure Plumbago reduces cost

One New York Foundryman writes:—

"Your Lead gives me the best peeled castings I have had for a long time, and the color is right, too."

That means that this Lead does the work expected in the Foundry instead of leaving it for the scratch-room or the chipping room to finish.

That means labor saving and cost saving.

Each shipment has its return ticket—it may be returned and freight paid by me both ways when not satisfactory.

The entire risk is on me!

Its use squelches all tiger danger.

I manufacture the entire line of **Foundry Facings and Foundry Supplies**, and the quality stamp impresses them all.

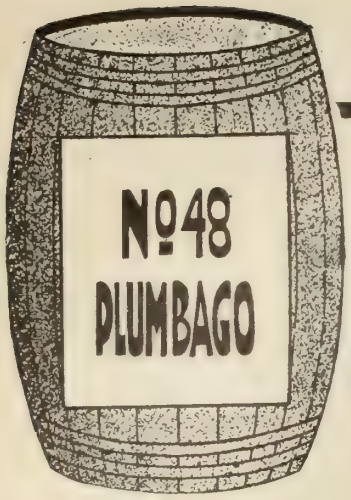
CRANES

All Types---For Every Service

Complete Foundry Plants



We make a specialty of complete foundry plants for any class of castings — grey iron brass, car wheel, pipe, steel (O. H. and converter), or malleable. We prepare layouts showing location of all machinery, furnish and install equipment, and conduct initial operation, relieving the customer of all risk. Send for our complete catalogue. Information gladly furnished.

Cupolas	Core Oven Cars	Furnaces (Brass, Malleable & O. H.)	Tramrail systems
Tumblers	Elevators		Turntables
Trucks	Air Hoists	Annealing Ovens	Sand Sifters.
Ladles, Core Ovens	Converters

The Detroit Foundry Supply Co.

DETROIT, MICH. Foundry Supplies, Platers' and Polishers' Supplies. WINDSOR, ONT.

A GOLD MINE

SAVE YOUR IRON

SLY'S PATENT IRON CINDER MILL
Patented, No. 514097. Patented, No. 841728.

may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the iron contained in your cupola dump and gangway scrapings and 75% of the coke. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

We also manufacture Cleaning Mills, Dust Arresters, Sand Blast and Foundry Equipment.

Nova Scotia Steel and Coal Company, Ltd.

BEGS TO ANNOUNCE

That their new Steam-hydraulic Forge Shop is now in operation, as also is their recently installed "Harmet" Fluid Compression Plant.

These improvements bring "Scotia's" Equipment abreast of the best foreign forges.

They are accordingly open to supply forgings of all shapes and sizes, made of Best Ordinary or Fluid Compressed Open-hearth Steel, and satisfying the most severe specifications.

The Daily Grind

The daily grind of mechanics engaged in using abrasive wheels is made much more effective if their machines are fitted with

CANADIAN HART CORUNDUM WHEELS

Our wheels are free and fast cutting, porous, safe, and very durable. Send for our catalogue which describes the various processes used in making Canadian Hart Corundum and Emery Wheels.

CANADIAN HART WHEELS, LIMITED
Hamilton, - - - - Ontario

"Dominion" Emery Wheels

We use only the very best emery and artificial abrasives on the market, which, when combined with a special bond of our own originating, enables us to produce a wheel which **we guarantee in every particular.**

Our wheels are not pressed or tamped in the least, but are mixed, and while in a plastic state are poured into forms. When partly dried they are shaved or cut from the solid into shape and size desired, thus insuring a **very open, porous** and **free cutting** wheel.

Our wheels are graded to suit every requirement.

They cannot be excelled in durability.

This Lathe Means Productive Efficiency

DO YOU know what your lathe work costs? Do you know the proportion of dead time consumed in adjustments and changes, as against cutting time, when your lathes are actually producing work?

The McDougall Quick-Change Gap Lathe is a speed machine in every sense of the term. It has the strength and perfect construction of headstock and rest that permit high cutting speed without chattering. It has swift get-at-able tailstock adjustment bolts. It has easy-reading micrometer adjustment for the cross slide.

These things mean efficiency. A battery of these lathes in your establishment will relieve congestion. They will permit increased output. The McDougall is one of the most dependable and substantial pieces of equipment you can buy. We will make it with wide, deep gap, and in any length of bed, and you will have absolutely no trouble from springing.

What are your lathe needs?

Write us with full particulars.

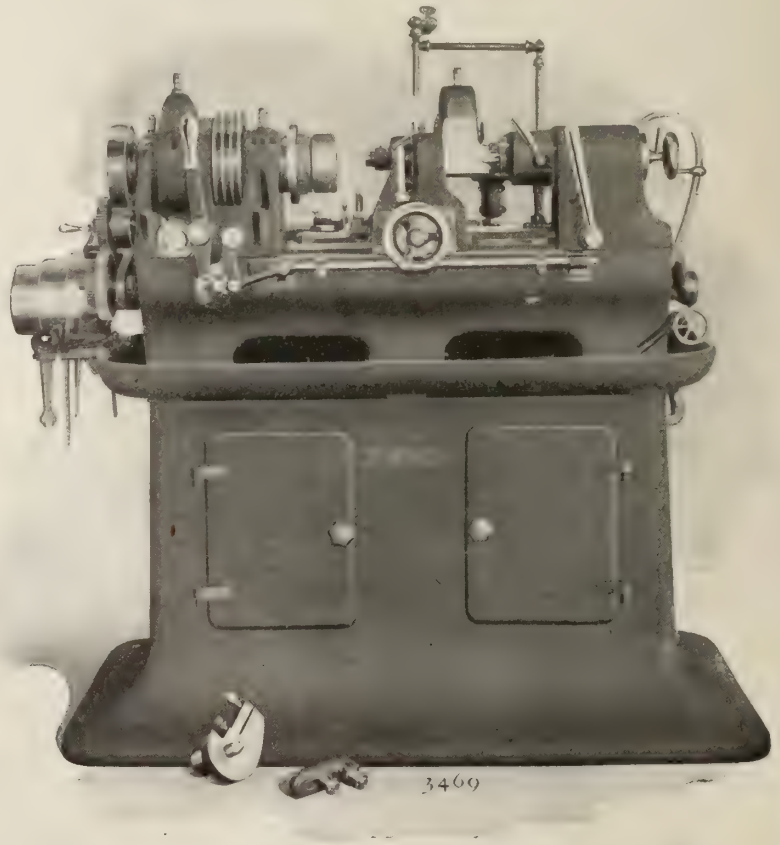
Why Not Mill Your Auto Steering Worms?

Single and double thread worms cut on P. & W. Thread Milling Machine.

It has been proved that the most rapid, accurate and efficient method is by means of

P. & W. Thread Milling Machines



The efficiency of these machines on this class of work is being demonstrated in many of the largest automobile factories.

One Man Can Operate Several Machines

The automatic features of the P. & W. Thread Milling Machine enables one man to keep several machines busy, which makes possible a very large output.

Smooth, Accurate Threads at one Cut

The rigidity of the design and accuracy with which these machines are built and aligned, gives a smooth, accurate thread at one cut.
Inquiries covering your requirements solicited.

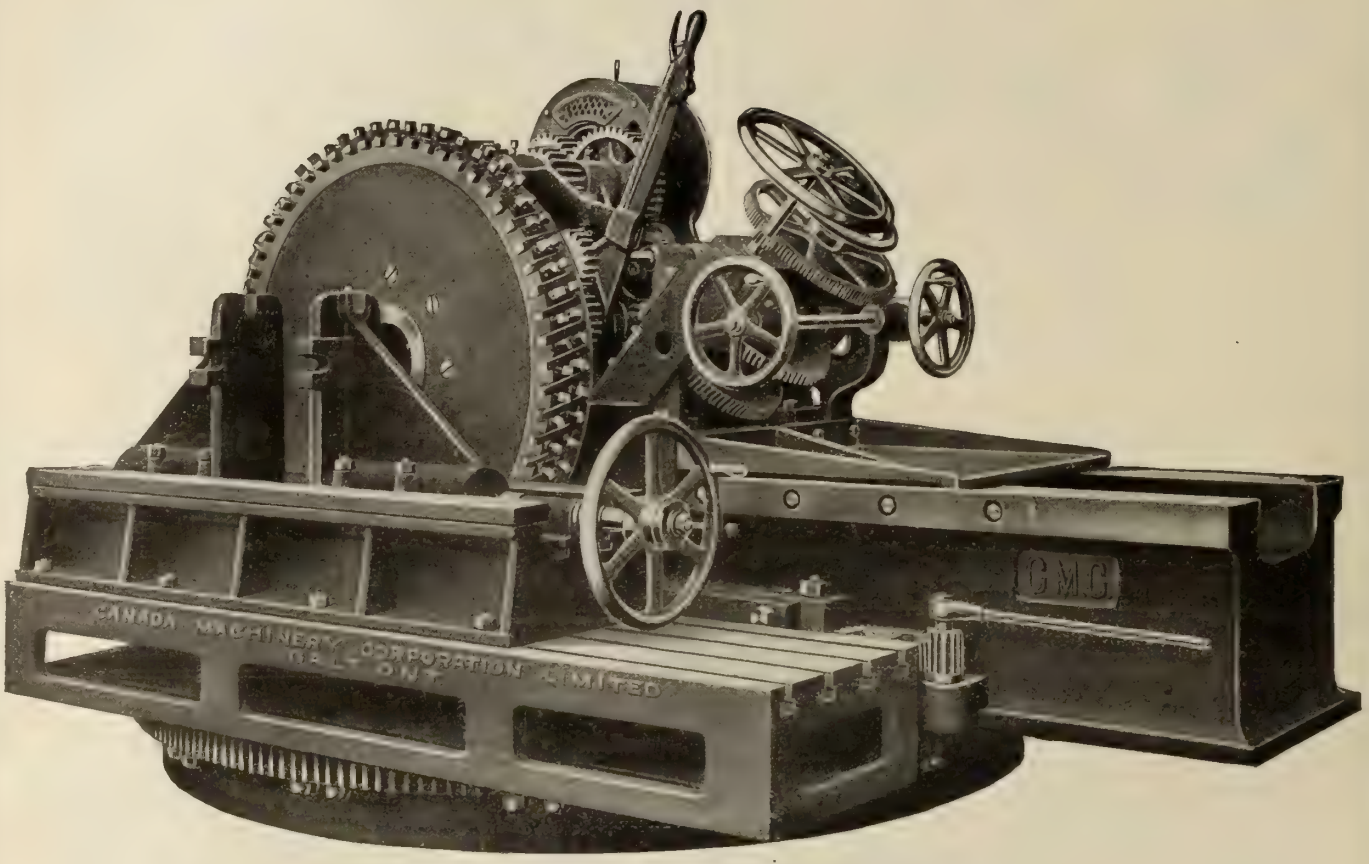
NORMAN MacDONALD, 145 Wellington St., TORONTO

Westinghouse Type CCL Induction Motors form the reliable drive for constant speed machine tool drive.

AFTER Westinghouse Type CCL Motors are properly installed, the only attention they require is an occasional cleaning, inspection and lubrication. Beyond this there is nothing to be done.

They are ready to start any moment, and keep the machines they drive in continuous operation until the power is shut off. Their life is very long; some of the first Westinghouse Motors are still in successful operation.



Of course, like other machines, these motors must be properly installed. Westinghouse Service takes care of this detail by giving full information on the application of Westinghouse Motors to any machine or tool.

A big Lathe—till you're finished —then a small Lathe

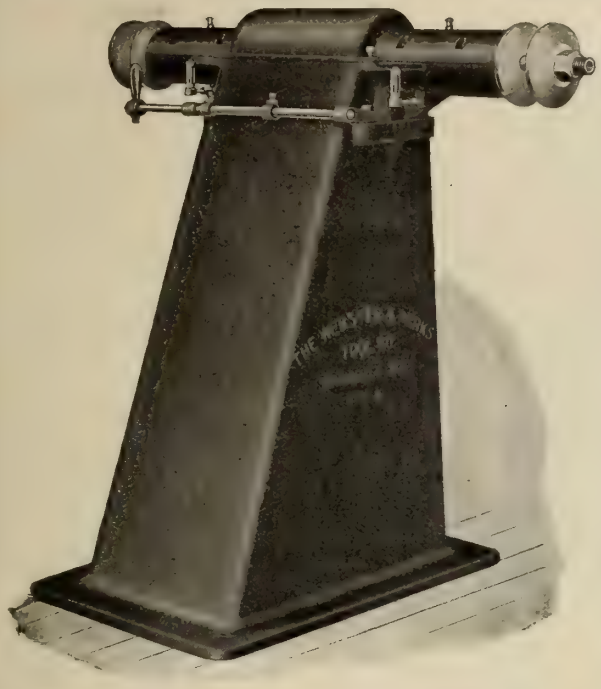
McCabe's "2-in-1" Double Spindle Lathe 26/48-in. Swing.

McCABE'S LATHE is built on an idea—**TWO LATHES IN ONE.** And this idea has appealed to thousands of shops who wanted a big Lathe,—

TO GO WHEN IT'S STANDING STILL (Handles small work when there's nothing big).

What's more to the point—see one in operation—there's absolutely no improvement when it's a question of getting capacity and service for little money.

McCABE'S "2-in-1" is the most you can get in any Lathe.



J. J. McCABE

The Double Spindle Lathe Man.

30 Church St., New York

The advertiser would like to know where you saw his advertisement—tell him.

New Heavy Ball-Bearing Polishing and Buffing Lathe

Friction consumes power and power costs money

It is a well known fact that ordinary polishing lathes consume excessive power, due largely to the friction caused by the style of bearings employed, to eliminate which we have recently designed two sizes of Ball Bearing machines.

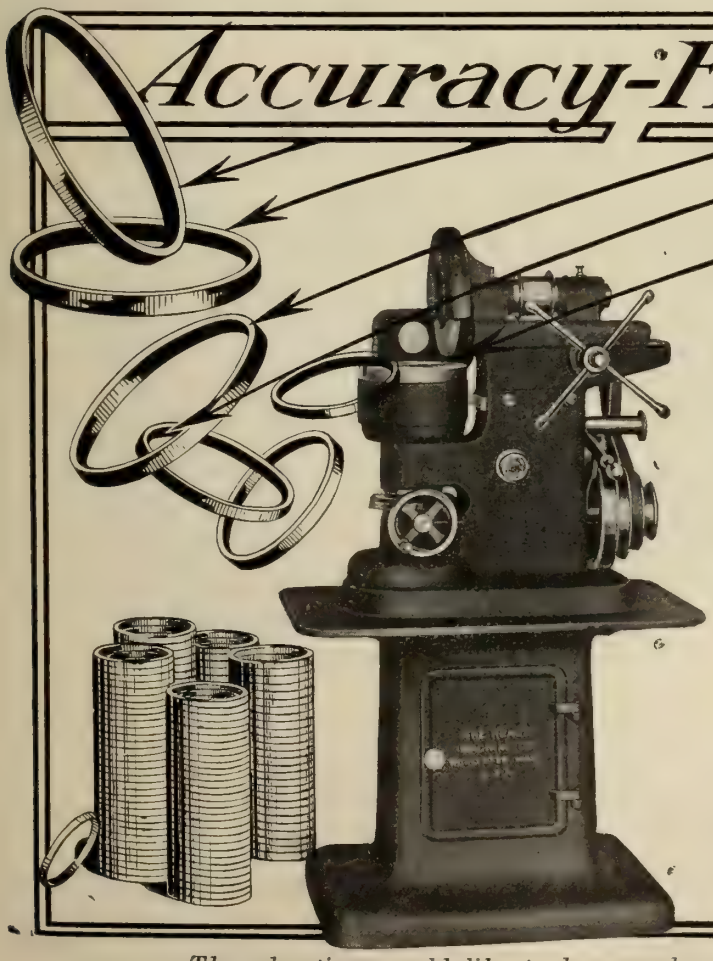


Illustration shows our Heavy No. 6 Machine, fitted with (4) S.K.F. Double Row Self-aligning Ball Bearings, has tight and loose pulleys on spindle for 6 in. width of belt. may be either belted from above or below and in the latter case pulley covers are provided as shown, preventing belts carrying dust and lint.

Machine weighs 650 pounds, and we believe is the most rigid, substantial, best built and longest lived polishing lathe made to-day by any manufacturer.

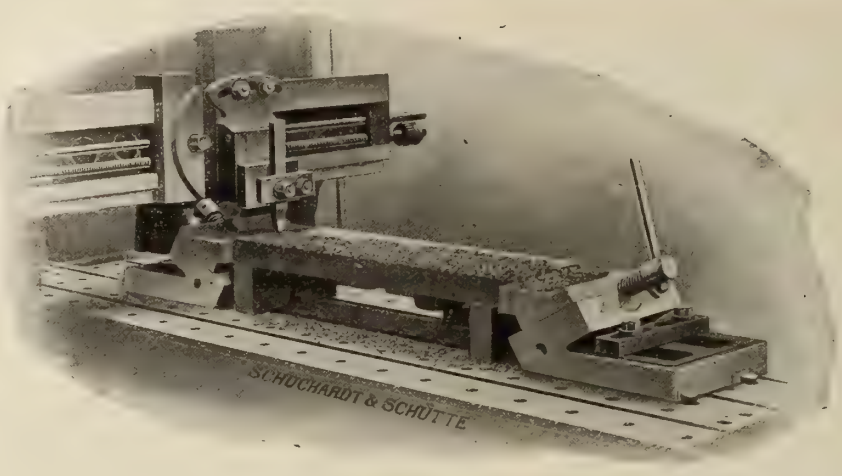
If you are interested in reducing your polishing room power costs, write and ask us for circular "C" of the above.

The Webster & Perks Tool Co., Springfield, Ohio

Accuracy-Finish-Speed

OVER 800 4" PISTON RINGS Ground in 10 Hrs.

And every one accurately and beautifully finished.
This output has often been obtained on the HEALD PISTON RING GRINDER without sacrificing quality for quantity.



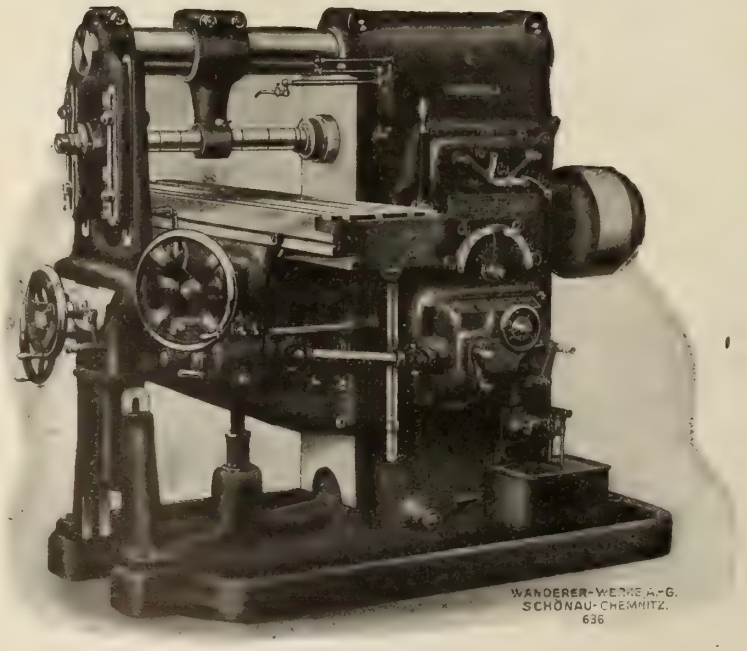
The Heald Machine Company

8 New Bond St., WORCESTER, MASS.

The advertiser would like to know where you saw his advertisement—tell him.

S & S Divided Machine Vises

Will hold work up to full length of table on which they are used.



Will Clamp the heaviest work as well as the lightest.

The Combined Parallel and downward movement of the jaw forces the jaw down to the table, saves the operator the use of a hammer, which with ordinary Vise is necessary to insure work being properly bedded to its supports. Price is less than ordinary Vise. Made in three sizes.

Write for special catalogue.

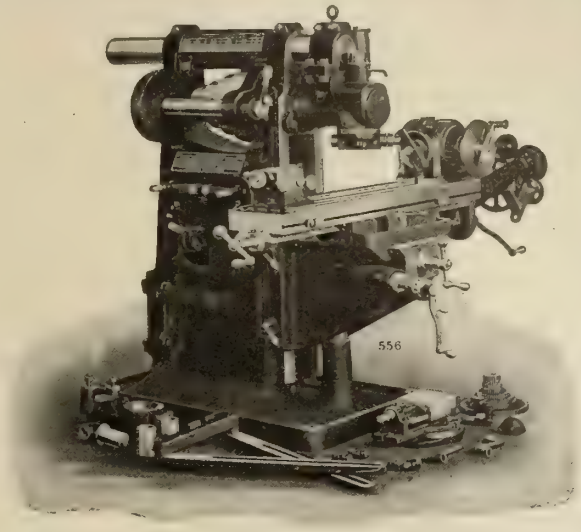
Wanderer Milling Machines

are unsurpassed for modern design—first-class material—accuracy and output; over three thousand in use; they are built with single pulley drive and cone drive.

WANDERER WORKS

Formerly Winklhofer & Jaenicke, Ltd. SCHOENAU NEAR CHEMNITZ, GERMANY

The advertiser would like to know where you saw his advertisement—tell him.



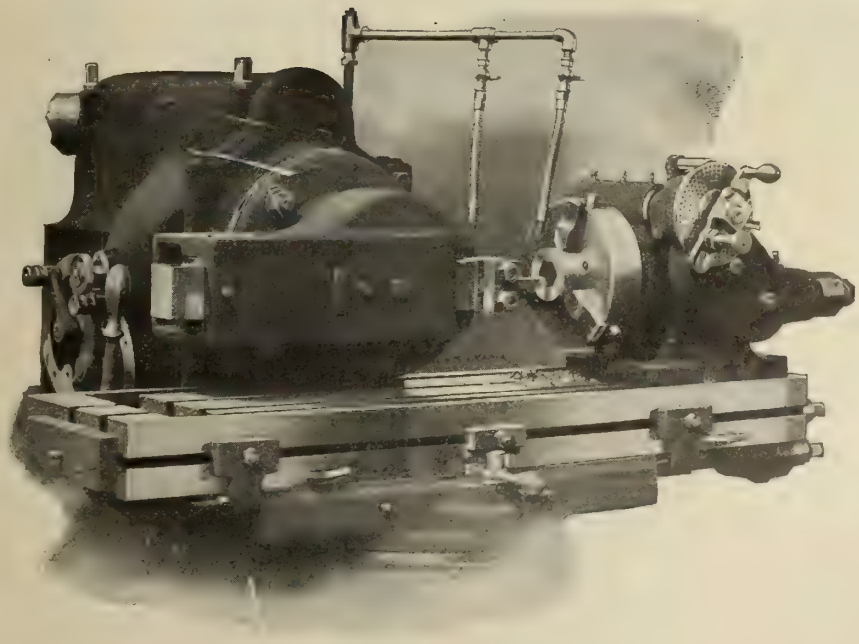
How Much Of The Time Are Your Universal Millers Used For Cutting Spirals?

A PLAIN MILLER fitted with index Centres can do any tool room job that a Universal can do except cut spirals,

Cincinnati Plain Millers can also cut spirals.

The equipment consists of Dividing Head, Driving Mechanism and Spiral Milling Attachment, and will cut spirals of greater angle than any Universal will take in.

But spiral jobs are only occasional, anyhow.



THEN why not install a Plain Miller with Dividing Head for your tool room work, and when a spiral job comes along, use the attachment?

This makes the ideal tool room outfit—a Plain Miller for the regular work and a spiral cutting equipment when needed for the occasional job.

In a Cincinnati Plain Miller with tool room equipment you have both a Plain and a Universal—two machines in one.

The Cincinnati Milling Machine Co., Cincinnati, Ohio, U.S.A.

CANADIAN AGENT: H. W. Petrie, Limited, Toronto, Montreal and Vancouver.

EVERY tool room should have a Milwaukee Universal Milling Machine, every universal milling machine should have a slotting attachment and every tool room foreman should have our latest book—to be had for the asking,

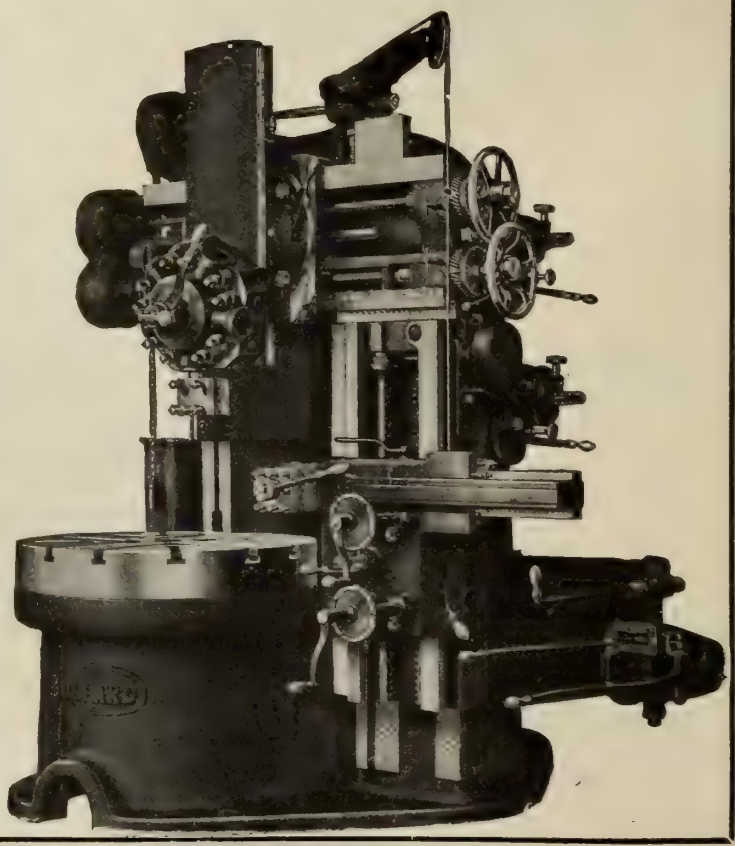
SCHUMACHER & BOYE

Engine Lathes **Cincinnati, Ohio, U. S. A.**

One Machine That Replaces Two Others and Does the Work of Either in Less Time

On all Face Plate Work Within Its Range



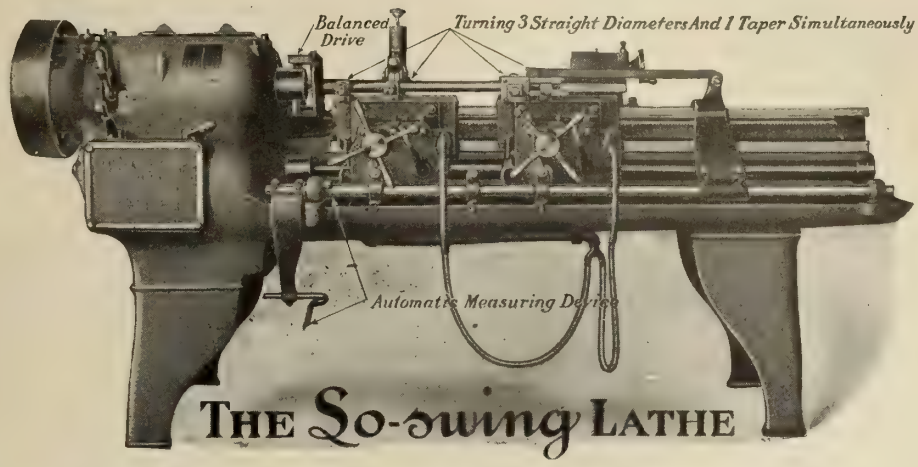
On all work within its range, the Vertical Turret Lathe replaces both the Vertical Boring and Turning Mill and the Horizontal Turning Lathe. It combines their good features. Thus it takes the place of either one of them with all the valuable features of the other added. But in combining the two, other features were developed which are exclusively the Vertical Turret Lathe's. Like a boring mill, it is heavy and rigid, capable of doing heavy cutting. Like the horizontal turret lathe, its turret provides a means of holding tools in instant readiness for a sequence of operations.

Unlike either of them, it has a Side Head for more tools, which can be brought into use simultaneously with those in the Main Head—Multi-cutting.

Unlike the horizontal machine, there is no overhang of the work—the alignment of table spindle is self-preserved.

Unlike the boring mill, the control is centralized—time-wasting steps are eliminated. The similarities show that the Vertical Turret Lathe does all the work within its range, as well as both these machines.

Let us send you our interesting Treatise on Face Plate Work C-15—Free. It has the details.



The Bullard Machine Tool Co.

BRIDGEPORT, CONN., U.S.A.

"The So-swing Lathe"

Saves from 3 to 5 Operations

The Only Machine That Turns Taper Cuts and all Parallel Cuts on a Shaft Simultaneously

The **So-swing Lathe** has a multiple tool outfit for turning several shoulders and taper cuts simultaneously, while the other tools may be set for shoulder work, oil grooves, or any special operation on any part of a shaft at the same time.

It has been proved in most cases that a job that takes two hours on an engine lathe, can be turned out in twenty minutes by the **So-swing**

Do your shaft work on a shaft-making machine — **So-swing Lathes** are fitted for this work, and will increase production and reduce operating cost.

Let us send you detailed information at once. An excellent opportunity to increase profits may result.

Ask us for **latest circular matter** and **blue print book** on multiple tool turning.

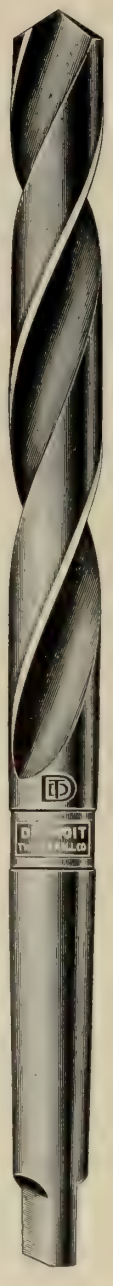
"Can't you get those castings off that drill press quicker?"



TRADE MARK

—"It's *time* that costs us, man!" The Superintendent who said that, struck the heart of the shop-costs question.

When *big* drill presses are tied up waiting for *small* drills to bore the holes, a lot of your money is not producing *all* that it should.

Wouldn't you save all through if your drills bored *more* holes in one hour?

These small tools can make your *big* ones more profitable.

"Detroit" Twist Drills

move castings *quicker*. They save time on *every* job. This means more work on the *same* machines for the day's output. Comparative tests have *proved* that they give the highest drilling efficiency regardless of material or conditions.

True to size they drill smoothly through the thickest metals the greatest number of times without regrinding.

And there's a "Detroit" Drill the exact size to bore a hole any given diameter. No variation—not a hundredth, not even a five-hundredth part of an inch is permitted.

In fact, "Detroit" Drills are ground to the *one two-thousandth* part of an inch. And they are ground *after* hardening, with the drills proved on their centres.

"Detroit" Drills will enable you to cut from 8 to 30 inches more metal per grinding. Isn't it worth your while to TRY them?

Catalog "R" shows a comprehensive list of both Carbon and High Speed Drills—one in black, the other in red for ready reference.

Write for it.

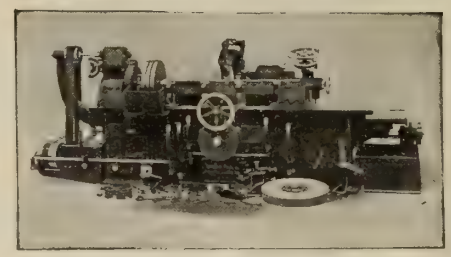
LANDIS PRECISION GRINDING MACHINES

Landis Plain Grinding Machines.



10" x 30", 12 x 32", 12" x 42", 12" x 66", 12" x 96", 12" x 120", 16" x 72", 20" x 96", 20" x 120", 20" x 144", 20" x 168". These machines are intended for finishing straight and taper spindles, shafts, rolls, tubing and all other work within their range which can be revolved on dead centres.

Large Type.

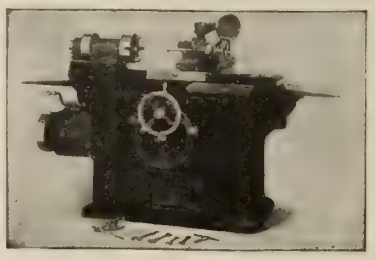
Standard sizes: 20" x 96", 20" x 120", 20" x 144", 20" x 168".

These manufacturing machines are adapted for straight and taper cylindrical shafts, spindles, pistons, corliss valves, plungers, tubing, and are especially desirable for grinding hardened steel and iron rolls.

Plain Grinding Machine with Gap.

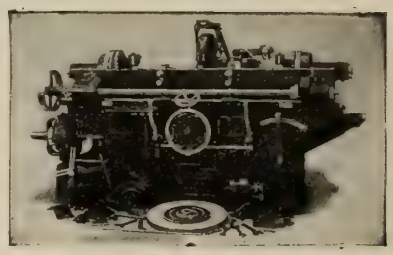
These are our 16" Plain Machines built with gap in the bed to suit the location of the projection on the work.

Largest exclusive manufacturers of grinding machines in the world.



Landis Universal Machines (Large Type).

No. 1 (10" x 20"), No. 1½ (10" x 30"), No. 2 (12" x 32"), No. 3 (12" x 42"), No. 4 (12" x 66").



Nos. 2, 3, 4 (also built with 16" swing) are used for finishing tools and a variety of straight or taper parts (both external and internal) as are common to the toolroom, machine shop, railroad shop, etc.

Attachments such as magnetic chuck, gear cutter attachments, cam grinding attachment, side mill grinding attachment, etc., can be used on these machines.

Landis Internal Grinding Machines.

This machine is intended for straight and taper internal grinding. The fixtures for these machines will grind holes ¼" diameter or larger, and up to 12" long.

Landis Crank Grinding Machines.

These machines are designed for grinding single or multiple throw crank shafts used in gas and small steam engines.

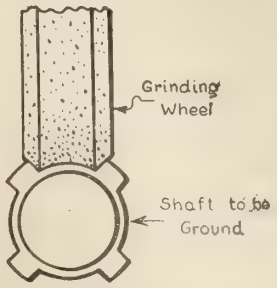
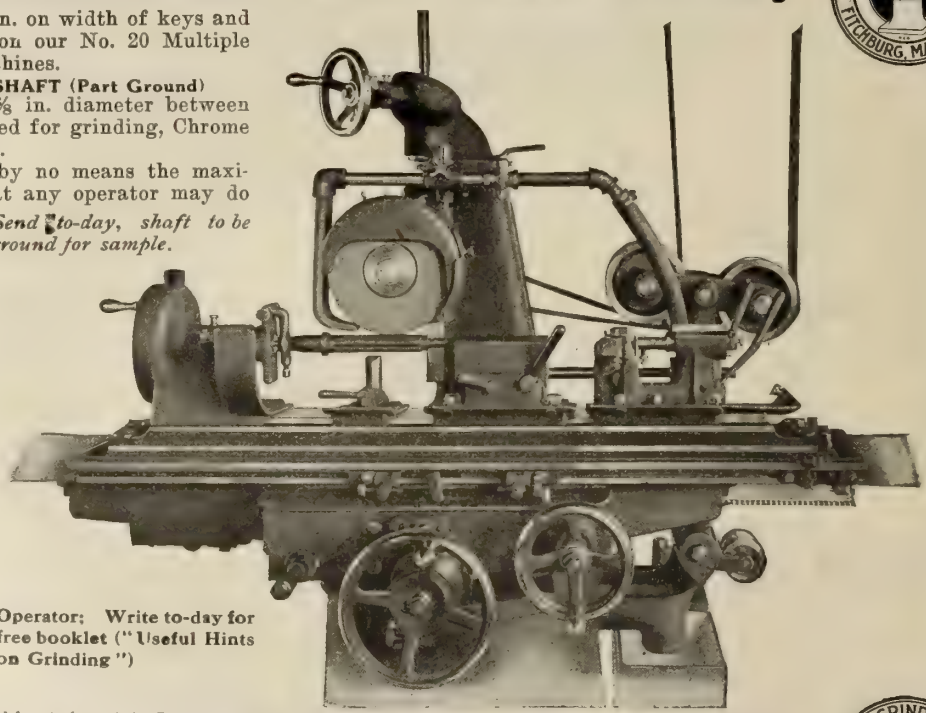
50 Automobile Main Drive Shafts A Day



with a limit of a .00025 in. on width of keys and radius between, ground on our No. 20 Multiple Key Shaft Grinding Machines.

SPECIFICATIONS OF SHAFT (Part Ground)

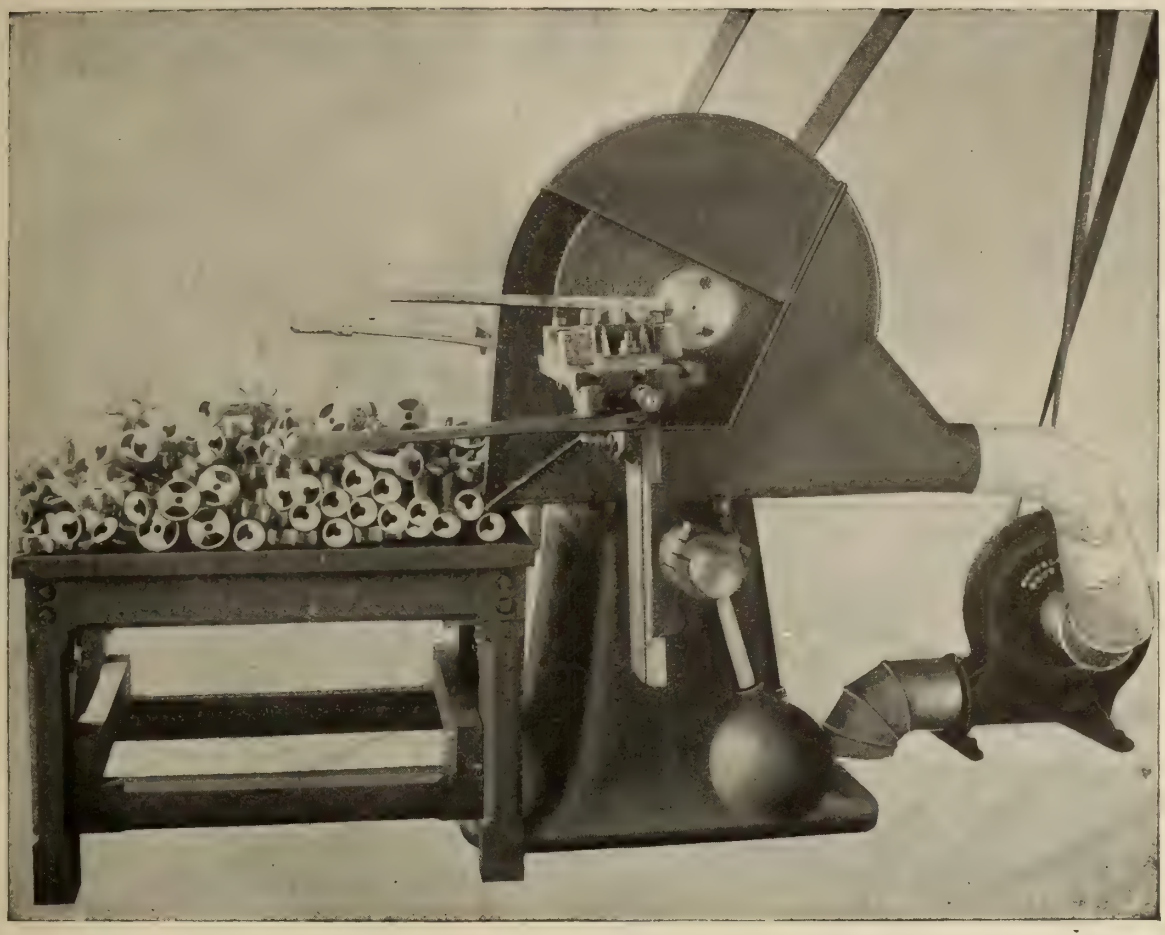


4 key, 6⅛ in. long, 1⅜ in. diameter between keys, 1-64 in. stock allowed for grinding, Chrome nickel steel, heat treated.

The number given is by no means the maximum. It represents what any operator may do with a little practice.

Send to-day, shaft to be ground for sample.

The above cut illustrates the formed grinding wheel applied to work. The side of two keys and radius between are ground simultaneously.



Operator: Write to-day for free booklet ("Useful Hints on Grinding")

Partial front view of the Bath 20 Multiple Key Shaft Grinding Machine and shows wheel acting on work

BATH GRINDER COMPANY, FITCHBURG, Mass., U. S. A.

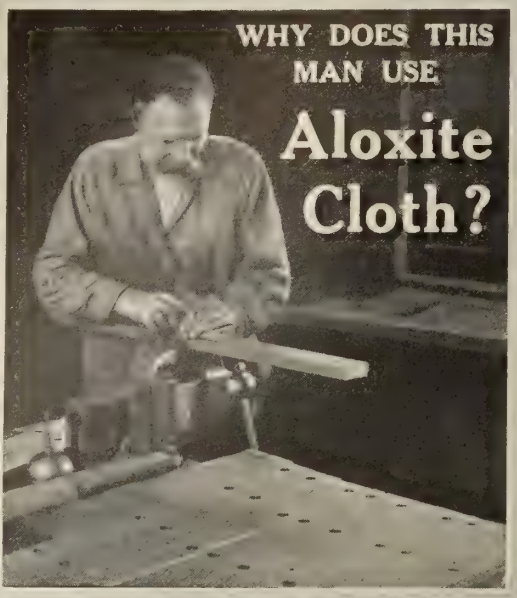
Canadian Representative—A. R. Williams Machinery Co., Ltd., Toronto

Doing It The Right Way
At the Rate of 210 per Hour

Here is a good example of manufacturing economy, brought about by substituting an improved Gardner Disc Grinder for the old-time methods. This particular illustration represents an increased output of 5 to 1, and a fifty per cent. better job than was accomplished by former machining process.

You know what a gas burner is as used on the ordinary gas range for cooking. It is merely required to face off the circular ends of these pieces straight and clean for an air adjusting cap. A very simple fixture, mounted on our Lever Feed Table, holds the piece while being ground. With unskilled labor these pieces are Gardner Ground at the rate of 210 per hour.

We do not claim Gardner Grinders will do everything, but we do claim there are innumerable pieces now being finished on shapers, milling machines, lathes, planers and precision grinders, that can be Gardner Ground with equal or superior accuracy, 3 to 30 times faster than they can be finished on the machines above mentioned.



Make us prove this statement by grinding some of your samples—free of charge. Our free 26-page Booklet of Tests contains much valuable data.

Gardner Machine Company

The Disc Grinding Authorities

BELOIT **WISCONSIN**

The advertiser would like to know *where you saw his advertisement—tell him.*

THE answer is the results he gets.—He is rubbing down cast-iron ram slides for shapers—the finish must be almost mirror like.—He is using Aloxite Cloth because it gives him just the finish he desires—because it cuts clean and quick—shows long life—the grain stays on and the cloth does not fill readily.

Aloxite Cloth is the cloth that cuts.—It is far superior to ordinary emery cloth—cuts faster—gives a better finish—lasts longer.

All good reasons why it should be used in your plant—on any work. Supplied in reams, sheets or the handy economy rolls.

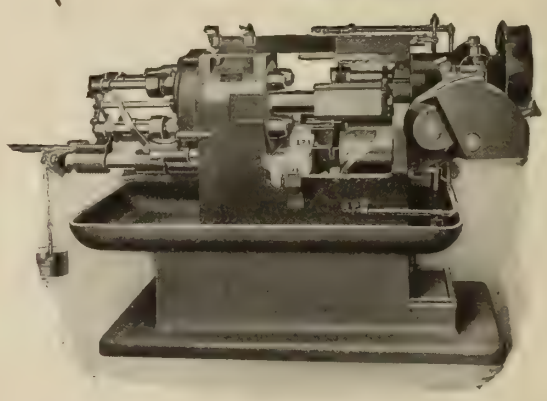
GRIDLEY AUTOMATIC TURRET LATHES

Can Be Operated RIGHT By ONE Man

The general design of these lathes and the type of tool used are the **assurance of greater output with absolute accuracy.**

Tools are held rigid without overhang — it is impossible for them to spring or wabble.



The "Gridley" handles work of greater length and of more complex character than any other lathe of this type.

Tools can be used tandem on each machine when rapid production is necessary.

We manufacture both multiple spindle and single spindle automatics.

Write for our illustrated catalogue to-day.

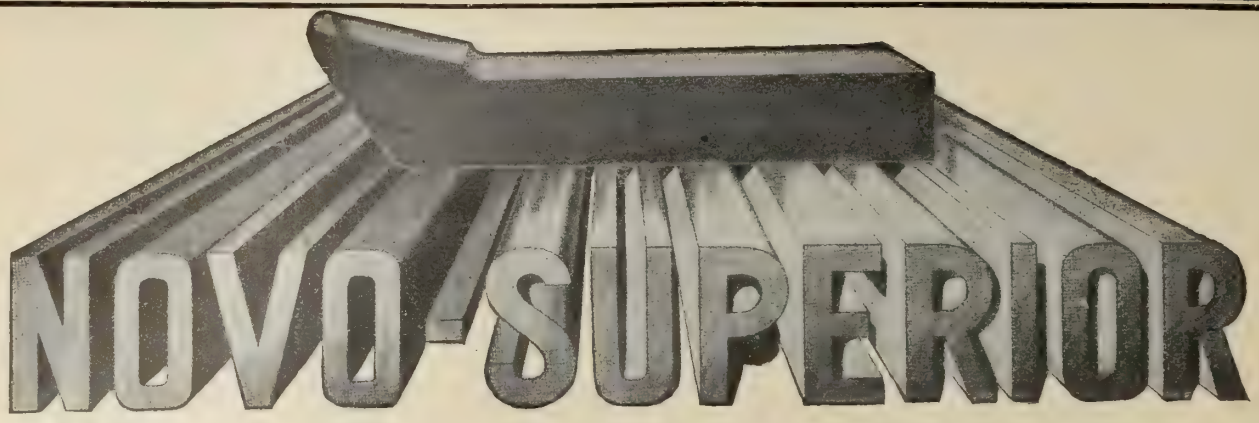
Geometric Adjustable Hollow Milling Tool

The Only Practical Hollow Milling Tool on the Market

Especially designed for Brass Finishing. Most serviceable and economical for reducing duplicate parts to an exact diameter prior to threading. Can also be used for light cutting on cast iron, steel or similar material. Not recommended, however, in place of roughing or finishing box tools for general screw machine work.

Extremely simple and durable. Easily adjusted. The cutters project beyond the face of the cam so as to permit of milling right up to a shoulder, where necessary.

We are prepared to furnish various styles of Geometric Adjustable Hollow Milling Tools, as well as special tools of this class to meet special working conditions.



Our Standard Hollow Milling Tools are furnished in sizes from 7-16 in. to 4 in. inclusive. Send us a sample of correct blue print of the work you wish to do, and we will submit quotations promptly.

INVESTIGATE OUR TOOLS, AND YOU WILL NOT BE DISAPPOINTED.

High Speed Steel Has a Solid Foundation In a Name That Means Something

Cutting speed attained on cast iron: Roughing cut, 140 ft. per minute—finishing cut, 210 ft. per minute.

In NOVO SUPERIOR you secure a materially increased speed over the high speed steels now in use, the highest quality, greatest toughness, longest life (3 times that of any other) and exceptional ability to cut very hard materials. The cutting edge retains its sharpness from 3 to 4 times longer than other high speed steels. Hardens in oil, air or water, and is now carried in stock in our warehouse in all current sizes, flat, squares and rounds; annealed and unannealed.

BIGNALL & KEELER MFG. CO.

EDWARDSVILLE, ILL.

SQUARE END BEAVER PIPE CUTTER

One Set of Knives. No Changing.

Cuts The Pipe Off Clean and Square—Leaves No Burr to Ream Out Or File Off

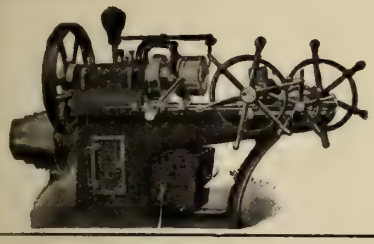
The "Beaver" Preserves the full inside Pipe opening. It makes a square pipe end on which threading dies start easier, last longer and run straight. It cannot split pipe.

It will cut off a piece of a threaded end right where it is threaded.

It works easier and quicker than a wheel cutter, and saves the extra time of reaming.

It is not strained by feeding too fast because you do not feed it—simply close it up on the pipe. The feed is automatic—simply pull, two handles, same as a die stock. The form of the knives regulate the depth of the cut. These are the features which make the Beaver Knife Cutter a successful, practical tool. The ordinary user does not cut enough pipe in a year to dull the knives.

The largest users of Pipe have discarded wheel cutters in favor of "Beaver" Square-End Pipe Cutters, as all will do who try them.



Done With Ordinary Pipe Cutter.

Cut With "Beaver" Square End Pipe Cutter.

REDUCE METAL
WITHOUT WEAKENING IT

Our Book "The Modern Art of Swaging" sent free on request.

Swage The Dayton Way

The Dayton Swaging Machine does not sacrifice one particle of strength of the metal being reduced. From 2,000 to 6,000 taps per minute knead or squeeze all of the desirable quantities into the portion where its diameter is reduced. Thus the metal has added strength, solidity, rigidity, elasticity and uniformity. Swaging is far superior to rolling, grinding, milling, turning or drawing as a means of reduction of metal.

Send a sample of your work and we'll quote the saving by the "Layton" way.

Excelsior Needle Co.
Torrington, Conn., U.S.A.

THE TAYLOR & FENN COMPANY

HARTFORD, CONN., U.S.A.

"The Mueller for Mine"

The Standard Type Mueller is especially adapted for shops where the work requires a high priced Radial Drill. We also build Simple Type Radial Drills for those whose work does not require our Standard Type Drill.

We wouldn't turn out a drill at any price if it wasn't good enough to be labeled "Mueller."

Mueller Radial Drill

is the **only** radial drill having a patented stationary column. This column is one of the most valuable features of our drill, because it prevents springing of the arm when the drill is under severe strain, eliminates all vibration, and enables you to do the heaviest class of work, in the shortest possible time.

It is one whole piece, and reinforced by four internal webs extending from top to bottom, and is finished by grinding, making it very accurate.

Radial Drills and Lathes

Cincinnati, Ohio

No. 3

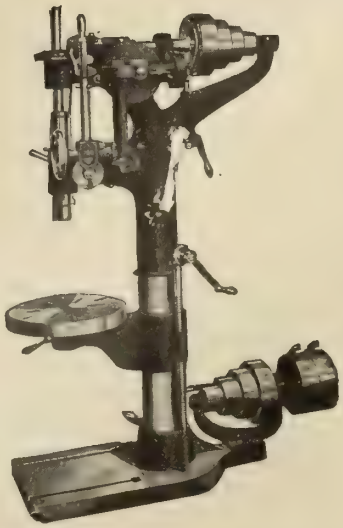
Rockford Hand Miller

With Vertical Attachment

is adapted for both horizontal and vertical milling; a wide range of work for slotting, and is fitted with the latest improved attachments for special work.

ROCKFORD HAND MILLERS have a combination screw and lever feed, permitting maximum efficiency for light, rapid cuts, and for heavy work where a large stock must be removed the two feeds do not interfere, and a change from one to the other can be instantly made.

All attachments being driven by a geared connection from the back end of spindle and bolted to seat of column above main spindle, permits work to be done to full capacity of machine, and main spindle and attachments can be operated simultaneously.



Full particulars on request.

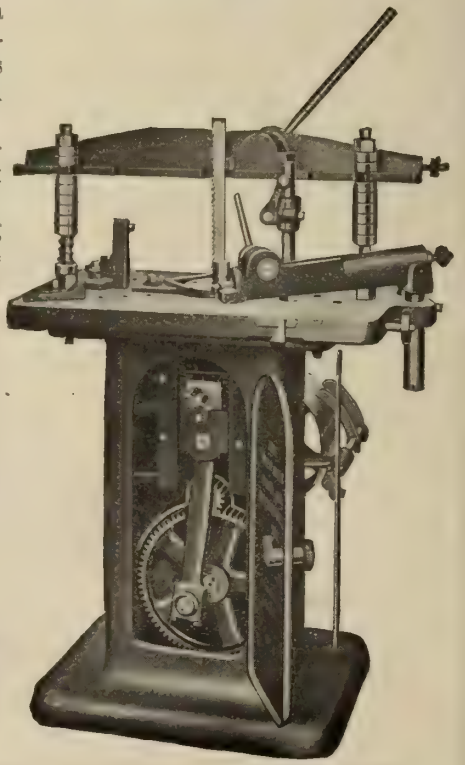
Keyseater and Slotter

Will cut keyseats, internal gears, internal ratchets, oil grooves, miscellaneous slotting, etc., more accurate and quicker than any machine on the market.



Baker Brothers, Toledo, Ohio.

Keyseating on the Davis

It becomes a simple operation as well as accurate and economical.

The feed is governed by a rack and pinion in the clamping arm and can be quickly set for rapid and accurate duplication. You can move the cutter so that its centre will cut the centre of the work without moving or readjusting the piece after it is once set.

A catalogue giving full details will be sent on request. A postal will do.

Send for Treatise on Key-seating—mailed free on request.

Leaky Transmission Eats Up Production

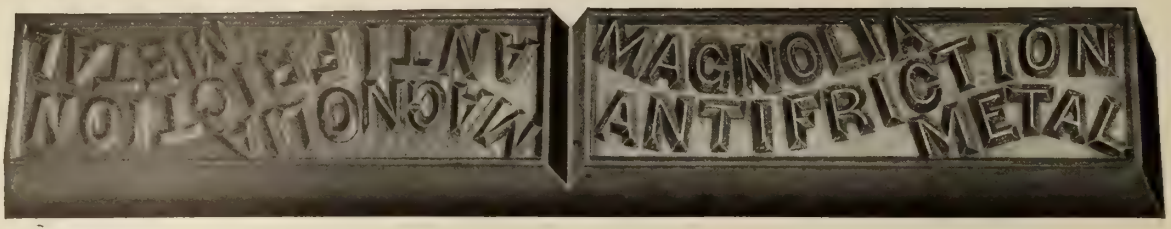
What is your possible production? Pretty hard to say. Maybe 10 per cent. more than your best record, but that is only guess work. It is a proven fact that a complete system of

MORSE Silent Chain Drives

transmitting power to all of your machines would *increase the possible production of your shop 10 to 20 per cent.*

When you figure the great saving of power, less wear and tear on machinery, less attention required and other features, the first cost of Morse Silent Chain Drives compares favorably to the first cost of any other leader in its field. *Their final cost is much less than for any other system of transmitting power.*

Let the two-pin "rocker-joint" be your guide to greatest economy and biggest production.



It's the joint of least friction, least attention and highest efficiency.

Can be had ONLY in Morse Silent Chains.

Morse Chain Company, Ithaca, N. Y.

A 56

HOISTING ENGINES

Dust and grit and uneven strain and exposure, combine to make the wear and tear on the bearings of Hoisting Engines very severe. The following letters indicate that Magnolia Metal is well suited for that service.

April 6th, 1911.

Gentlemen:—

I have used your Magnolia Anti-Friction Metal on *hoisting* engines of the following makes, Ligerwood, Mundy, Lambert, Mead, Morrison, Dela Vergne and National, and think that *it can't be beat.* I have run these engines *three years without re-babbitting the shafts* and those contracting firms certainly work these engines for all they are worth. Sometimes they start in at six in the morning and work until six at night.

Yours respectfully,
Leonard J. Hill,
160 Eagle Street,
Brooklyn, N.Y.

Chicago, Ill., 4-21-11.

Gentlemen:—

I have used considerable of your babbit metal and have found it very valuable. I have followed Hoisting and Portable work exclusively. It is a well known fact that engines of this type receive a great deal more use than Stationary engines do, because we move quite often, and in most cases our engines are exposed to all kinds of weather conditions, and all our boxes are exposed to sand, cement, stone, dust and all other kinds of matter, and I have found that Magnolia Metal has always given the best results. I am representing the Street Paving Engineers of Chicago and vicinity, branch of local 69, International Union of Steam Engineers, and I personally know that most of our members use your Babbitt Metal, because it gives the best results.

Faithfully yours,
Matt Keefe,
820 W. 57th St.

GEARS

Cut this out,—more coming each month.

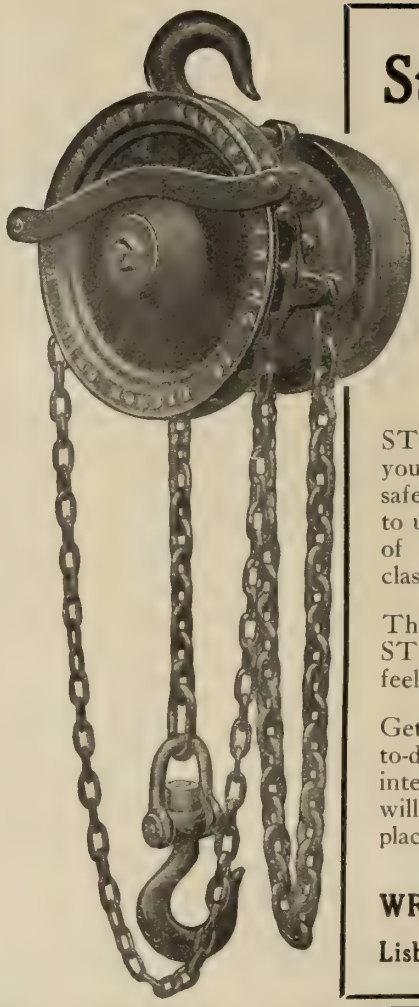
GEAR DATA
FOR
YOUR NOTE BOOK

Bevel Gears—Rules and Definitions
from The HAMILTON GEAR & MACHINE CO., Toronto

Relations of **Pitch Diameter, Pitch of Teeth** and **Number of Teeth** same as for Spur Gears.

Outside Diameter is Pitch Diameter added to Diametral Increment. This latter may be got from table (to follow), or worked out thus:—

Diametral Increment equals double the cosine of pitch angle divided by the diametral pitch. Figure separately for gear and for pinion. (See table of sines and cosines.)



Pitch Angle is found from a table of Tangents. The number of teeth in a gear (or pinion) divided by the number of teeth in its mate gives the Tangent of the Pitch Angle.

Face Angle is Pitch Angle added to Addendum Angle.

Addendum Angle is found from tables of Sines and Tangents. Twice the sine of pitch angle divided by the number of teeth gives the Tangent of Addendum Angle.

No. 3A Universal Milling Machine

The Constant Speed Drive Enables You to Pull Heavy Cuts

The constant speed drive type of milling machine was originated at the shops of the Brown & Sharpe Mfg. Co., and placed upon the market by them. The fundamental principle of this type of machine is a single pulley or motor running at a constant speed, from which develop features that are distinctly advantageous in modern milling machine practice.

Brown and Sharpe

on a Milling Machine is just as much of a guarantee to you as the name "Sterling" on silver. You can depend upon a B. & S. Machine to accomplish what is claimed for it. A glance at the above illustration will show the lines and proportions of the machine as a whole, the heavy and massive frame, the large and rigid base, the vertical depth of table, saddle and knee, the rigid arm brace and arbor support, and the accessibility of all hand wheels and levers for controlling the various movements.

Any standard constant speed motor can be employed on this machine. The drive is direct from the countershaft to the machine driving pulley, which is of large diameter and runs at a constant speed.

Capacity of this machine is, longitudinal feed, 30 in.; transverse feed, 10 in.; vertical feed, 19 in.; all feeds automatic.

Write to our nearest branch for special circular containing full description and specifications of the B. & S. No. 3 Universal Milling Machine.

The George White & Sons Company, London, Ontario

Staff Article

A description of the works of an old established firm building threshing machinery, traction engines, etc. The plant has been gradually built up to its present size, the foundry being the latest addition. The company maintain two branches in the West and have agencies in all the principal cities and towns in the grain growing districts of Canada.

THE George White & Sons Co., Ltd., are well known as makers of high-class portable traction and stationary engines and grain threshing machinery; and their outfits may be found in all parts of the prairie provinces and also Eastern Canada. They have a fine plant at London, Ont., and large warehouses at Brandon, Man., and Moose Jaw, Sask. The firm has grown up from small beginnings, having been founded by Mr. Geo. White, Sr., who came to Canada from Devonshire, England, in 1856, with practically no capital at his command. He settled in London, Ont., and immediately secured land at what is now 71-76 King St. East, for which he had to give a mortgage. Mr. White here commenced the building of wagons, buggies and light agricultural machinery. A few years later he took up the manufacture of small stationary engines and boilers and, as time went on, developed a portable engine for threshing purposes.

The business at King Street continued to extend, and in 1890 the patterns, templets and goodwill of the McPherson Mfg. Co., of Fingal, Ont., for the manufacture of grain threshing machinery, were purchased. This gave a fresh impetus to the business which continued to steadily increase during the next ten or twelve years, in which period Mr. Geo. White gradually took his numerous family of sons into the business with him.

By 1904, the company found themselves very much cramped in their King Street premises and it became necessary to move to more spacious quarters. A suitable site was secured in the eastern part of the city, alongside the Grand Trunk Railway tracks. Here the nucleus of a large engineering works was at once erected and has been gradually added to, until it reached its present size at the end of 1911, when the present foundry was built. The plant covers an area of about 9 acres and consists of four main buildings, viz: planing mill and separator shop, finished stores building, engineering shop, and office building. Their relative positions are shown on the plan of the works.

VIEW OF WORKS. THE GEO. WHITE & SONS, CO., LTD., LONDON, ONT.

The Planing Mill.

The planing mill is in a brick building 200 ft. long by 140 ft. wide. It is divided into two parts, each 100 ft. long, by a brick wall fitted with fire doors. One half forms the planing mill and has one storey only, while the other half is a two storey building and forms the separator (thresher) department. On the upper floor of the latter, the lighter parts, such as chaffers, are manufactured; while the framing and heavier parts are made, and the whole machine assembled on the ground floor. The shop has large window areas and artificial illumination is by 150-watt tungsten lamps. An illustration of the planing mill is given on page 66. It is a well-lighted shop and contains a full equipment of modern wood-working machinery. The latter is operated from line shafting, the whole shop being driven by a small horizontal Corliss steam engine. Each machine has its cutters provided with a hood connected to a central exhaust fan, which gathers up all chips and sawdust and delivers same to the boilers which supply steam for the engine. This building is heated by indirect radiation on the overhead system, the installation having been put in by Sheldons, Ltd., Galt. The shop is lighted by incandescent gas arcs, supplemented by drop lights at each individual machine.

Finished Stores.

This is a brick building, 211 x 133 ft., with a saw tooth roof of five pitches. Here are stored, previous to shipment, the finished traction engines, threshers, portable engines, etc. Along the north side of the building is a depressed standard gauge track for shipping purposes. This track brings the flat cars on a level with the floor, enabling the thresh-

ing engines, etc., to be easily run onto them.

The Main Shop.

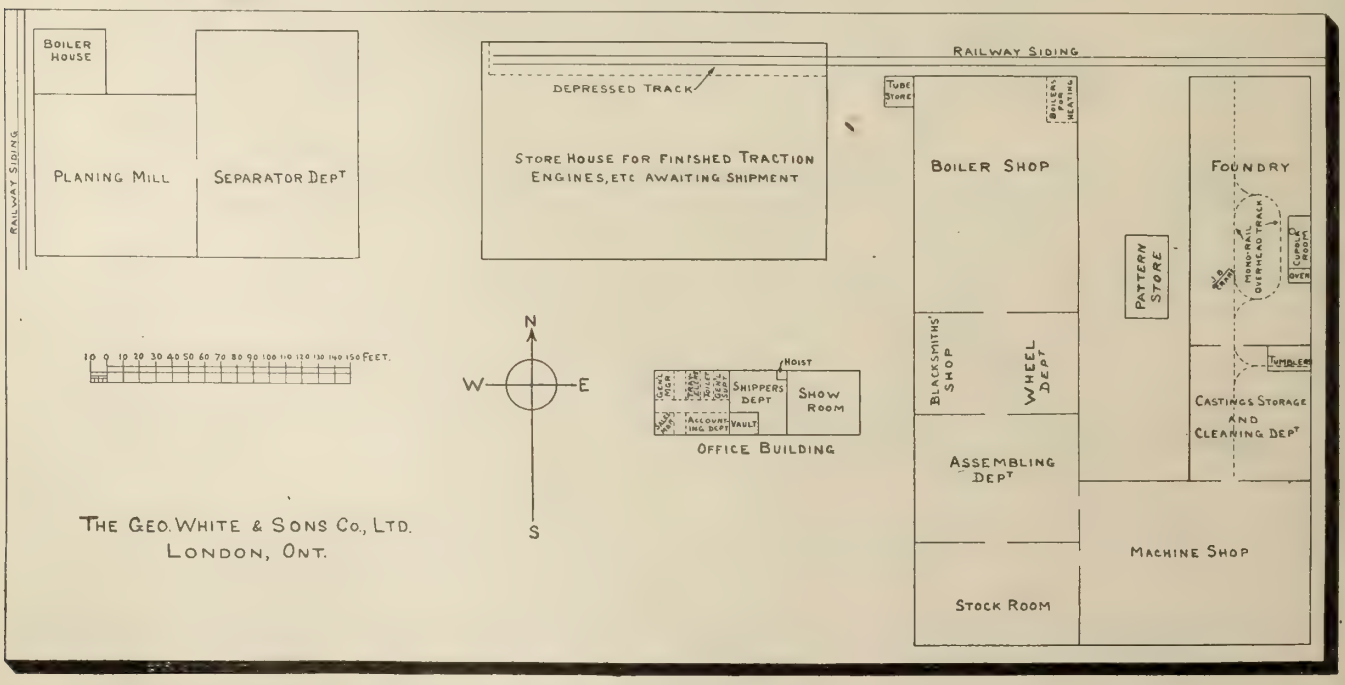
The main shop is built of hollow concrete blocks, as made by the Ideal Concrete Machinery Co., and is in the shape of the letter U, the two legs pointing north. The east leg forms the foundry and the west leg the boiler shop, blacksmith shop and erecting shop and stock room, while the connecting bay is the machine shop. A railway siding runs across the top end of the east and west legs, so that pig iron for the foundry and steel bars, plates, etc., for the boiler shop and smithy, are unloaded at the nearest point to their eventual destination.

The west bay, as above mentioned, is divided into several departments, viz., the boiler shop, blacksmith and wheel shop, and erecting shop. Each shop is of heavy mill construction and is in three bays; a glazed monitor roof running the whole length of the building. The centre bay is served by a 10-ton electric crane operated from floor level. This is by Geo. Anderson & Co., Ltd., Montreal, and by means of special crane doors can pass out at the north end of the building in order to unload material from cars on the track outside. The middle bay of the shop is not much used for manufacturing purposes, but forms a crane midway for the transference of material from one department to another. Manufacturing is therefore carried on principally in the two side bays only, each department being separated from its neighbors by partition walls. These run out into the centre bay, it having been the original intention to provide doors between each section of the shop. However, there would have been no great advantage gained by so doing, and the idea was never carried out.

This west leg of the building measures 248 feet long by 100 ft. wide, the side bays being 37 ft. and the centre bay 26 ft. Heating is by indirect radiation on the Sheldon system. A concrete duct runs down the middle of each shop and 15-inch tile ducts branch off from this to the foot of every alternate column, the bases of which are formed of a hollow casting with large openings on opposite sides. In this way the heated air issues at floor level with very efficient and economical results. Economy in heating is especially important here, since the shop is electrically driven by power purchased from outside sources; consequently, there is no exhaust steam available for heating and live steam has to be generated for the purpose.

All departments in this main building are artificially lighted by 400 c.p. gas arcs, with the exception of the foundry.

The Boiler Shop.



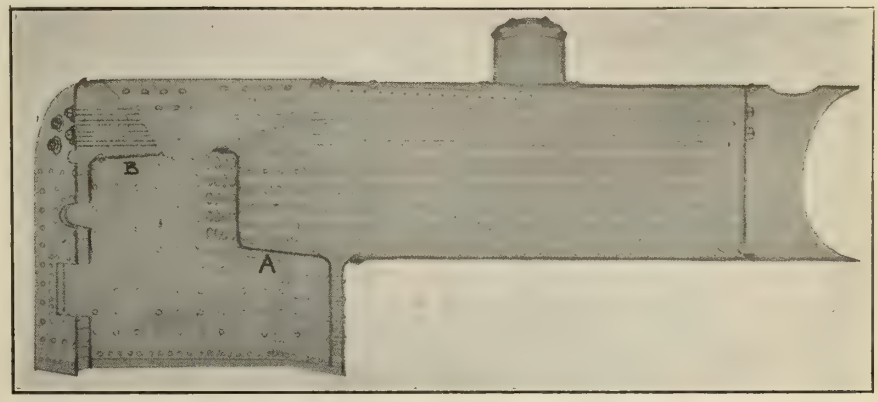
The boiler work turned out by the company impresses one very favorably,

A VIEW IN THE MACHINE SHOP.

INTERIOR OF PLANING MILL.

LAYOUT OF THE PLANT.

the workmanship and general finish being of a high order. The orderliness of the shop is also very noticeable; all plates are stored vertically in neat racks of W. I. pipe and are classified according to their thickness and future use. The boiler makers and boilersmiths work on the west side of the shop, while in the opposite bay are the rolls, punches, etc. The equipment is all belt-driven and includes a McGregor-Gourlay punch, with 48-inch throat; Lennox rotary bevel shear; flanging clamp; plate bending rolls, etc., etc. These are served by two light hand travelers which run the full length of the bay.



Reaming, riveting, chipping and caulking are done by pneumatic tools, the outfit including Boyer holders-on and riveting hammers, Cleveland chipping hammers and Monarch air drills.

In addition to building the ordinary locomotive type of boiler, the Geo. White & Sons Co. make a similar boiler for burning straw, which has proved very popular in the Canadian West. In this boiler the fire-box, instead of being square, has the upper part of the flue sheet set back about 20 inches towards the rear end of the box, as may be seen in the sectional view on this page. The boiler thus has what the company term a double crown sheet, the lower sheet being seen at (A) and the upper at (B). Immediately inside of the fire door is fitted a dead plate which occupies the back end of the fire box, and from this straw grates extend to the front end. Draft dampers are so arranged that air can be admitted at either or both ends of the fire box as may be required. The straw is burned on the grates immediately beneath the lower crown sheet (A), from which baffle plates extend to within six inches of the rear end of the box. Passing around these baffle plates, the flame comes in contact with the upper crown sheet (B) and then passes into the flues, which by reason of the peculiar formation of the fire box are twenty inches longer than in a square fire box of the same overall length. This gives the boiler a greatly increased heating surface, while its weight is increased very little and its size not at all.

The Blacksmith Shop.

This department, 63 x 100 ft., also presents a very orderly and neat appearance, bars, angles and other material being neatly stacked in such a way that they may be easily got at. There are five forges, two being specially adapted for heating rings and bar work generally. The work is of a light character, so that a single No. 7 Beaudry belt-driven power hammer answers all requirements. In the south-west corner of the shop is the air compressor—a Rand two-stage machine of 400 cubic feet capacity. This is belt-driven by a 65 H.P. A. C. Lancashire motor, and provides air for the boiler shop, assembling shop, foundry, etc.

The east bay of this department forms the wheel shop and here the heavy road wheels are assembled. The rims are made from steel plate, and the spokes from steel bar securely riveted to rim and hub. The latter is a malleable casting of substantial design. The large "bull" gear wheel, by which motion is transmitted from the engine to the road wheels, is fitted on a turned journal and drives the road wheel by dogs fitting between the spring housings. This makes an efficient cushion for taking up shocks that would otherwise be transmitted to the gearing.

THE WHITE SPECIAL STRAW BURNING BOILER.

This department has a jib crane centrally placed to serve a large portion of the floor. There is also a hydraulic wheel press for pressing crank discs upon their shafts and for forcing in crank pins.

Assembling Department.

The assembling department measures 100 x 79 ft. and takes care of the erection of new work and also the repair of old engines. The east bay roof is carried by a double row of columns in order to support crane runways. This bay forms the erecting shop for new engines and three of its bays are equipped with overhead travelers running transversely across the shop. These travelers were built by Geo. Anderson & Co., Ltd., Montreal, and are each of 15 feet span and 4 tons capacity. Their longitudinal and cross-traversing motions are operated by hand from floor level, while the hoisting motion is by electric power.

In the west bay old engines are repaired and new engines tested in steam, for which latter purpose there are four smoke jacks for carrying off the smoke and exhaust steam. For repair work there is a central jib crane for lifting cylinders, crank shafts, etc. When it is necessary to lift the boiler, the engine is run into the middle bay, where the 10-ton traveler can reach it.

After being steamed, the engines are painted, and then pass out into the yard outside. From thence they go to the finished store-house, being towed by a

INTERIOR OF BOILER SHOP.

traction engine which here serves the purpose of a yard "dinkey engine."

The Machine Shop.

The south leg of the building forms the stock room and machine shop. The former measures 100 x 63 ft. and is fitted up with the usual racks and shelves for the convenient accommodation of finished and semi-finished material. Here, too, is situated the Sheldon heating apparatus which warms the machine shop and the west leg of the building. The stock room is divided from the machine shop by a wall fitted with fire doors.

A view of one corner of the machine shop is seen on page 66. The floor area measures 100 x 142 ft., the width being divided into a centre bay of 25 ft. and two side bays of 37 ft. 6in.

The north bay is chiefly used for bench work, pipe work, and storage of material waiting to go to the erecting shop. The machine tool equipment is operated from two lines of shafting driven by motors. It is of the usual type met with in a shop of this description and includes a fine 36 x 36 in. x 12 ft. planer by John Stirk & Sons, Halifax, England. This was installed about 18 months ago, as was also a 52 inch boring mill by the Baush Machine Tool Co.

Cylinders have the crosshead guide cast integral with them and both are bored at the one setting on a McKechnie-Bertram lathe. One frequently meets with these old lathes still being used for accurate work in different parts of the country, and the fact speaks well for the careful workmanship originally put into them.

The Foundry.

The foundry building is the most recent addition to the plant and went into operation at the end of 1911. It forms the east leg of the main building and is 257 feet long by 75 feet wide, divided by a wall into two parts. The larger part forms the foundry proper and the smaller the castings storage and cleaning department. The foundry is at the north end of the building and is 174 ft. long by 75 ft. wide. It is of the same general style of construction as the boiler shop, erecting shop, etc., except that the columns are of heavy 6-inch, W.I. pipe, instead of timber. The heating apparatus here was also manufactured by Sheldons, Ltd., and is carried on an overhead platform at the north end of the shop. The heated air is delivered to the foot of alternate columns by underground ducts, similarly to the other shops. Artificial lighting is by 250-watt tungsten lamps.

The foundry has two side bays 26 ft. 6 in. wide and a centre bay of 22 ft. There is a monitor roof the full width of this centre bay with side windows which can be opened or closed from floor level. The cupola room is in the east bay and contains a 42-inch Calumet cupola of the double tuyere type. A comparatively soft blast is used (8 to 9 ozs.), since the cupola is of ample size for the needs of the foundry and never requires to be

A VIEW IN THE ASSEMBLING DEPARTMENT.

INTERIOR VIEW OF FOUNDRY LOOKING SOUTH.
Note the overhead Mono-Rail Runway which here takes the place of a Traveling Crane.

forced. The blast is supplied by a No. 8 Sheldon Noiseless Fan.

The driving gears used on all the traction engines are made from a semi-steel mixture containing 25 per cent. of steel scrap. The daily cast averages 7 tons, including about 1 ton of semi-steel, which is always run off first. In melting the semi-steel, the coke bed is, of course, first made up and immediately on top of it is put a layer of 3/8-inch steel plate scrap. On top of this comes the pig iron and then the cast iron scrap and returns (sprues, etc.) The steel scrap, as above mentioned, constitutes 25 per cent. of the total charge.

No dry sand moulds are made, so that one small oven, for core drying, is sufficient for the needs of the shop. This is situated alongside the cupola room and is fired by coke in the usual way. The oven is fitted with shelves and in order to fully utilize all the available space there is a truck with several tiers of shelves, which can be run in on a narrow gauge track. A similar track along the east wall of the foundry, north of the cupola room, brings in pig, scrap and coke from the yard outside and delivers same to the charging platform elevator. South of the cupola room, the east bay is occupied by the core makers, while north of it, light floor moulding is done. The north end of the west bay is taken up by ten bench moulders, the rest of this bay being given over to the heavier floor work, for which purpose it is equipped with a 14 ft. jib crane. No very large castings are made, the heaviest weighing about 800 lbs. The machine moulding equipment includes two Farwell squeezers, two Osborne straight-draw machines and one Pridmore roll-over machine.

The middle bay is not used for moulding but forms a midway for the transfer of castings to the cleaning department and for the passage of ladles up and down the shop. It is equipped with an overhead mono-rail runway installed by W. D. Beath & Son, Ltd., Toronto. This runs the whole length of the foundry and cleaning room, with a switch into the tumbler room. The runway is indicated by dotted lines on the plan of the foundry—see page 66—and it will be noticed that it forms a loop in front of the cupola. By this means, ladles of molten metal up to 2 tons in weight are quickly transferred from the cupola to any part of the foundry. At the light moulding floor the metal is poured from the large ladle into hand ladles, and at the heavy floor the large ladle is transferred bodily to the jib crane. In this way the carrying of metal from the cupola to the various floors by hand is entirely eliminated.

The runway may be clearly seen in the half-tone illustration of the interior of the foundry. It has a capacity of 2 tons on each trolley and consists of a 10-inch I-beam. There are nine junction switches arranged in groups of three each, permitting a trolley coming from a branch line on to the main line to turn to right or left, and at the same time leave the main line intact. The junction switch on a "Beath" runway has no moving parts. The trolley is fitted with a guiding bar by means of which the operator can direct the course of the trolley to right or left at the switch, without the necessity of stopping. This feature is particularly valuable where one man following another wishes to switch to a different track. The trolleys are fitted with "New Departure" ball bearings and are of the bogie or swivel type, enabling them to travel round sharp curves with a minimum of friction.

The Cleaning Department.

At the south end of the foundry, and divided therefrom by a wall, is the cleaning room and finished castings storage. It measures 82 x 75 ft. and is singularly free from the dust and dirt usually associated with a cleaning department. This is accounted for in part by the fact that only the larger castings are cleaned here, the smaller ones being treated in two tumbling mills fitted with dust exhausters and located in a special department in the north-east corner of the shop. Here, too, are found the emery grinders, so that all dust is localised.

The south end of the cleaning room is fitted up with racks and shelves for finished castings which are here stored preparatory to going to the machine shop. A small space on the east side is set apart for a few pattern makers. The company have a very complete line of patterns on hand for their various lines, so that they have no need of a regular pattern shop at present.

Patterns are stored in a two storey concrete fire-proof building measuring 47 x 27 ft. The location of this may be seen on the plan.

Office Building, Etc.

This building is handsomely furnished in quarter oak, with separate offices for the heads of each department. The ground floor of the rear half of the building forms the shipping clerks department and also a show room where one of the firm's standard separators, with its sides removed to show the working parts, is always available for inspection. It is operated by belt from a motor. The upper floor forms a store room for finished repair parts, a large number of which are always on hand so that customers may be enabled to make good an accident with a minimum of delay. There is also a small drawing office on this floor.

The officials of the company are:

George White, Sen.—President.
Arthur W. White—General Manager.
Fred. J. White—Sales Manager.
H. B. White—General Superintendent
H. F. White—Assist. Superintendent.
E. A. White—Accountant.
George. E. White—Western Manager.

OIL ENGINES FOR TRAINS—THE "PARAGON."

ELECTRICALLY-DRIVEN trains, trains, deriving their power in the first instance from crude oil, and dispensing with overhead wires, third rails, and extensive power stations, may, says the "Standard," be seen in the near future in the London suburban service of one of the big railways. These trains are expected to run at a cost of 3 cents per train mile, as compared with the cost of 6 to 10 cents per mile on the existing steam system. The locomotive specially designed for this purpose will have a total weight (without fuel) of 35 tons, and will haul the customary suburban train at a maximum speed of 40 miles per hour. Apart from the economy in running cost, it is expected to reveal a great advantage over the suburban tank engine in rapid acceleration upon leaving a station. The engine by which this remarkable development is to be accomplished is stated to have a far greater efficiency than any oil engine yet constructed.

Silent in Operation.

In spite of the relatively high efficiency of the Diesel oil engine, one of the joint inventors of the "Paragon" is reported to have said there are several difficulties militating against the application of the former to railway work. The noise of the exhaust and the large quantity of water required for cooling purposes are prominent amongst these. The engine they have designed for use around London and also for a large rail car in the colonies will be almost silent in operation, and will require comparatively little water for cooling purposes. The exhaust, instead of discharging into the atmosphere at a high pressure and temperature, will leave the cylinders at almost atmospheric pressure. The heat, instead of escaping with the gases or boiling the water in the cylinder jackets, will be converted into energy. With the most efficient heavy-oil engines in use to-day, from 35 to 40 per cent. of the heat in the fuel is wasted in the cooling jacket and the exhaust. The "Paragon" engine will

show nearly 20 per cent. greater efficiency on this point alone.

Greater Efficiency Promised.

This greater efficiency, continued the inventor, is secured by expanding the exploded vapor to a greater degree than in the Diesel type of engine. By transforming the power thus obtained into electrical energy, and then driving the train by an electric motor, an efficiency far in excess of that obtainable by steam power is guaranteed. It will be possible, too, at first to run one of these oil-electric trains in amongst the existing train services and thereby obtain an actual comparison of efficiency and running cost. To the railway that favors oil-electric trains for long or short distances in preference to "electrification," there is no problem of reconstructing the telegraph services. In an oil-electric train the electrical circuit is so self-contained that no baneful effect is produced on the telegraph systems.

CANADIAN RAILWAY PROFITS.

IN an interesting table just compiled by Mr. J. L. Payne, Comptroller of Statistics for the Railways and Canals Department, and tabled in Parliament, it is shown that during the twelve months ending June 30, 1912, there were 2,953 additional miles of railway put in operation, with 1,738 miles more reported ready for operation, and 10,000 miles under construction. All told the railway mileage of Canada is now over 30,000, exclusive of sidings, double-tracking, etc.

Eliminating Government lines, the total capital liability of Canadian railways on June 30 last was:—Stocks, $770,459,351; bonds, $818,478,175, a total of $1,588,937,526, or $50,832 per mile. On this capital investment dividends were paid last year totalling $31,164,791, equalling 4.04 per cent. on the total stock issue. The rapid growth in net earnings may be gauged from the fact that in 1907 dividends totalled only $12,760,435.

The total federal, provincial and municipal cash aid now totals over $208,000,000, while land grants total over 56,000,000 acres. Federal and provincial bond guarantees aggregate $245,070,045, of which the Dominion's share is $91,983,553. Alberta has pledged its credit to the extent of $45,489,000; British Columbia, $38,946,832; Saskatchewan, $32,500,000; Manitoba, $20,899,660, and Ontario, $7,860,000. Cash aid to railways totalled $5,892,818 for the twelve months, including $4,994,416 to the Grand Trunk Pacific under the "implement" clause.

Traffic shows a record gain during the year. The number of passengers carried was 41,124,181, an increase of 4,026,463 over 1911. The number of tons of freight hauled was 89,444,331, a gain of 9,560,049. The traffic increase is reflected in the gross earnings, which totalled $219,403,753, a betterment of $30,670,259, or a little over 16 per cent. In ten years the gross earnings of Canadian railways have more than doubled. Operating expenses last year amounted to $150,736,540, or $19,691,494 more than in 1911. Net earnings were $68,677,213, an increase of $10,978,504 over the preceding year. Net earnings per mile of line last year were $2,570, as compared with $2,272 in 1911.

Additional Gross Earnings.

The outside operations of Canadian railways in 1912 created additional gross earnings of $21,221,775, and operating expenses aggregating $15,333,618.

	1911.	1912.
Earnings per mile of line	$7,430	$8,210
Operating expenses per mile of line	5,159	5,639
Net earnings per mile of line	2,271	2,571
Freight earnings per train mile	2,494	2,376
Passenger earnings per train mile	1,348	1,390

Following were the sources of revenue and amounts for 1911 and 1912:

	1911.	1912.
Passengers	$50,566,894	$56,543,664
Mails	1,869,414	1,914,720
Express	4,674,135	5,294,388
Baggage, parlor cars, etc.	1,207,555	1,295,415
Freight	126,570,534	149,961,140
Station and train privileges	826,252	1,086,687
Telegraphs, rents, etc.	3,018,710	3,307,739
Total	$188,733,494	$219,403,753

Operating Expenses.

The distribution of operating expenses in 1912 was as follows:

	Amount.	P.C.
Way and structures	$31,514,098	20.90
Equipment	29,811,510	19.78
Traffic expenses	5,293,700	3.51
Transportation	78,969,544	52.39
General expenses	5,137,688	3.42

The equipment reported in use on 30th June, with the additions for the year, was as follows:

Locomotives	4,484	265
Cars in passenger service	4,946	433
Care in freight service	140,918	13,760
Cars in company's service	10,466	888

A HIGH SPEED FILE.

MANUFACTURERS in Sheffield, England, are displaying marked activity and enterprise in producing files of high efficieny, and to an increasing extent, users are buying such goods on the basis of the amount of work they do under mechanical tests instead of merely accepting the lowest tender. American competition in this important industry, it is claimed, was practically eliminated from the British market several years ago, and Sheffield makers have gone well ahead of their trans-Atlantic rivals in developing what is known as the "high-speed" file.

We have before us the report of a test by the Sheffield Testing Works, Ltd., of the high-speed "Lightning" file, which has lately been placed on the market by Lockwood Bros., Ltd., of Sheffield. According to this report, a 14-in. file, tested on both sides, made 120,000 strokes, and in 39 hours removed 78.80 inches of metal weighing 22 lb. from an inch-square bar. At the conclusion of this severe trial, the tool was reported to be "slightly worn." The makers claim the result of the test to represent the highest point of working efficiency ever attained by a file under similar condition. It may be of interest to state that the British Admiralty require the files they buy to make only 20,000 strokes and to remove six inches of material. The "Lightning" file, it is claimed, will do treble the amount of work of an ordinary file.

TOLL OF RAILWAYS.

ACCIDENTS in connection with the operation of Canadian railways in 1912, resulted in the killing of 568 persons and the injuring of 3,780. These totals represent an increase over 1911 of 73 in the number killed, and of 451 in the number injured. One passenger in every 872,855 was killed, and one in every 84,792 injured. The killed and injured from the movement of trains were divided by classes as follows:

	Killed.	Injured.
Passengers	47	485
Employes	215	1,606
Trespassers	235	193
Non-trespassers	48	120
Postal clerks and others		33

Contributory Causes.

The causes of death and injuries to passengers in 1912 were as follows:

	Killed.	Injured.
Collisons	18	73
Derailment		203
Parting of trains		4
Falling from trains	10	51
Jumping on or off	4	70
Struck at highways	4	2
Struck at stations	3	4
Struck at other points	1	1
Other causes	7	77

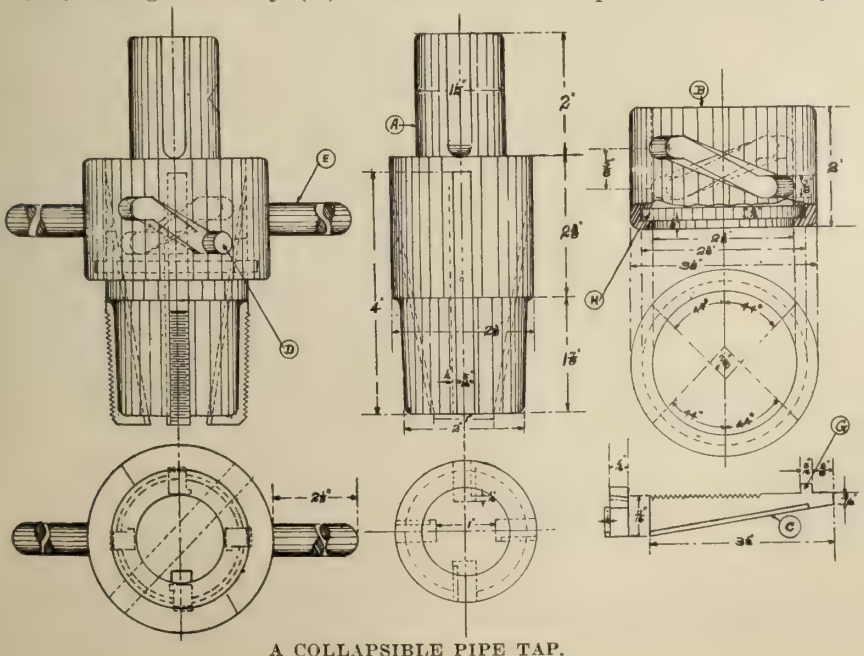
There were 110 persons killed on electric railways, an increase of 8, and 3,128 injured, as compared with 2,670 in 1911.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

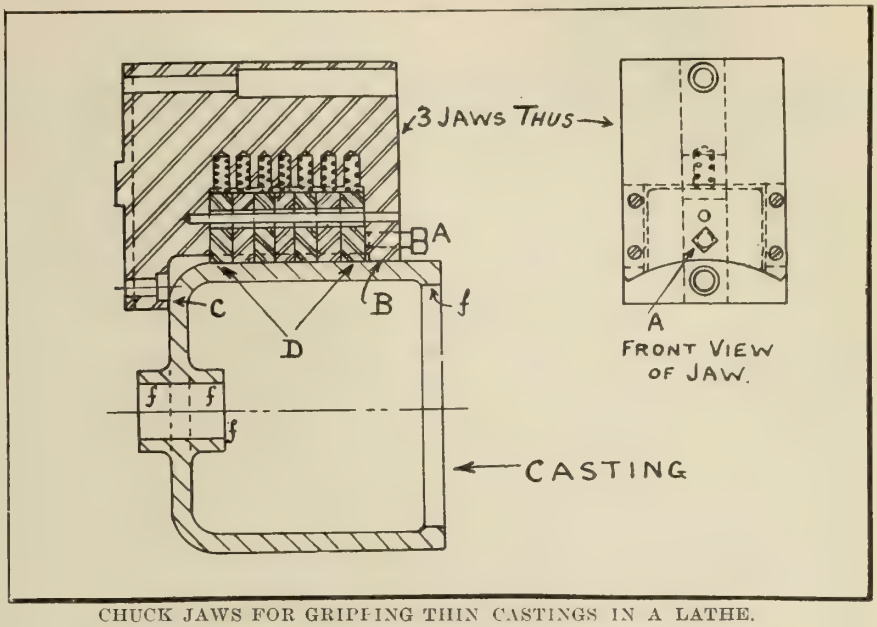
A HINT FOR DRAFTSMEN.

By F. H. M.



FOR tightening the fulcrum nut on a divider or compass joint, a broken pocket knife blade makes a handy tool. The blade may be ground down to fit the slots in the nut and is very much stronger than the key usually furnished with a set of drawing instruments. Moreover, it is not so liable to become lost. If it is a two-bladed knife which is used, the other blade can be kept in good shape for pencil sharpening or else it will come in handy as a lever for pulling thumb tacks.

A COLLAPSIBLE PIPE TAP.



By F. L., Montreal.

THE accompanying cut gives all necessary dimensions for making a 2-in. collapsible tap. Such taps are made from 1-inch to 10-inches diameter (pipe sizes) and give good results.

The machinery steel body (A) is turned all over to the dimensions given, and has four tapered slots in which the tap blades slide. For moving the blades up or down in the slots, there is an operating collar (B),—also of machinery steel. The tap blades are carried in this collar by means of the recess seen at (H). The two handles (E) serve to turn the operating collar, which thus raises or lowers the taps by means of the two slots working on the pin (D), the latter being driven tightly through the body (A). One of the tap blades is shown at (C). They may be of carbon or of high-speed steel, and are first fitted to the slots in the body (A) and then turned and threaded —a master hob being used for the latter operation. When assembling the tap the pin (D) is driven out and the collar (B) is lowered towards the small end of the body (A). The blades are then slipped into place, so that the projection (G) engages with the recess (H) in the collar. The collar, with the blades, is then raised to its proper position and the pin (D) is driven into place. All machinery steel parts are case-hardened. With blades of high-speed steel a 2-inch tap like this can be run at 60 R.P.M.

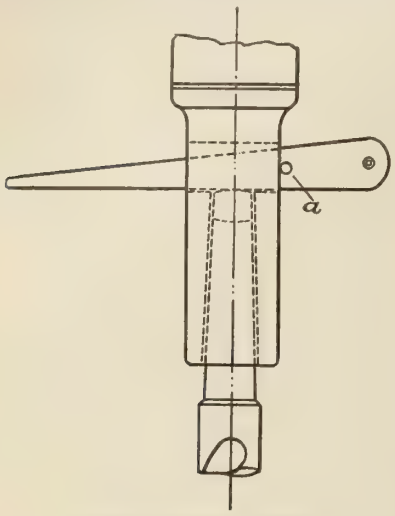
A COLLAPSIBLE PIPE TAP.

CHUCK JAWS FOR GRIPPING THIN CASTINGS IN A LATHE.

CHUCK JAWS FOR GRIPPING THIN CASTINGS IN A LATHE.

By F. H. M.

AN interesting method of holding work in chuck jaws is shown in the accompanying sketch. The special chuck jaw shown is intended to hold the casting securely without springing it out of shape, while it is being bored and faced at the parts marked (f). The better to enable it to do this, the jaw is made in sections which are backed by small coil springs.



When chucking the work the screw (A) is first loosened, thus allowing the coil springs to push out the floating pieces (D) slightly beyond the face (B). The work is next placed in the chuck with its back against the inner face of the jaw as seen at (C). The three jaws are now tightened up by means of the chuck screw until the face (B) bears on the work and the latter runs true. In the meantime, the coil springs have adjusted the floating pieces (D) to the outline of the work and they are now securely locked by the screw (A).

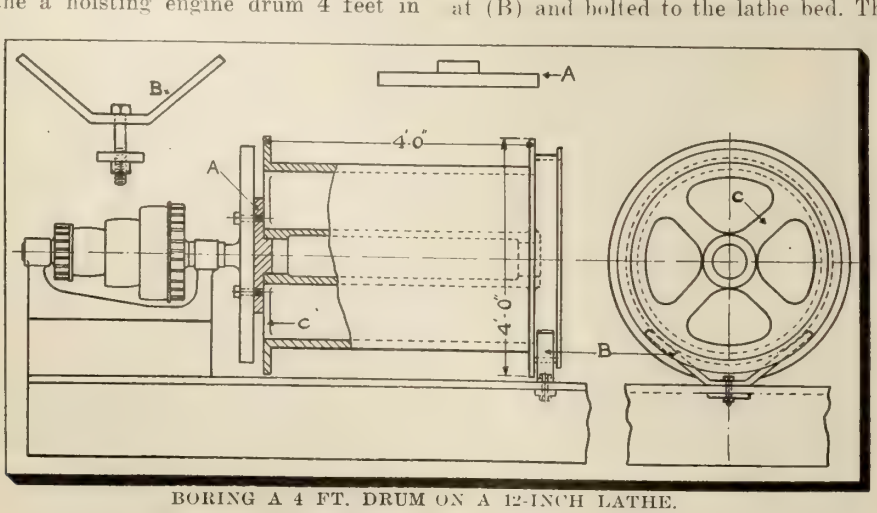
It will be seen that the jaws will readily accommodate themselves to considerable irregularities in the surface of the casting, thereby eliminating its tendency to spring.

TAPER-SHANK DRIFT.

By A. B. C.

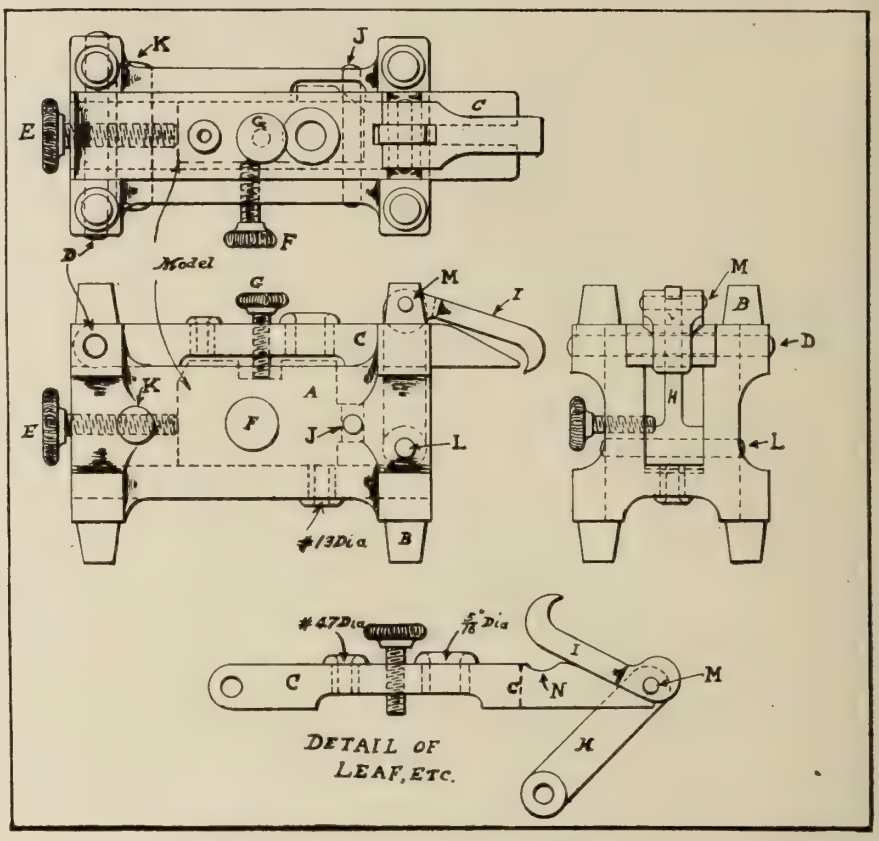
DRIVING out a drill, a butt-mill or any tool having a tapered shank, from the spindle of a heavy-pattern machine, such as a radial drill or boring mill, by means of a "drift," requires several hard blows of a hammer on the end of the drift before the tool will

TAPER SHANK DRIFT.



ease up, and when the tool gives way, the drift becomes tightly wedged in the broach of the spindle. To remove the drift, the workman must reach around the other side of the spindle and hammer the drift backwards. This is very inconvenient, since his two hands are occupied, one holding on to the tool and the other holding the hammer. The drift, when struck even lightly, generally flies a considerable distance from him, and to prevent this, the accompanying sketch shows a brasspin (a) about 3-16 in. dia., placed in the drift, which secures the latter against sticking in the broach, and makes it easy of removal by hand.

BORING A 4-FOOT DRUM ON A 12-INCH LATHE.



By G. Barrett.

THE following description shows how we rebored and bushed on a 12-inch lathe a hoisting engine drum 4 feet in diameter. The first operation, of course, was to pack up the headstock sufficiently to swing the work. One end of the drum was then bored to suit the new bushing. We next searched the scrap heap and took from it a cast iron plate about 12 inches in diameter by 1 inch thick. This was clamped to the lathe face plate by ¾-inch cap screws. The plate is shown in the cut at (A). As will be noticed a boss was turned up at its centre, of a diameter to fit the end of the drum already bored. This boss was ⅜-inch high. The drum was easily clamped to the face plate by means of the arms at the end as shown at (C).

Next a piece of mild steel plate, 4x1 inches, was bent into the shape shown at (B) and bolted to the lathe bed. This made a good steady rest for the drum and took the strain of the overhang off the lathe spindle. The outer end of the drum having been bored, the new bushings (not shown) were driven in, and to our delight the drum shaft slipped easily through into its place, showing that the two bushings were in perfect alignment.

BORING A 4 FT. DRUM ON A 12-INCH LATHE.

A NEW CAM DEVICE ON DRILL JIG.

A NEW CAM DEVICE ON A DRILL JIG.

By A. L. Monrad.

THE fact that the work to be drilled in this jig was very short and broad made advisable a construction that would eliminate the use of a long handle for operating the clamping leaf. The design herewith illustrated has proved entirely satisfactory and makes a short, compact jig.

A machinery steel block was worked out as shown at (A), large rounded inside corner being provided in order to eliminate all spring of the side walls during the operation. Hardened and drawn tool steel legs (B) were screwed in on top and bottom as shown, their bearing faces being then ground up perfectly square and parallel with one another. These faces formed a finished surface, with which the inside of the jig was finished parallel.

The clamping leaf (C) is fulcrumed on a 5-16 inch pin (D). This pin is a driving fit in the steel frame, but a turning fit in the leaf, to allow the lat-

ter to be swung up out of the way when reaming the front, or 5-16 inch hole, in the work. The hole in the leaf for the fulcrum pin must, therefore, be absolutely square with the inside of the jig. The knurled screws (E), (F) and (G) keep the work in position against the stop pin (J) and against the bottom and one side of the jig. The pin (K) forms a nut for the screw (E).

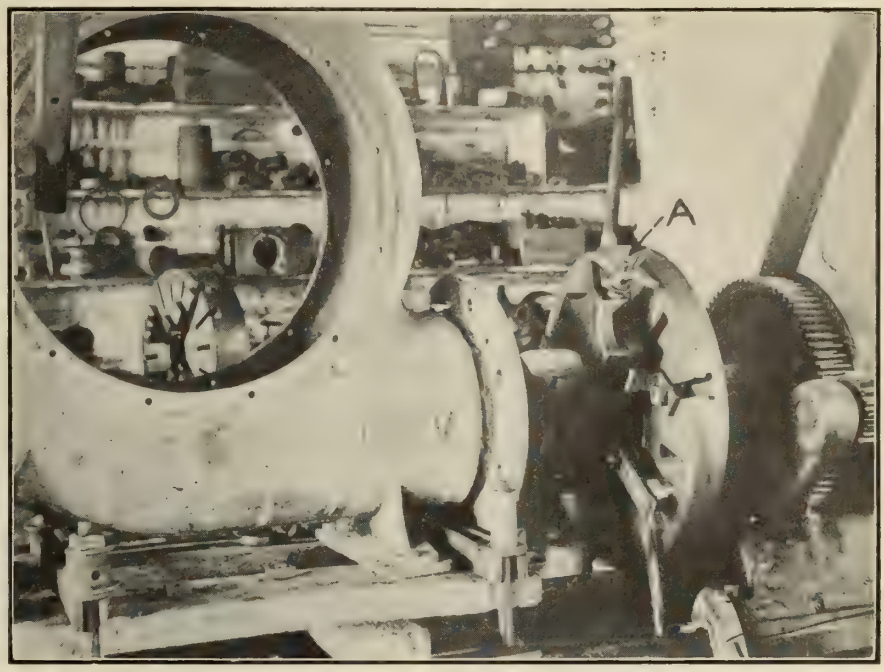
A swinging link (H) is held with a pin (L) through the jig frame. At the other end of this link is located the cam (I). This swings on an eccentric pin (M), and, when seated, secures the clamping leaf against the two shoulders on the jig frame. The leaf has a slot in it, as seen in plan, to accommodate the link (H), and on each side of the slot it is milled out for the cam, as shown at (N). To disengage the work, the cam is turned and slides down the inclined nose of the clamping leaf as seen in the detail.

TWO HANDY HOME-MADE TOOLS.

By Avery E. Granville.

A SHORT time ago I saw a workman in a roundhouse using the tools shown in the accompanying halftone. He had made them himself. The upper one is a file handle, or rather file holder, made to clamp to the body of the file so that it may be used like a plane, a great advantage on some kinds of work. The handle is made of cast brass, two lugs being cast on one side of the bottom for the edge of the file to butt against, while the file is gripped by a nut-lug opposite these two, operated by a thumbscrew as shown.

The second tool shown is an inside caliper. The points are made of two pieces of drill rod, which are run



TWO HANDY HOME-MADE TOOLS.

through two slots in a bent piece of flat spring. By pressing on the outer ends of this spring the rods are released and may be set as desired, but with the spring on tension it takes considerable force to move the points. The beauty of this kind of an inside caliper for rough work, is that longer rods are easily made for any ordinary job, the same spring serving for any number of rods.

AN UNUSUAL JOB FOR A LATHE.

By F. Cotton.

THE photo-illustration shows how on one occasion we faced up the outlet flange of a large blower frame casting. Not having a horizontal boring mill available, we did the job on a lathe, with very successful results. The compound slide rest was removed from the carriage and bolted to the lathe face plate, as shown. The tool holder was removed from it and four ½-inch studs 2½ inches long were tapped in and fitted with 2½ in. x 1½ in. straps to hold the tool. The latter was made of 1¼ in. x ⅞ in. self-hardening steel, bent through a right angle. The feed was obtained from the star wheel (A), which was operated by a bolt fastened to the lathe bed by a clamp. The blower frame was then strapped to the carriage, the resulting job being all that could be desired.

AN UNUSUAL JOB FOR A LATHE.

THE DOTY MARINE ENGINE & BOILER CO., GODERICH.

THIS company was incorporated last fall to take over the business of the Doty Engine Works Co., Ltd., and have now put the business on a thoroughly sound basis.

The new company is composed of the following gentlemen: John W. Doty, of New York City, President; Fred W. Doty, Vice-President and Manager; Jos. G. Reinhardt, Treasurer, Chief Draughtsman and Mechanical Engineer; William Proudfoot, K.C.. M.P.P., Secretary.

The re-organization of the business has been worked out most satisfactorily, placing the company in a position to handle the increased trade coming their way. For some years this plant has been building high-class hoisting and marine engines, and is about to commence the manufacture of well-known types of steam boilers.

The new boiler shop completed early in 1912 has been fully equipped with modern tools and is now turning out Scotch boilers up to 8 feet diameter by 10 feet long. The equipment includes 5-ft. gap riveter; 26-ft. plate edge planer; 9-ft bending rolls; combined punch, shear and angle cutter; 60-in. radial drill; etc.. etc. There is also a full assortment of small tools, pneumatic hammers, etc. Air is supplied by a belt-driven compressor. Extensive improvements are also being made in the foundry. and when these are completed, the company contemplate important changes in other departments of the works.

About 70 men are now employed, and it is said that orders on hand and in view are most encouraging.

The General Fire Extinguishing Co. of Providence, R.I., have recently completed handsome offices, warehouse and garage at 1200 Dundas Street, Toronto, and are now occupying same. This office will look after all business developing in Ontario and the middle west. Eastern business is handled from the Montreal office and Vancouver looks after the far west.

TITANIUM AS A CLEANSING MEDIUM IN STEEL MANUFACTURE.

By Frank Walker.

FOR some considerable time it has been a recognized fact that the presence of oxygen and nitrogen in steel, even in very small quantities, has a most injurious effect, decreasing the tensile strength and general wearing qualities to a marked degree. Owing to their gaseous nature, a correct analysis of steel for these elements has been most difficult to obtain. But some recent investigations, conducted with extreme care and minuteness by Sheffield and Pittsburgh metallurgists have shown that both these gases are present in open-hearth, Bessemer and crucible steels to an extent hitherto unsuspected, and the combinations which they form with other elements present, have a wide influence on the quality of the steels in question.

Effect of Nitrogen and Oxygen.

An analysis of twenty-four samples of steel showed the oxygen content to range from .021 to .046 per cent., and that of nitrogen from .01 to .062 per cent. These quantities may seem so small as to be not worth considering, but it has been conclusively proved that the presence of .030 per cent. of nitrogen in steel containing .50 per cent. of carbon causes it to become absolutely brittle, and that the presence of .030 per cent. of oxygen corresponded to .135 per cent. of ferrous-oxide, an amount quite sufficient to have a most material effect upon its resistance to stresses.

Scavenging Agents.

The de-oxidation of steel has, until recently, been accomplished by the addition of manganese, but not with perfect success, the nitrogen content remaining unaffected by the addition of either manganese on silicon. Steel-makers have recognized the fact that resource must be had to some element that possesses an affinity for both of these gases, and most successful experiments have been recently carried out with titanium, an element belonging to the same chemical group as silicon. These experiments have proved that, used in conjunction with manganese, titanium is by far the best scavenging medium yet discovered. It has a very strong affinity for both oxygen and nitrogen, and presents the only undisputed example of combustion of an element in nitrogen. It has also been found to re-act upon the sulphur content of the steel, and while not entirely eliminating it, reduces its percentage greatly by carrying a portion of it off into the slag in the form of a sulphide or sulpho-cyanide of titanium. It has, therefore, a most beneficial effect upon the three most refractory elements with which steel-makers have to contend.

Titanium in Nature.

Titanium occurs in nature in the form of a di-oxide (TiO^2) principally in conjunction with iron, but in its natural state is extremely difficult to control. It has, therefore, been found necessary for commercial purposes to separate it from the ore by electrical treatment and manufacture it into ferro-titanium, containing 12.5 to 15.0 per cent. of titanium, 6.0 per cent. of carbon, and the balance iron.

Adding the Ferro-Titanium.

This combination, if added to the steel in the manner to be described, enters into almost instantaneous solution, and the mixing is accompanied by a most interesting and peculiar phenomenon. It has been found that the best way to add the ferro-titanium is while the steel is being run from the furnace or converter to the ladle, and after the ferro-manganese has been added. Titanium is much lighter than iron, having a specific gravity of 4.87 against 7.86 for iron, and therefore should not be added too near the top of the ladle, but shovelled in gradually as it fills.

It is here that the phenomenon spoken of occurs. The titanium at once commences to attack the oxygen and nitrogen in the steel and carries them off into the slag as oxides and nitrides of titanium. This chemical work is accompanied by a great increase in temperature, and though the steel must be held in the ladle for from 12 to 15 minutes to allow the scavenging to be accomplished, at the end of this time the steel will be found to be hotter than when first tapped and in a better condition for teeming.

In conducting the experiments it was found most difficult to persuade the workmen to hold the steel for such a length of time, as such a procedure is directly opposed to all usual practice; and under ordinary circumstances the metal would become chilled in a much shorter period. But in one instance the ladle was held for 20 minutes and then teemed most successfully.

In all the experiments it was noticed that the amount of slag lifted was much greater than that from untreated steel, and also that the steel when poured subsided quietly in the moulds without boiling and the ingots when stripped were almost free from pipes.

Amount of Titanium Necessary.

As the melting point of titanium is much higher than that of iron, it is found difficult to add it to the charge in large percentages, 1.0 per cent. being found to be about the limit. But in actual practice for commercial steels, half this amount is sufficient, and of this almost all will pass into the slag in combination with the impurities it removes, leaving but a trace of titanium in the resulting steel.

Results Attained.

Its beneficial effect is, nevertheless, most marked as the following tests show:

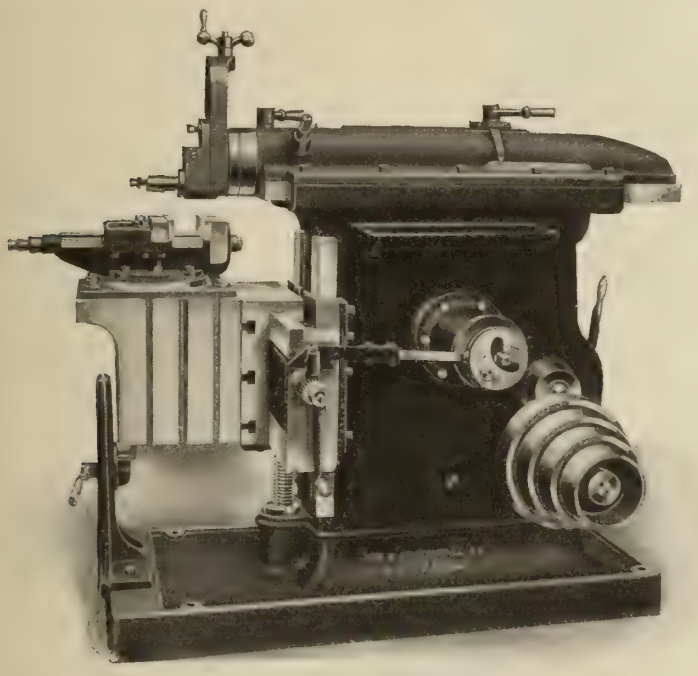
A bar of open-hearth steel containing 0.25 per cent. carbon, 0.64 per cent. manganese, 0.425 per cent. silicon, 0.04 per cent. phosphorus, and 0.035 per cent. sulphur, was subjected to a rotary vibrational test in a White-Souther machine. It was loaded to a fibre stress of 38,870 lbs. per sq. in., and broke when it had made 2,660,000 revolutions. This same steel was then treated with 0.5 per cent. of titanium, and a similar bar was then tested. This bar withstood 4,052,200 revolutions at the same fibre-stress. The stress was then increased to 40,600 lbs., and the bar withstood 10,800,000 additional revolutions without fracture.

Another steel containing 0.25 carbon, 0.30 manganese, 0.40 silicon, 0.04 phosphorus, and 0.03 sulphur, gave considerable trouble by developing edge and corner cracks, while being rolled or forged. This steel was then treated with 0.30 per cent. of titanium and gave no further trouble, working down smoothly and evenly without flaws, and retaining its working heat for a much longer period. This slower cooling by radiation is a marked characteristic of all titanium treated steels.

NEW ELECTRIC LOCOMOTIVE.

A GERMAN contemporary gives a description of a new type of locomotive, built by Brown, Boveri and Co., for the Chemin de fer du Midi. The pulleys on the spindles of the two motors are connected together by means of a coupling rod, and are each similarly connected by coupling rods to a pulley disc, carried on the driving wheel. In this way a triangular system of coupling rods is built up, and the method has been found to give good results in practice, besides reducing the weight and cost of the locomotive.

The author shows that if the two motors have the same torque there is no stress in the rod connecting them together; he therefore suggests that this rod might be omitted. The motors may therefore be connected to the driving wheel by two cranks, which form with one another an angle rather greater than a right angle. On the triangular system, the angle between the cranks is about 60 deg. The author's system has the further advantage that the precise adjustment of the positions of the various spindles is unnecessary.



DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

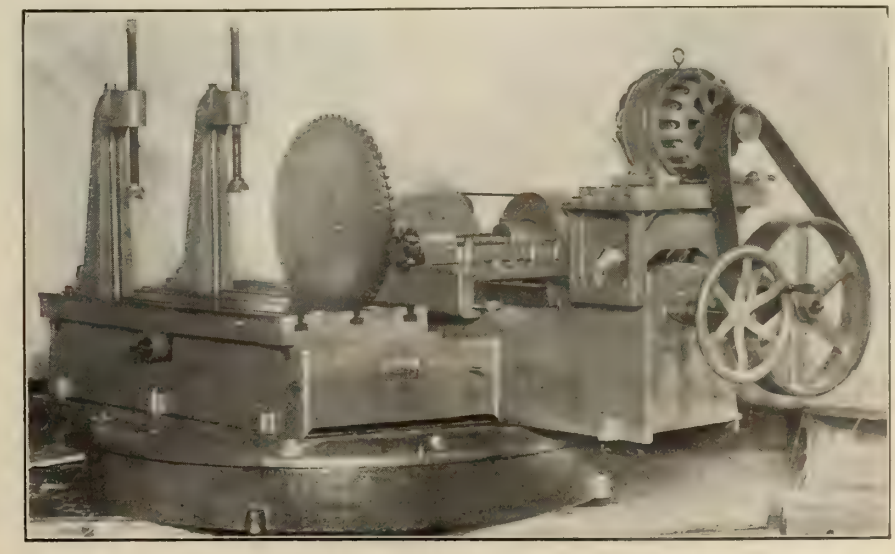
A NEW SHAPER.

THE new 20-inch back-geared crank shaper illustrated herewith is a recent development of the R. McDougall Co., Ltd., Galt, Ont., for whom the Canadian Fairbanks-Morse Co. are sales agents. The machine embodies the best features of all machines that have hitherto been placed upon the market, while at the same time non-essential points have been carefully eliminated. The tool head has a vertical travel of 8 inches and a maximum length of stroke of 21 inches. Eight cutting speeds are provided. The table is of box form with Tee slots on top and sides cut from the solid. A Vee slot on one side serves to hold round stock in an upright position. The table has 22 inches of cross traverse and 14 inches of vertical travel. It is supported at the front by an adjustable sliding rest bolted to the base of the machine. The column is well braced internally, and ample opening under the ram is provided for keyseating or other long work.

A powerful vise is provided, fitted with steel-faced jaws and swivelling base.

NEW McDOUGALL SHAPER.

COMBINATION SAW AND ROTARY PLANER.



THE accompanying text and illustration refer to the 4-B combination saw and rotary planer, recently supplied to the Northwest Steel Co., Portland, Oregon, by the Vulcan Engineering Sales Co., Chicago:—

This is the well-known Q. & C. machine, later known as the Q.M.S. saw. The great change in design of the present machines over those that were first put on the market over twenty-five years ago, will be noticed by many who are still using some of the earliest machines.

The Q.M.S. machines when arranged for motor drive are now connected by belt to motor, instead of being direct connected by gear and pinion. This is an additional factor of safety, should the blade become stuck in the work. The machines are mounted on a circular base, which permits cutting long pieces of material from any angle in the shop. They are, therefore, very desirable in a shop having limited room. The milling head is quickly and easily removed, and replaced by a saw blade, while the side table which is adjustable laterally carries an upper side table when the milling head is not in use.

The feed is of the adjustable, variable friction type, changeable at all times from ¼ to 1 inch per minute. The sprocket arbor, driving the milling head and saw blade from the periphery, is adjustable forward, to allow for 5 inches wear on the diameter of saw blade, this doing away with additional or larger sprockets where blades have been re-cut. The saw arbor is adjustable to take up any possible wear. Suitable clamps are furnished for various styles of work, and a (V) block cast in the end of upper side table permits of quick clamping of rounds or squares. Such a combination provides two machines in one, and at a low investment cost. The cut shows a machine carrying a 31¼ inch diameter saw blade, or a milling head of 28¾ inches diameter of cutters over tools. The saw blade carriage has a travel of 36 inches, and the saw blade runs at about 28 ft. per minute. The machine has capacity for 12 inch rounds, 10¾ inch squares and 24 inch I beams.

On the "Bryan" or periphery type of saw, the blade is driven by a sprocket engaging the back of saw teeth. This method of drive is an important advant-

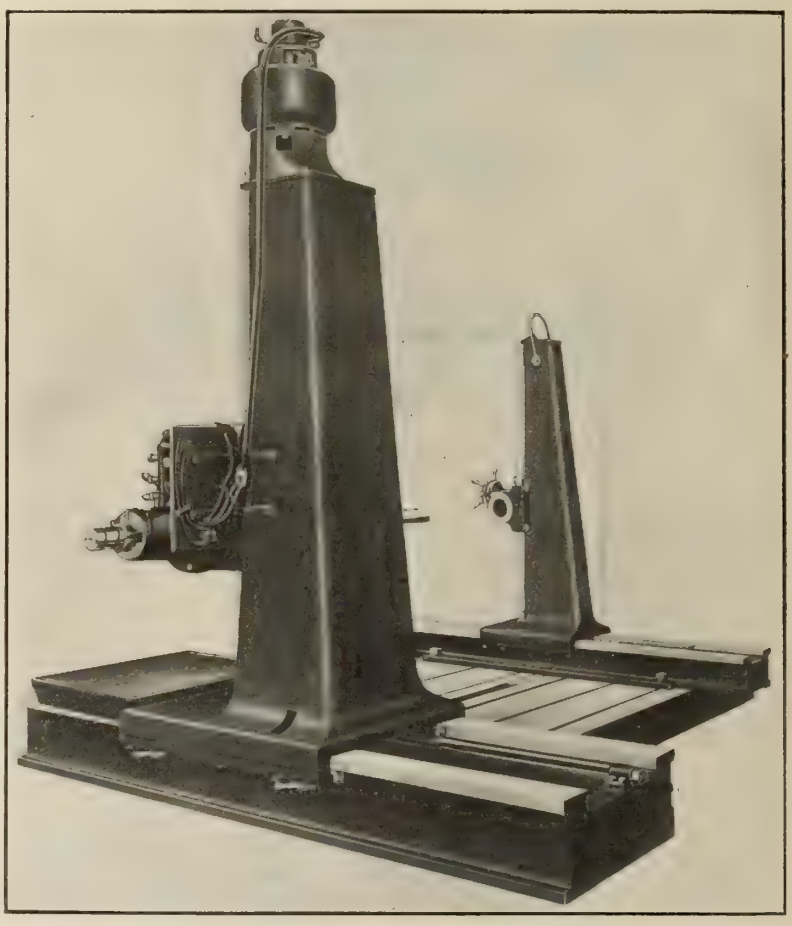
B COMBINATION SAW AND ROTARY PLANER.

age, in that a much larger diameter of the saw blade is available for cutting than when the same size blade is motor driven. On the arbor driven blade, about one-third of the diameter is occupied by driving collars. The teeth of the "Bryan" blade are of coarse pitch, and afford more room for chips than is possible in a fine tooth arbor driven blade. The adjustable friction feed can be changed when the machine is in operation, and is powerful and continuous in action through its entire range. Motion is transmitted to the feed screw through a clutch, which can be disengaged, permitting adjustment of carriage to work by hand. The machine is fitted with an adjustable stop, provided to stop carriage at any desired point of travel.

FLOOR TYPE BORING, MILLING, TAPPING AND DRILLING MACHINE.

THE text and illustrations refer to the boring, milling, tapping and drilling machines designed and built by the Rochester Boring Machine Co., Rochester, N.Y.

They have a wide range of capacity and adaptability, and combine in one unit in a minimum of space occupied, the range and capacity of several individual machines. Large, small or irregular shaped work can be machined to practically equal advantage, and single pieces can be finished rapidly, with economy almost equal to work in quantities. Boring, milling, drilling, tapping, splining, oil grooving, and rotary planing can all be done at one setting, and with swiveling table, the different sides of work can be finished complete. The precision construction, which is a feature, insures accuracy, and the mechanical features embodying quick and easy changes, conveniently obtainable, give maximum production.



The motor is mounted on top of column, free from dirt and chips, and drives, through rawhide gearing, the vertical shaft which transmits power to driving mechanism enclosed in saddle. By this arrangement, which eliminates many gears and shafts, a very high efficiency of power transmission is obtained, consequently much smaller motors can be used. Constant speed machines, either direct or alternating current may be used.

The Saddle is of box type construction, strongly ribbed, and is built as a complete unit. It is counterbalanced by weight and so constructed that the entire operating mechanism is readily accessible. The levers and handwheels for the various changes of speeds, feeds and traverses are all so arranged as to be unusually convenient for the operator. Lever for starting, stopping, and reversing the machine is also located on the saddle, and the machine is controlled by this lever without stopping main drive. Hand adjustments and reversible power feeds are provided for milling, also power rapid traverse for quickly bringing to any desired position. Aumtomatic safety stops are fitted at extreme positions to prevent accidents.

The Column is of very heavy construction with long and wide base. It is side braced and so designed as to give the utmost rigidity in all directions. It is adjustable along the bed by hand or power. Reversible power feeds are provided for milling, also power rapid traverse for quickly bringing to any desired position. It is conveniently arranged with binders for quickly clamping in any location when desired.

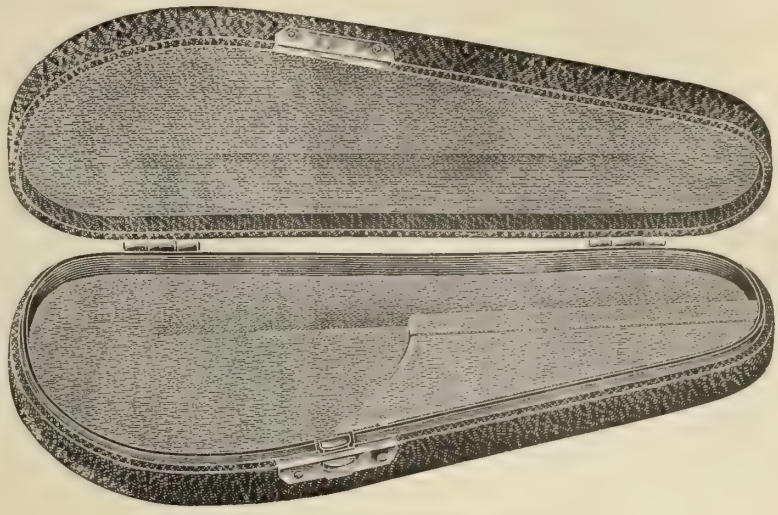
The Spindle is made of the best quality of hammered crucible steel of high carbon. It is rough-turned and seasoned before using; when finished it is ground to size on dead centres, and its alignment is correct. It is journalled in long taper bearings of phosphor bronze adjustable from the outside, provided with felt wipers, and located far apart at each end of the saddle, giving very rigid support. This is made possible by the feed and drive being applied central between the bearings. Spindle is driven by two large spline keys, fitted into steel sleeves on which driving gear is mounted. This sleeve is journalled in independent bearings and clearance is provided between the sleeve and spindle to eliminate any possible vibration from driving gears. The spindle can be furnished any desired length and by means of concentric screw feed its full traverse is obtained without resetting, regardless of length.

The Concentric Screw Feed.—An original and exclusive feature of these machines permits continuous feed for any length—and is very powerful. It is more accurate, more mechanical, and much more sensitive than the old-style feed and eliminates the usual heavy and cumbrous strongback at the end of saddle. The usual construction, with rack and pinion feed, permits only a limited amount of feed, nearly all machines being arranged so the rack or gear has to be discontinued and drawn back to take hold on the bar. On large machines the strongback and connected mechanism becomes so large and heavy as to require extra counterbalancing. The tendency of a counterweight so applied is to pull the bar out of alignment if overbalanced. If the strongback is not balanced or underbalanced, the tendency is to sag to the extent permitted by the play in the sliding surfaces. Wear or loose-

FLOOR TYPE BORING, MILLING, TAPPING AND DRILLING MACHINE.

ness in strongback clamping mechanism is reflected at the other or cutting end of spindle. This and also the side pressure to spindle, with rack and pinion feed, is entirely overcome, by the concentric screw feed.

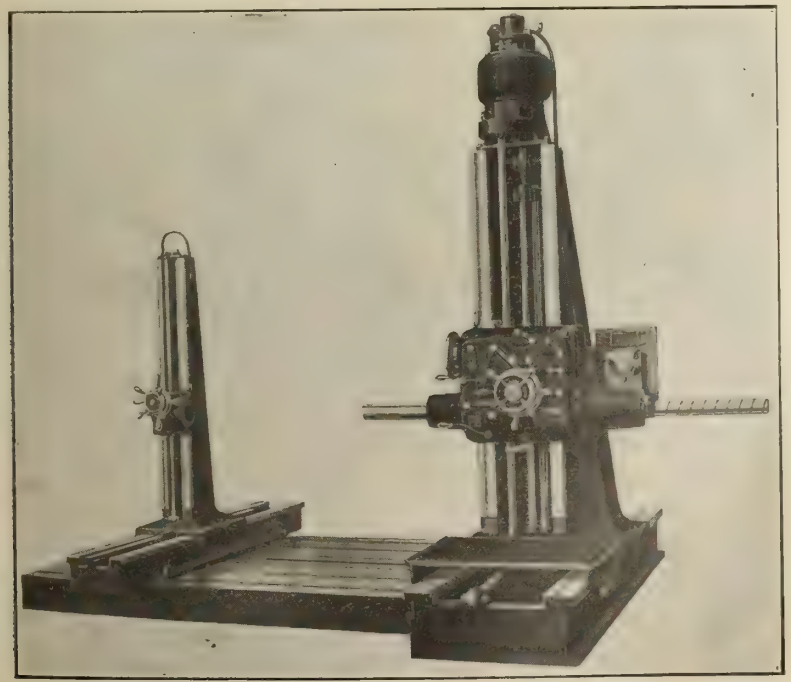
The Method of Feeding is through a long bronze nut engaging a square thread in spindle. The nut comes in contact with sides of thread only and end thrust in either direction is taken direct on ball bearings of large diameter. Instead of the usual line contact, between the tooth of the gear and rack, with the old method, it will be seen that the square thread in nut, engaged for its full length with thread in spindle, provides a very long bearing, and as the two rotate together, the possibility of wear is very remote. The nut rotates at the same speed as spindle when the feed is disengaged. When feed is applied, the nut is rotated faster than spindle, according to which feed change gear is engaged, or slower than the spindle, if feed is reversed. This differential speed between the nut and spindle gives feed in either direction. Through positive planetary gearing, the bar is controlled by hand wheel, whether at rest or running. End thrust for milling is taken direct in the saddle, with bronze thrust bearing, independent of end thrust for boring.



A Wide Range of Feeds and Speeds is provided to meet all usual requirements. Vertical milling feeds are provided for the saddle, and horizontal milling feeds for the column independent of the boring feeds. All feeds are per revolution of spindle, and are the same for every part to which applied. They are all reversible, and any desired change can be instantly obtained. No two feeds or speeds can be engaged together at the same time. Range of speeds can be readily changed to meet special requirements, giving faster or slower speeds of the same relative ratio.

A Power Rapid Traverse, independent of the feeds, is furnished for the saddle, column and spindle. No two traverses can be engaged together. Power rapid traverse and the feeds cannot be engaged together, and automatic limit stops are provided for every traverse in every direction.

Safety Devices.—Friction clutches are used in the vertical high speed shaft and also for engaging power feeds. While these are positive up to their designed capacity, they provide yielding points when properly adjusted to prevent mechanism being damaged, otherwise all feeds are positive.



Automatic Safety Knockouts or Stops are provided for the saddle, column and spindle at extreme positions, insuring protection against accidents or damage.

No two feeds, or speeds can be engaged together, neither can power rapid traverse in different directions be thrown in, nor engaged till feeds are disengaged.

SLOCOMB MICROMETER CASE.

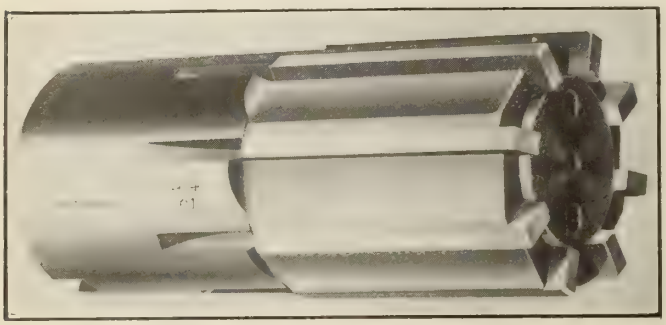
All gears and moving parts are enclosed and fully protected. A self-oiling system provides lubrication for the driving and feeding mechanism of the machine.

FLOOR TYPE BORING, MILLING, TAPPING AND DRILLING MACHINE.

SLOCOMB MICROMETER CASE.

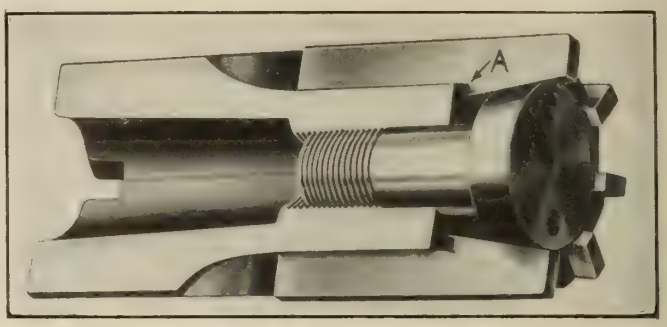
AN improved form of micrometer case has recently been brought out by the J. T. Slocomb Co., Providence, R.I., the well-known makers of micrometers and small tools.

As may be seen from the accompanying illustration, the new case is shaped somewhat after the model of a smoker's pipe case, but is free from the fault, often found in previous micrometer cases, of being too bulky to be conveniently carried in the pocket. The maximum dimensions of the case under review are only 5¼x2¼x⅞ inches—a very handy size. In other respects it differs but little from previous types, being covered with morocco leather and lined with velvet.



U.S.A. FREE ENGINEERING IMPORTS.

THE announcement that engines and other main auxiliary machinery of ships would be imported free under the Panama Canal Law having called forth vigorous protests from the shipbuilding interests, the Treasury Department of the U.S.A., states that only materials for the construction of machinery will be entitled to this privilege.



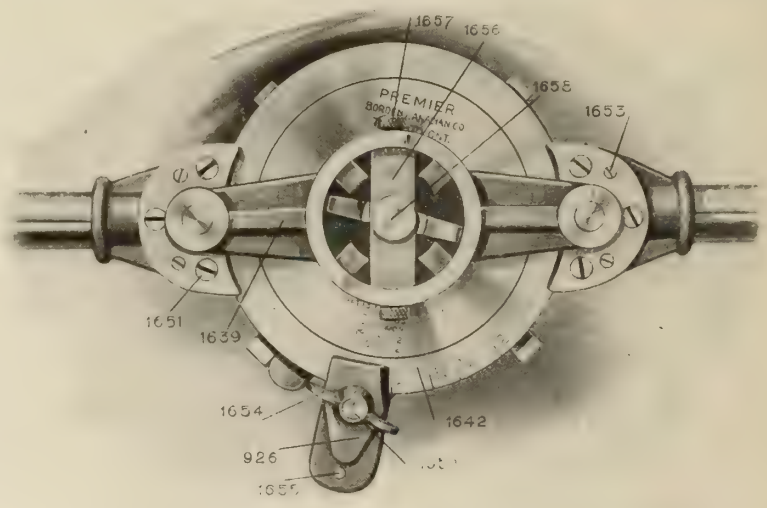
ACME EXPANDING REAMER.

HEREWITH is illustrated the "Acme" expanding reamer lately brought out by the Schellenbach-Hunt Tool Co., Cincinnati, Ohio.

The body is of steel while the blades are of high-speed steel. These reamers are made in a large number of sizes with the expansion varying from 0.040-in. to 0.125-in. The expanding feature is intended to maintain the initial size of the reamer, and not to ream undersize or oversize holes. The blades expand their entire length, but from the form of construction the greatest expansion is at the outer end where the wear is greatest. The blades extend beyond the body of the reamer and beyond the expanding bolt, thus enabling the tool to ream square to the end of a blind hole or to the face of a lathe chuck. Blades are unevenly spaced and are made a tight frictional fit in the body. They cannot be forced back from the set position by end pressure, owing to the shoulder on their under-side abutting squarely against the face of the counter-bored wall as shown at (A) in Fig. 2. The design of the bodies leaves ample chip space and the blades are made interchangeable, enabling them to be quickly replaced from stock.

ACME EXPANDING REAMER.

SECTION OF ACME REAMER.



A NEW CANADIAN DIE STOCK.

THE Borden-Canadian Company, Toronto, report a gratifying increase of business during 1912, their shop having been taxed to its utmost capacity. The company have within the past six weeks put upon the market a new die stock of their own design, which is meeting with a very favorable reception. This has been named the "Premier," and is of the automatic release type; so that as soon as the dies have advanced sufficiently far on to the pipe to complete a standard (Briggs) length of thread, they release themselves from the work and the tool is removed without the necessity of running it back over the threads. Much valuable time is thus saved and all risk of damage to the dies or thread is entirely avoided.

Another feature of the Premier die stock is the absence of the usual leader screw, the function of which is in this tool performed by the dies themselves. The latter are of a special patented form made in two steps. The first set of teeth start the thread and draw the die stock forward on the pipe, while the second set cut the full thread, the taper being obtained by the automatically expanding movement given the dies as they advance on the pipe. The absence of a leader screw enables the die stock to be made much shorter than usual, so that it is possible to thread a nipple 5½ inches long without the use of a nipple holder.

The centering device is very simple. It consists of a scroll cam, without locks, which operates three jaws that guide the die stock on the pipe. No loose bushings are used. The stock, with one set of dies, will thread pipe 1 inch to 2 inches in diameter, either right or left hand thread. This is accomplished by having the dies chased for R.H. thread at one end and for L.H. thread at the other, and reversing them as required. By the use of one extra set of dies, the same stock will thread any pipe from ½ inch to 2 inches inclusive; while by the use of special dies, bolts, etc., may be threaded. This is one of the advantages of the absence of a leader screw, which would, of course, render impossible the threading of any screw differing in pitch from the leader.

The Premier die stock is well designed and strongly made. All parts are of steel, including the body, which is a steel casting. The use of this material enables a considerable amount of metal to be omitted around the circumference of the body, thus reducing weight and greatly facilitating the oiling of the dies. The automatic throw-off can be quickly removed when it is desired to cut straight and running lock nut threads.

BORDEN-CANADIAN CO. NEW "PREMIER" DIE STOCK.

NEW SQUARE CAN DOUBLE SEAMER.

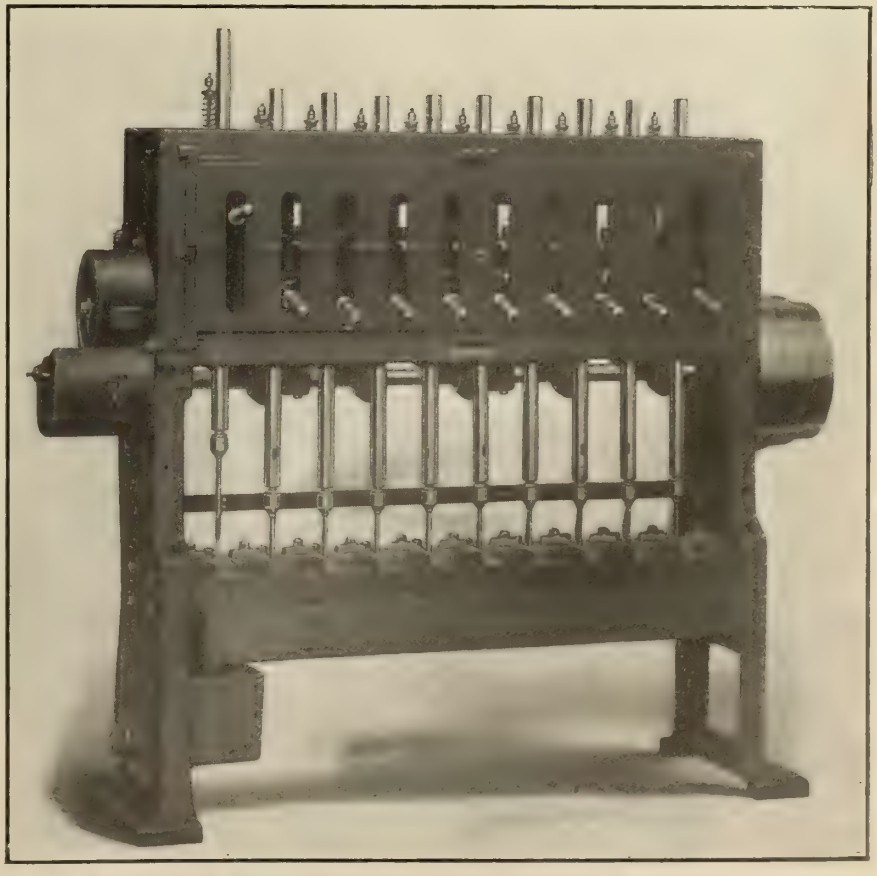
THE new automatic double seamer shown, has recently been designed and built by the E. W. Bliss Co., Brooklyn, N.Y. It is adapted for square, oval and oblong work, handling cans from ¾ to 5½ inches across corners from 1 to 10 inches in height. The rate of production depends somewhat on the size of the can and expertness of operator, varying from 12,000 to 20,000 ends in 10 hours. The machine is driven by an automatic friction clutch encased in the two step driving cone. A hand brake

arranged on the end of the driving shaft automatically engages and relieves after the work is done, and insures the spindle stopping in exactly the same position after every cycle. It will be noted that the lower spindle drive is positive, starting and stopping in unison with the upper spindle. This insures a perfectly straight body after double seaming.

NEW SQUARE DOUBLE CAN SEAMER.

All movements are automatic, leaving the operator nothing to do but place the can on the chuck and depress the treadle, which causes the lower spindle to rise and engages the clutch, starting the driving shaft connected to the chuck spindle by bevel gears, also bringing into action the double seaming rolls. The can is automatically revolved the requisite number of times, the double seamer rolls, after going through their motions, are automatically retired, the clutch is automatically disengaged, the chuck stopped, the lower plate dropped and the can released. The weight of the machine is 1,100 lbs.

TEN SPINDLE SEMI-AUTOMATIC NUT TAPPING MACHINE.



THE National Machinery Co., Tiffin, Ohio, originators of modern bolt and nut forging machinery have perfected and placed upon the market a new 1½ inch Ten Spindle Semi-Automatic Nut Tapping Machine which is shown in our illustration. This tapper is on the same general lines as the 1 inch Six-Spindle Semi-Automatic Machine which was illustrated in these columns previously; although the present tapper embodies improvements, being now equipped with a rapid change gear box which enables changes to be effected in the revolutions of the tapping spindles, for raising and lowering, to correspond to the number of threads on the tap being used. Previously, these changes were effected by removal and substitution of gears, which consumed considerable time, and militated against frequent change. With this rapid gear change box, the spindle revolutions can be altered by merely shifting a hand lever, and this, while the machine is running. The ease with which changes can be effected prompts the operator to reduce the spindle revolutions as the taps are ground and the cutting teeth reduced in number, so that there is little or no idle tapping time—taps running free in the nut after it is tapped.

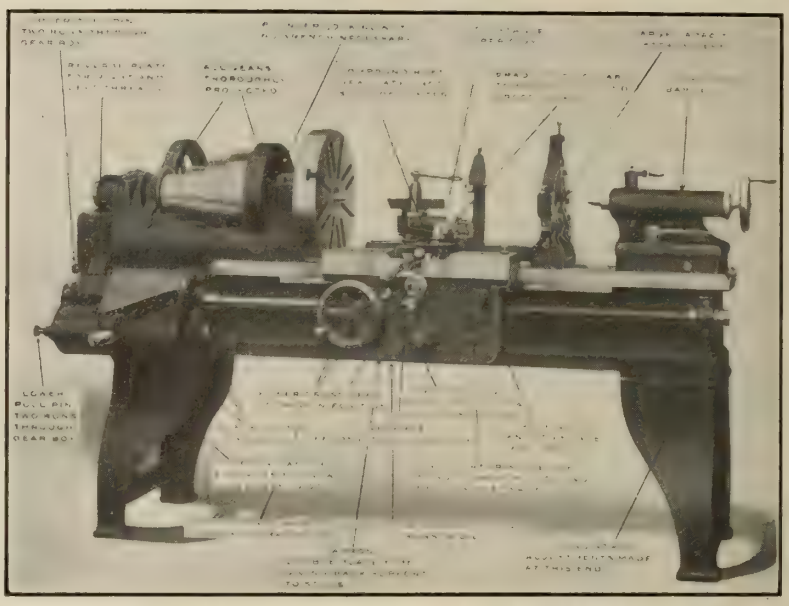
In this semi-automatic type of tapper, the spindles are raised and lowered by cams. Through this automatic spindle movement, the machine "sets the pace" for the operator, and the operator is relieved entirely from treadling, as on the "foot lever" type of tapper; consequently he is not subjected to the attendant fatigue, and can devote his entire energy to feeding. Exhaustive trials have demonstrated that operators have no trouble meeting the uniform pace set by the machine throughout a working day, and that on this machine it is possible to secure large outputs.

The raising and lowering of the spindles by cams also tends to prolong the life of the taps. In foot-lever tappers it frequently occurs that the operator, through fatigue or negligence, allows the spindle to drop,, causing the tap to jam in the nut and bind, and frequently twist off or strip the teeth. This is overcome in the semi-automatic design, as the spindle descends gradually, and the tap is not subjected to sudden and excessive torsional strains.

The cams which raise and lower the spindles have three steps, and by shifting the cam shaft, the resting time of the spindles when raised can be altered to meet the needs of the operator for feeding. The spindles in this design are close together—which is a decided advantage, as it facilitates feeding, and enables the operator to successfully handle ten spindles without covering much floor space. The machine has sufficient range and power to tap two nuts of the smaller sizes on all spindles simultaneously, hence enabling outputs to be still further increased.

The nut holders on these machines are of novel and simple design. The nut guides are chilled plates of wedge shape, held in position by toe clamps. The guides are backed by stationary lugs of corresponding angle on the feed table, thus making the guides extremely rigid, and insuring, also, parallel positions of the guide faces, as they are clamped rigidly against the stationary lugs. The guides have no tendency to shift or spring, and there is, therefore, freedom from binding of the nuts when feeding. Openings are provided in the

10 SPINDLE SEMI-AUTOMATIC NUT TAPPING MACHINE.

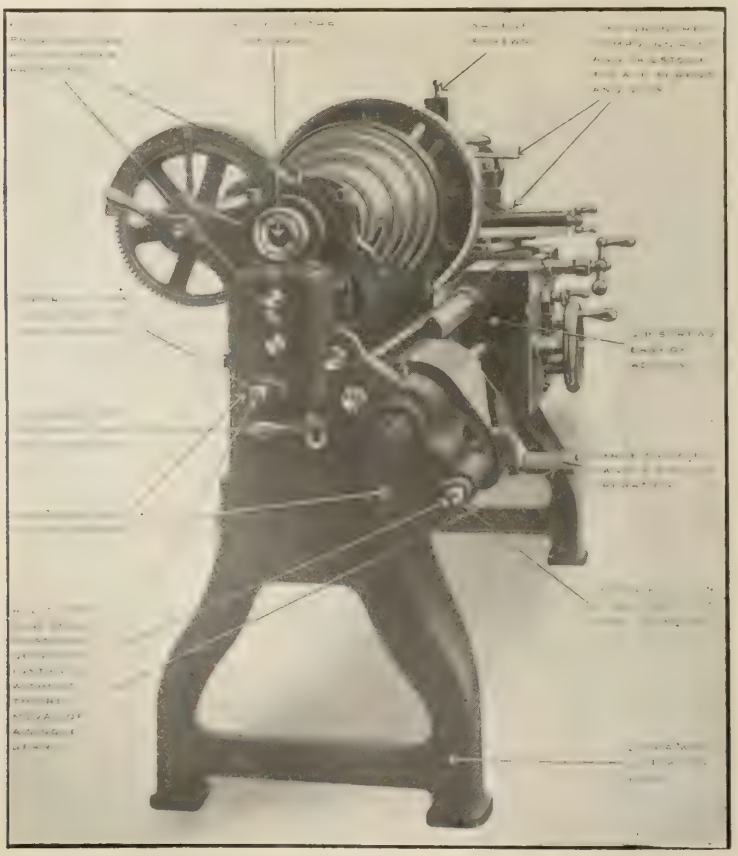


nut pans through which the operator can empty the taps into boxes or kegs set underneath. This tapper will handle either rough hot pressed, or cold punched nuts.

NEW 16-IN. ENGINE LATHE.

THE 16-in. "Cisco" engine lathe shown herewith is an excellent example of the work turned out by the Cincinnati Iron and Steel Company and has as its leading features, strength, durability and simplicity. These lathes are all manufactured by means of a complete equipment of tools, jigs and gauges, ensuring perfect interchangeability between like parts. Only two wrenches, those seen on the tool post and tailstock, are required on the entire lathe, every nut fitting one or the other of these. Careful attention has been given to lubrication of all bearings, and all gears are enclosed.

Screw threads from 3 to 64 per inch can be cut, and only two levers are required for the entire change in threads or feeds, these being made without having to change the gears. The lead screw is reversed at the head of the lathe and a safety device is provided between it and the feeds, making it impossible to engage both at once. When the screw is disengaged from the apron, the half nuts are automatically locked, thus preventing all possibility of their accidentally engaging with the screw.



The apron is of the double plate type, but has as few working parts as is consistent with sound design. All non-essentials have been carefully eliminated. The feeds are obtained by means of a multiple pitch steel worm and bronze worm wheel running in oil.

FRONT VIEW.—16-INCH "CISCO" ENGINE LATHE.

Longitudinal and cross feeds are independent, but are both obtained through the same friction, and can be reversed in the apron. The cross feed and top slide screws are both provided with micrometer graduations, and the swivel slide is graduated on each side. The headstock spindle is made from .50 carbon spindle steel and runs in phospor bronze bearings of liberal size. The carriage is of heavy construction with long bearings on the ways and a wide bridge. All carriages are jig drilled on the back to allow of a taper attachment being added at any future time.

Our illustrations show a lathe with a 6 ft. bed, but any length can be supplied advancing by 2-ft. units. The net weight of the lathe shown is 2,350 lbs., and the floor space occupied by it is 7 ft. 6 in. by 3 ft.

END VIEW—16-INCH "CISCO" ENGINE LATHE.

MORROW CHUCK RIGHTS SOLD.

Morrow Drill Chucks are now manufactured by the E. Horton & Son Co., of Windsor Locks, Conn. The latter company, after studying the problem of producing a thoroughly reliable and efficient ball bearing chuck, and comparing all designs, decided that the Morrow Drill Chuck was of such design that it could be depended on under all conditions. They secured the Morrow Chuck, with all patents, equipment and tools, and transferred them complete to their plant at Windsor Locks.

It is hand operated, without the use of keys, spanner or wrench. Perfect alignment of all parts on plain bearings, large ball-bearing to take end thrust, automatic positive grip that never slips, and quick unresisting release by hand are features claimed for this chuck.

Mr. H. V. Hamilton has resigned his position as assistant sales manager with the Steel Co.. of Canada, having accepted the post of sales manager to the Canada Steel Company, Hamilton, Ont.

THE APPRENTICE ENGINEER.

MR. SUMMERS HUNTER, in a recent address, said:—In an engineering works the apprentices appear to be divided into two classes, those who take advantage of all the facilities we can give them, and who work conscientiously in the shops and out of them—thus we get a small proportion of clever young fellows who will undoubtedly rise to all that is required in the future. Then there is the other class, who will eventually become our skilled workmen. We must give our attention to all, because it is just as necessary to have thoroughly skilled and well-trained workmen as it is to have the more highly educated, a number of whom will take more responsible positions.

I have apprentices in our works now who came from schools, where, at the age of 15 or so, they go on the science and engineering side for three years. At the age of 18 or 19 these lads are well grounded in science. They have had experience in the running and testing of steam engines, gas and oil engines, turbines, electrical apparatus, and even a certain amount of practical training under skilled workmen. Personally, I have got the best results from the lads who, after leaving school, go into the shops for a year, and after that divide their time between technical colleges and the works. Of course, this is a system that cannot be applied to the ordinary apprentice; at the same time, ordinary apprentices can take advantage of the system by qualifying at evening classes. I believe six months in the works and six months at college for three or four years would be found, on the whole, to give the best results. I am dealing now with mechanical engineering as quite apart from civil.

For the majority of apprentices who have to learn a specific trade, I believe more can be done in the future than we have attempted in the past. I have found a certain percentage of apprentices quite deserving of special education or training in practical work, and in the future I shall give more attention to this, for more accuracy is being called for, and we must produce skillful workmen who can make the best and most methodical use of the machinery and apparatus in the works. I have the greatest admiration for the mechanic who is able to turn his hand to any job about an engine, but as with the leaders, so with the workmen, men of special training will be required.

LOCOMOTIVE BLAST PIPE.

A PROPERLY designed variable blast pipe is an acquisition to a locomotive, and if used intelligently, economy and a higher general efficiency in the performance of the engine are the result. According to the **Railway Gazette** an engineer has recently stated that while studying the question of locomotive design and operation abroad, he frequently rode on French locomotives, and noticed particularly the degree of refinement obtained in the steam distribution of four-cylinder compound engines. At speeds of from 56 to 62 miles an hour it was noticed that by a slight adjustment of the valve gear, which resulted in lowering the back pressure on the low-pressure pistons, the engine immediately increased its speed by about nine miles per hour, without taking any more steam from the boiler or increasing the regulator opening. The same engineer has also expressed the opinion that superheated locomotives would give an even higher efficiency than they do at present if fitted with variable blast pipe nozzles, and that wherever four-cylinder compounding is resorted to, there should of a certainty be an independent adjustment possible between the high-pressure and low-pressure valve gears.

THE UTILIZATION OF PEAT.

A report issued by the Canadian Department of Mines, deals exhaustively with the utilization of peat fuel for the production of power and with experiments conducted at the Fuel Testing Station, Ottawa, the results of which are given in numerous tables and curves. The report consists of about 140 pages, and is divided into two sections. The first section refers to the plant employed, consisting mainly of a 60 h.p. double-zone Korting gas producer, with wet coke scrubber, tar filter and dry scrubber, a Westinghouse 100-h.p. bituminous suction-gas producer, and a 60-h.p. four-cycle, single-acting Korting gas engine, coupled direct to a 50-kw. Westinghouse generator.

New Tar Separator.

The second section contains a description of alterations carried out in the plant in order to eliminate difficulties connected with the formation of tar. These alterations were devised by Mr. F. B. Haanel, the compiler of the report, and involved the design of a new tar separator, in which a cone composed of 40-mesh brass wire is used as a filter in place of a cylinder and perforated plate. The gas, in passing upwards through the cone, deposits some of the tar on the metallic surface, and this is washed off by a water spray from the interior of the cone. The particles of tar that escape contact with the metallic surface of the cone in passing through the meshes are caused to coalesce and to form larger drops, which either adhere to the outside surface of the cone or drop to the bottom of the separator, assisted by another water spray on the outside of the cone. The latter spray is connected by a two-way cock to the return cooling water from the gas engine, and should the suction in the separator begin to rise, the hot water is substituted for the cold, and in this manner the suction, whatever it may be, reaches normal in about a minute. This separator is stated to remove completely the troublesome matter from the gas, and to render the plant an unqualified success, so that operations may be carried on for a week or more without having to shut down for the purpose of cleaning the valves of the engine.

The consumption of fuel per b.h.p. hour, including stand-by losses, is, for full load 1.7 lb. of dry peat, or 2.3 lb. when containing 25 per cent. of moisture; and for three-quarter of load, 2.1 lb. of dry peat, or 2.8 lb. with 25 per cent. of moisture. Assuming that the peat can be delivered to the plant at $2 a ton, and that the plant is run with a power factor of 75 per cent. for 3,000 hours, the fuel cost is $8.40 per b.h.p. year, including stand-by losses. The peat employed varies slightly in composition, according to its source, but that taken from Alfred consists of 30 per cent. moisture, and, when dried, of 30 per cent. fixed carbon, 64.6 per cent. volatile matter, and 5.4 per cent. ash. The calorific value of the dry peat is 9,450 B.Th.U. per lb., and as charged 6,600 B.Th.U. Other details of the different qualities tested are also included, as well as numerous photographs, drawings, and diagrams.

ELECTRIC LOCOMOTIVES.

AS applied to electric locomotives, the multiple-unit system makes possible the concentration of very great tractive power, and makes it practicable by giving each locomotive an equal division of load, while requiring only one driver. As applied to motor car trains, the system permits of the application of great power to the axles throughout the train, and permits of the utilization of any desired train weight (up to the limit, when every axle is equipped) for driving adhesion at the rails. It is obvious that this makes possible very high rates of acceleration, and, consequently, high schedule speeds in a service where stops are frequent—such a service as is required in suburban and other local passenger operations.

APPLICATION OF BALL BEARINGS

AN interesting paper entitled "Application of Ball Bearings to Engineering," was recently read before the University of Liverpool Engineering So-

ciety. In dealing with the fitting of ball bearings, the author, Mr. George W. Goodchild, remarked that this is a very easy matter, generally speaking. The inner ring should be driven tight on the shaft, while the outer is a push fit in the housing, and should be allowed some side play.

Before mounting, the bearing should be allowed to lie in a bath of oil heated to about 104 deg. Fah., and then driven on the shaft, which should be a shade larger than the bore of the bearing, by a few good blows directed on the inner ring, carefully avoiding hitting the balls or outer race. This is particularly essential if the loads vary considerably, and when the bearing is subject to constant and considerable vibration, such as in crank shafts and rolling mills. It is also necessary for machines running at high speeds, such as electric motors, ventilators, woodworking machines, etc. It is very desirable that the shaft should be ground where it is proposed to fit a ball bearing; furthermore, the inner race should be clamped tightly on the open side, and it is essential that nuts or other parts holding the inner race in position should not come into touch with either cage or balls.

POWER TRANSMISSION OF BELTS.

THERE are cases when one cannot escape a leather belt. In such an event, don't be guided by the pulley face as to your size of belt. Mr. R. Berry's paper on the transmission of power by belting was discussed before the Birmingham Association of Mechanical Engineers a short time ago, and this is his rule: "Multiply the band speed in feet per minute by the width in inches, the result will be total energy in watts that the band can safely be relied on to transmit.

PASSENGER MOTOR CAR DEADWEIGHT.

SOME interesting comparisons were drawn by the author of a paper read recently before the Canadian Railway Club. Attention was called to the fact that a horse-drawn vehicle, seating on an average four passengers and a driver, weighs from 1,500 lbs. to 2,500 lbs., which gives a deadweight per passenger of from 300 lbs. to 500 lbs. Such a vehicle will move at a speed of from six to eight miles per hour over a road not comparable with the worst type of railway track. Again, a motor car weighing five tons and seating seven passengers and containing its own power plant, moving with almost the same average speed as a passenger train over a far inferior road bed, gives a deadweight per passenger of about 1,428 lbs. The deadweight per passenger of a steel railway coach built after American ideas varies from 1,200 lbs to 1,700 lbs., and admitting the points of superior comfort and safety to be balanced by the poor road bed and the weight of the power plant of the motor car, the question arises as to whether any possibility exists of getting below the motor car limits of deadweight per passenger, and is this reduction possible without sacrificing safety and comfort?

THE ELECTRIC TRUCK.

By L. Ruprecht, M. E.

THE motor truck has made wonderful strides in the past two years. There is scarcely a line of business which has not adopted, at least in part, the horseless vehicle. There are, generally speaking, two types of motor trucks, gasoline and electric. Each type has its particular field, largely because one is more economical in one field than the other. The electric is the city and the suburban truck, while its running mate produces greater dividends in long haul work where few stops and a high rate of speed is desirable. As its title indicates, this paper concerns itself principally with the electric truck, and in common with other electrical apparatus, the early electric truck had an uphill fight. People couldn't or wouldn't understand how it should be cared for, and the result was that a great many pioneer users were dissatisfied, in spite of its simplicity and in spite of the fact that these old trucks are running to-day. They were naturally dissatisfied with their first gasoline touring car with its mysterious complications, but that, as a luxury, was not expected to produce dividends on the investment. The electric truck was expected to, and rightly handled, it finally did.

Durability, Efficiency, Dependability.

The durability, efficiency and dependability of the well-built electric truck is now thoroughly established. There are scores of such trucks in service, which are over ten years old; several thousand that are from three to eight years old, all doing good work. You may have noticed some of these old veterans running about our streets, and they deliver the goods in all kinds of weather at much less cost and with greater despatch than horses.

We all like to make fun of the "one-lunger," but we should not forget that without the first crude model we could never have the perfected machine. It is these "old veterans" running about New York for ten years that have given the electric truck such a boost—that has enabled one manufacturer to put 1,075 electric trucks on these New York streets, principally in the past two years, and 490 heavy electrics into the service of 49 brewers. A business man has but to look at the early model and then at the 1912 product to see the evolution of the electric, and to understand why the pioneer buyers of electrics are putting in "fleets" of from 20 to 150 such trucks.

Universality of Service.

The electric truck is purchased in large quantities by leading merchants, manufacturers and express companies, because, for their work, it is the best paying investment they can make in power wagons. There will, however, always be work that the horse can do to better advantage than the motor truck. You must keep your motor truck busy a large part of the working day in order to get your money back, just as you expect to do with other machinery.

It is generally recognized that 80 per cent. of all average city trucking and deliveries can be most economically and efficiently handled by the electric truck or wagon, and in the matter of cost of operation and upkeep, the electric truck has certain fundamental advantages. In the matter of "fuel" it has a great advantage. Electrics are charged at night when there is little market for current which the power station must "grind out," as it were, regardless of selling it. That's why an electric truck customer gets a rate of from three cents to five cents, or less than half what he pays for his residence lighting. Electric current at four cents is equal to gasoline at ten cents, but gasoline is retailing at sixteen to twenty cents. Electricity is getting cheaper, gasoline prices are advancing. Then, too, the electric truck will last ten years, which means an annual depreciation of 10 per cent., against 20 per cent., or even 33 1-3 per cent. for the non-electric truck. The somewhat slower, consistent speed of the electric means less vibration, less tire expense (the largest single item of upkeep expense), and naturally longer life, and this slower speed, combined with simplicity of control, reduces liability to a minimum. Again, the simplicity of the electric enables a firm to break in regular teamsters, familiar with your conditions, as operators. A driver at $12.00 or $16.00, against a chauffeur at $20.00 or $25.00 a week, is an item of difference of $400 per year in itself. Mention should also be made of about 40 per cent. saved on garage insurance with the electric truck. The advantages just cited are fundamental facts. Your work may require a gas truck regardless of its higher operation and maintenance cost, but if the electric can do the work you certainly have a dozen good dollars-and-cents reasons for buying it.

Electric Truck Mileage.

Electric truck mileages have come in for some criticism in years past, but those who use hundreds of these machines are better judges of what constitutes a good day's work than outsiders. A five-ton electric truck has a mileage of from 35 to 45 miles on a single charge of the battery. The speed is usually seven miles per hour, or over twice the average speed of heavy draft horses, and requires no rest. It is always possible to get 50 to 60 miles per day if you really need it. You can take a "boost" at noon or at one end of a run, or you can equip with extra batteries if more than eight hours' work a day is demanded. Current for a full charge costs, at four cents, an average of $1.25.

Bear in mind particularly that investment in electric truck equipment and garage is very little greater, if not less, than the investment in horse equipment and stable of equal work capacity, and that is so whether your equipment is all electric or mixed electric and horse, or mixed gasoline, electric and horse. The investment when intelligently made pays bigger dividends than most modern machinery and, last but not least, motor trucks will extend your business area. In the heat of the summer, when horses are dropping by the thousands, the electric is there with the goods. You can work it 20 hours a day if necessary, instead of every other day as you do your horses. It is not uncommon for a good electric to work every working day in the year, and I need not remind you that the depreciation of city horses increases each year. A dead horse is a total loss, whether from sunstroke, broken legs or disease. This is an electrical age and the electric truck is part of modern progress. With practically all lines of industry about you adopting it, you cannot afford to lag behind. From a paper read before the Annual Convention of the Eastern Ice Association, New York, November, 1912.

PETROL, STEAM OR HORSE.

AN interview appears in The Commercial Motor on motor versus horse haulage, with the managing director of a large London brewery, which acquired 12 steam vehicles before the end of 1906, and two years later began to buy petrol vehicles, of which they now possess 12, of carrying capacities from 30 cwt. to 5 tons. They have also 150 horses. "We have found that there is work for both horse and motor; but cannot shut our eyes to the economies that have been effected by the use of the motor. Compared with hiring charges they are cheaper by a full 50 per cent. Our own stable can, of course, work more economically than when we hire, but the motors will undoubtedly show a big saving over horses in a considerable additional portion of our work when we are able to change."

Petrol vehicles are preferred to steamers because they give a wider range of operation, although they have the disadvantage of greater tyre wear; but in tyre wear, the company have effected economy by fitting larger tyres than those supplied by the makers. On relative costs of running, the petrol vehicle was 50 per cent. higher than the steamer, but it gave approximately 33 per cent. more in mileage, while being cleaner in the yard and free from smoking on customers' premises. Any further decided increase of liquid fuel cost would tend to send the company into the hands of the steam vehicle makers. Meanwhile they are in search of petrol substitutes such as paraffin, benzol, or other. In comparative cost of horse and motor delivery, before the adoption of motor vehicles, the cost per barrel per mile seldom came below six cents, and with motor vehicles never exceeds 2 cents.

LABOR DISPUTES DURING DECEMBER, 1912.

THERE was a marked decrease in the number of labor disputes in existence in Canada during December as compared with the preceding month. The Department of Labor's record of strikes and lockouts shows there were thirteen labor disputes in December, and while this number is greater by 5 than that of the corresponding period of last year, it represents only about half as many as were in existence in November, when 25 were reported to the Department of Labor. The important disputes in existence were those of coal miners on Vancouver Island, miners at Porcupine, and freight clerks, etc., on the Canadian Pacific Railway, all of which commenced before December and continued throughout that month. About 3,500 employees were affected by disputes in December, 1912, compared with 3,900 in November, 1912.

The Department's index number of wholesale prices rose slightly during December, standing at 135.2 as compared with 134.8 in November and 129.4 in December, 1911. Commodities advanced slightly in nearly all groups, the only decline of importance being in grains and fodders. In retail prices the upward movement was not as strong as during the past few months, nor at the corresponding period of 1911, meats and dairy products being steadier.

According to the record of industrial accidents maintained by the Department, 97 workmen were killed and 357 injured during the month of December, 1912, as compared with 114 killed and 359 injured during November. The greatest number of fatal accidents occurred in steam railway service, building trades and navigation, the figures being 20, 17 and 12, respectively.

WROUGHT IRON REVIVAL.

THE Staffordshire Iron and Steel Institute held its opening meeting at Dudley recently, and discussed the largely extending use of Staffordshire wrought iron. When Bessemer steel was introduced, it was thought that wrought iron would be displaced. Lately, orders for thousands of railway wagons have been given, in which iron underframes have been specified in substitution for steel. Iron sheets are largely preferred to steel because of their resistance to corrosion. The merits of wrought iron and the need of improving its production, especially by a good mechanical puddling furnace, were set out in a paper by Mr. Herbert Pilkington. A letter was also read from Professor Turner pointing out the value of the local iron industry, and estimating a total output for 1912 in the district of over a million tons. Ten thousand persons in the Black Country, employed by 32 firms, were making wrought iron, while there were 661 puddling and 296 mill furnaces, every one working to its full capacity, and additional furnaces being erected. That was due partly to general good trade, and partly to recognition that the special properties of wrought iron justified rather higher prices for it than for mild steel. South Staffordshire was still the chief wrought iron producing centre in the United Kingdom.

In the discussion, the necessity was recognized of a good mechanical puddling furnace. Men are scarce and something must needs be done to attract puddlers into the trade. Several speakers complained of the insistence by engineers on the reduction of area test, which might be good for steel, but was of no good for wrought iron. Mr. Pilkington strongly commended the admiralty test for cable chains, which insisted on a good fibre, but took no acount of reduction of area.

"WHAT I BELIEVE."

I BELIEVE that progress only means more light. That in the world today electricity leads the van of progress, and is the greatest agent for doing the greatest amount of good to the greatest number of people. That in advocating the use of electrical service I am helping to make life more cheerful, hopeful, healthful and useful."

DRY BLAST REFRIGERATION.

A NEW method of drying the air for blast furnaces by the aid of mechanical refrigeration has been perfected and is being introduced by the inventor, Charles H. Leinert, Chicago, Ill., says "Ice and Refrigeration." As an evidence of the merit of his apparatus, the inventor states that contracts have been concluded with representatives of the Krupp gun works, Essen, Germany, for installation of plants at two of their blast furnaces, with option for control of the system in Germany if practical operation proves the method to be as effective and economical as is claimed. The Illinois Steel Co., South Chicago, Ill., has secured the right to use the system for its blast furnaces. Patents covering the method and system of application have been granted in the United States, Germany, Austria, France and Luxemburg.

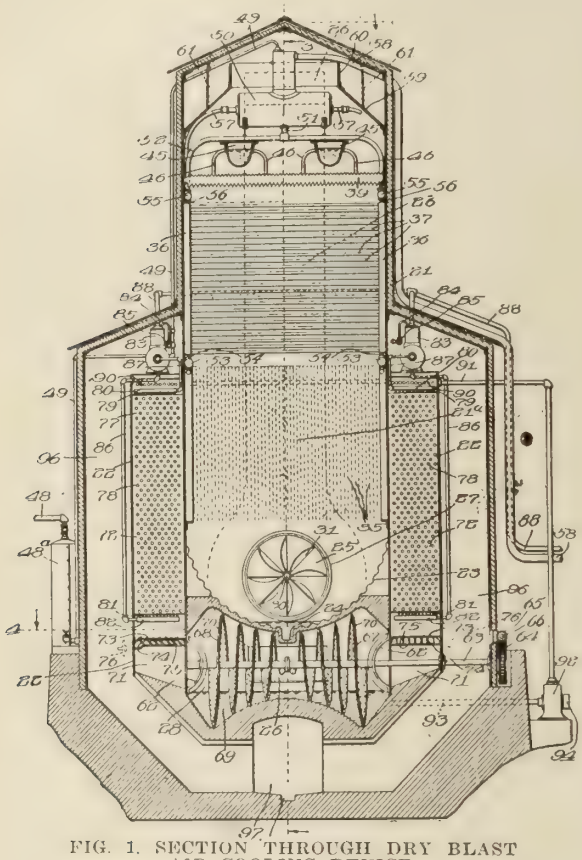


FIG. 1. SECTION THROUGH DRY BLAST AIR COOLING DEVICE.

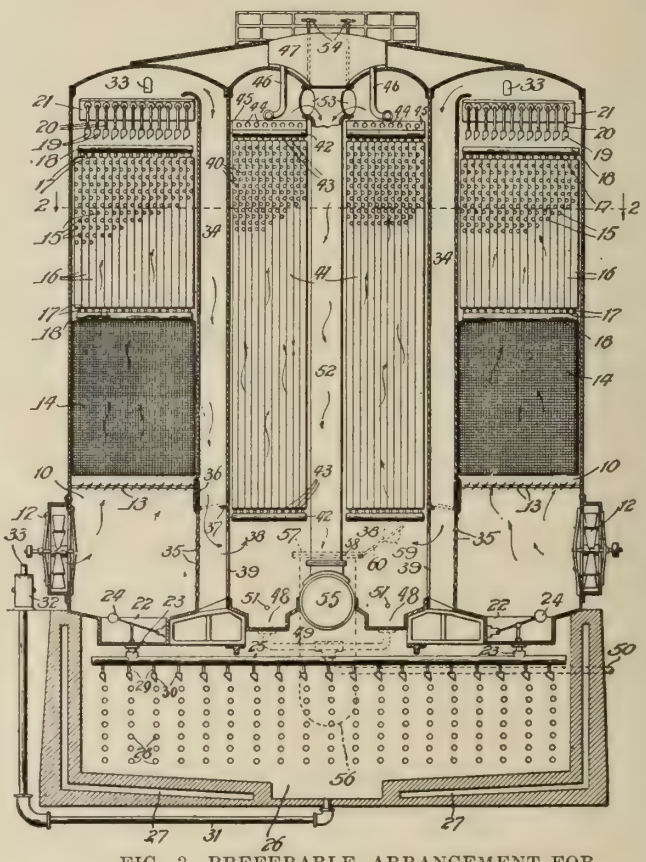

FIG. 2. PREFERABLE ARRANGEMENT FOR AIR DRYING SERVICE.

In this new system, the air intended for the blast furnaces is first introduced into a cooling tower by means of rotary fans which force it upwardly through a spray of water trickling over screens or chains; the water having been previously chilled by passage over ammonia pipes or overflowing from a tank in which direct expansion pipes are immersed. The spray serves to remove mechanical impurities, such as soot, etc., cools the air to about the temperature of the water and robs it of a large portion of its moisture content.

From this preliminary cooler and dryer, the air passes through a passage at base of the cooling tower in which a spiral, made with expanded metal or similar material, rotates. This passage, or chamber contains in its lower part a concentrated solution of calcium chloride or other deliquescent re-agent which adheres to the surface of the expanded metal as it rotates, and thus further dries the air to about two grains per cubic foot, during its passage through the spirals. Two spirals are used, as may be noted in the illustration and these revolve in opposite directions. Air admission is at the centre, the revolutions of the spirals driving it to either side.

Leaving this chamber, the air passes upwardly through a pair of chambers containing a large number of direct expansion pipes in which liquefied refrigerant, such as anhydrous ammonia, expands. As the air is already robbed of much of its moisture, comparatively little remains to be deposited in the shape of frost upon these pipes, and this deposit is prevented by causing a thin film of calcium chloride brine to trickle down over the pipes. By its passage over these, the air is deprived of its moisture to within one or one and a half grains per cubic foot. From this final drier the air passes into the intake pipe of the blowing engines and thence to the blast furnace stoves where it is heated to about 1,500 degs. F., ere it is admitted in to the blast furnace.

The cooling tower, it is asserted, occupies much less space than the air drying plant heretofore used, and can be located conveniently on the roof of the building containing the blowing engines, or otherwise in close proximity to same. It is more economical to carry the liquefied ammonia to the tower than to conduct the very much greater bulk of air from the refrigerating plant to the blowing engines. Moreover, there is no stoppage of any part of the apparatus for the removal of frost accumulation on pipes.

The water which trickles through the preliminary drying chamber collects in the bottom of same, and is pumped back to the troughs in the upper part of the chamber, or to the tank fitted with ammonia coils. As additional water is condensed from the air passing through this chamber, the surplus water is conducted through suitable pipes to the ammonia condensers, and on account of its low temperature, effects a considerable saving in the operation of the condenser.

Modified Method Apparatus.

A modification of the method and apparatus for air blast drying by means of refrigeration is illustrated in Fig. 2.

By the arrangement there shown, the penetration of outside heat to the final cooling chambers is effectually prevented by placing these at the centre, and placing the preliminary coolers and air purifiers at the sides. Referring to Fig. 2, air is driven into the preliminary cooling chambers (10), by means of rotary fans (12). Above the air chambers are a series of screens, or chain plates (14), which serve to sub-divide the cold water descending from above, so that as large a surface of water as possible is exposed to the action of the air which passes upwardly. Above the screens are a series of pipes (15), connected with vertical pipes (16), which are in turn connected with horizontal headers (18). The headers (18) and pipes (16) may be supplied with liquid ammonia, cooling the pipes (15), over which the down-pouring stream of water from troughs (19) and tank (21) flows. The water thus pouring down through the cooling tower is collected in a cement water reservoir (26), below the cooling tower. This reservoir is provided with pipes containing liquefied ammonia, over which the water is sprayed through troughs (30) from pipe (25). The water thus cooled is drawn off through pipe (31) by pump (32) which returns the water to top of cooling tower to be used over again.

The air leaving cooling tower at top, as indicated by the arrows, flows down the passages (34), and enters the final cooling chambers (38) at bottom through opening (39). These cooling chambers are supplied with direct expansion piping (40) (41) and horizontal headers (42). Just above the headers are pipes (44) (46) communicating with tank (47), containing calcium chloride brine, which, passing through slits in pipe (44), falls in a thin film over pipes (40) and prevents the accumulation of frost on said pipes. The Ca.Cl. brine collects in troughs at bottom of chamber, and through pipes (49) and (50) is pumped back to tank (47). An overflow (51) serves to lead the calcium chloride to a concentrator when the solution becomes too dilute. Regulators are provided for controlling the flow of the cold dry air from final coolers to blowing engines, to which it passes through pipe (55) and blowing engine intake (56).

Suitable provision is made for cutting out the preliminary cooling tower when desired, for which purpose, louvres (35) are placed in wall of preliminary cooling chamber, the opening of which sends the air directly to the interior final air coolers. Thus, when the outside temperature is above 40 degs. F., the air is passed through both preliminary and final coolers. If temperature is between 20 and 40 degs. F., the air is passed only through final cooling chambers, and if outside temperature is below 20 degs. F., the cooling tower is entirely cut out and air admitted directly to intake of blowing engines. Broadly speaking, the novelty in this new method consists in the use of preliminary cooling, and final cooling and drying means.

UNITED KINGDOM EXPORTS TO CANADA IN 1912.

FIFTY-THREE THOUSAND loads of hewn wood and 895,000 loads of dressed wood were exported from Canada to the United Kingdom. Exports from the latter to Canada include:

	Tons, 1912.	Tons, 1911.
Pig iron	68,024	91,024
Wrought iron	6,563	8,748
Rails	737	1,739
Boiler plates	2,801	6,696
Galvanized sheets	26,248	22,476
Tinned plates	7,039	12,426
Steel bars and shapes	14,276	28,259

The value of the further exports were as follows:

Cutlery	$ 599,400	$ 515,500
Hardware	585,980	516,040
Carpets	2,250,595	1,850,755
Haberdashery	886,615	703,410
Linen piece goods	1,733,260	1,400,575
Waterproof apparel	1,111,815	503,510
Glass and earthenware	2,342,315	1,975,620
Writing paper	74,305	112,985
Printing paper	733,780	648,660

WOOD BLOCK FLOORS.

ONE of the very best types of floor, incidentally rather an expensive floor, is the creosote or hardwood block laid end-grain. The Aberthaw Construction Co., of Boston, in a recent investigation, found that several paper mills have used these with considerable success. The floor has the advantage of resisting water conditions, of standing up under the hardest trucking, of being a resilient, noiseless floor and one which can be kept very clean. For practical use in this country, creosoted blocks are most commonly used. Where these are laid on a concrete floor, the best practice is to dip them in tar and stick them down to the floor, then grout between the blocks with cement. A 3-inch block has sufficient depth.

BRITISH OR "EMPIRE MADE."

THE text of the Merchandise Marks Act, which was recently introduced in the British House of Commons, and which seeks to amend the law as to trade marks and descriptions, is now published. The measure provides that all goods bearing description liable to make the purchasers believe that they have been manufactured within the British Islands shall be marked with the word "British." They shall be marked "Empire-made" if manufactured in any part of the British Empire outside of the British Islands, or with the words "Not British" if manufactured outside of the British Empire. All goods marked "British" and "Empire-made" in accordance with this provision are to be accompanied by a sworn declaration before a commissioner for taking of oaths that the goods were manufactured within the British Empire.

BRITAIN'S TRADE INCREASES.

RECORD increases in the trade of the United Kingdom of Great Britain and Ireland are shown by the Board of Trade figures for the year ending December, 1912.

With total imports of approximately $3,724,482,570 and total exports of $2,437,170,010 the aggregate increase reaches the enormous sum of $490,268,455. The respective increases were: In imports, $323,694,935 and in exports $166,573,520.

Grain and flour account for upwards of $60,000,000 of this increase in imports, and other food for nearly $20,000,000. Tobacco is responsible for $5,000,000 increase, cotton from America for $32,500,000. The principal increase in exports were in iron and steel $50,000,000, coal $20,000,000, and in textiles $10,000,000. The imports of bullion during the year totalled $357,110,385 against exports of $323,621,065.

STEAM AND ELECTRIC DRIVING.

AN investigation carried out in the United States by the Worcester (Mass.) Electric Light Co., in regard to the relative cost of operating a small machine shop by steam and electricity, has shown a saving of $143 yearly in favor of electric driving. Previous to the conversion, a steam boiler and engine, the cost of which was $1,500, supplied an average of 15.3 h.p., and, including wages, fuel, water, interest, depreciation, and repairs, the cost of maintenance was $1,664 a year. In place of this plant, four electric motors of a total of 30 h.p. were installed at a cost of $507, the boiler, which had cost $600, being retained for heating purposes. Including interest, etc., energy, coal for heating, and labor, the cost of operating by mtans of the electric drive amounted to $1,521 a year.

A micrometer used by a Swiss watch company accurately measures parts to the hundreth of a millimeter.

SHIPBUILDING A STAPLE INDUSTRY FOR CANADA.

A FEW days ago, representatives from the leading shipbuilding concerns established in various parts of the Dominion waited on the Premier and laid before him their ideas on the subject of the necessity of Government assistance in propagation of their enterprise. It was pointed out that a restricted sphere of operation was only, meantime, possible on account of the free import of Canadian registered, British built ships. In a word, protection of some effective kind was sought to offset the preponderance of production cost in favor of Great Britain. The extension of the scope of the shipbuilding and marine engineering industry in Canada is generally accepted as but the natural outcome of the progress and development made during recent years, and the expressed desire on the part of her citizens to emulate the achievements of the Motherland, with respect to her own requirements as well as the winning of international maritime renown. As a "Nation within an Empire," no difference of opinion, amounting to anything material, exists relative to duty to ourselves and to the Empire whose nurture and protection has contributed so largely to our present status. Our industrial record continues to expand in well established engineering and manufacturing pursuits concurrently with agricultural and mineral wealth development, and beyond the feature of the protection of our shores, our transportation needs fall to be accounted.

The proposal to aid the Imperial Navy will meet with its strongest support by propagating already established shipbuilding and marine engineering industries, and by furthering an increase in their numbers and scope. Readers of and advertisers in Canadian Machinery have a large interest in this question, for in no one other individual completed product of man's inventive and constructive genius do so many accessory industries live, move and have their being. Shipbuilding and marine engineering embraces within its scope our iron and steel plants, our foundries and our machine shops, and, needless to say, in numerous cases, equipment for these compares on equal footing with the requirements of other sections of the engineering field.

The reported establishment by the United States Steel Corporation of an extensive plant on Canadian territory indicates the drift and trend of iron and steel trade affairs, and although much of the detail already arranged in this and other directions has been accomplished under cover of the increasing requirements of our great railroads, the fact remains that the broader field, consequent on what might almost be called the inception of a new industry, that of shipbuilding and marine engineering, is the goal furnished by the provision being made to meet an early future demand. Again, the extensions to and modernizing of old established steel and iron foundries, machine shops, etc., in all of the leading industrial centres of the Dominion, have for their objective a coming boom time in Canada's trade and commerce, and anticipate, in no uncertain manner, the institution, on a much larger scale than hitherto, of the shipbuilding and marine engineering industry.

Our contemporary, "Marine Engineering of Canada," in an article entitled "Canadian Shipbuilding Development," says "that in view of Canada's offer of three super-dreadnoughts, the keels of which will, however, have to be laid down in the United Kingdom, it is of interest to note that very soon it will be possible to build ships in the Dominion, as, according to all accounts, good progress is being made with the creation of the necessary establishments.

THE VAUCLAIN DRILL.

THIS heavy-feed drill which has lately aroused widespread interest, aims to eliminate many of the inherent defects of the ordinary form of twist drill; and the following, which is taken from a paper read before the American Society of Mechanical Engineers, shows in an analytical manner how the result has been attained.

Speaking generally, there can be no better definition of economical drilling than "rapid drilling"—the saving of time. The fact that a drill will cut at some phenomenal speed, or will consume such and such an amount of power means nothing so far as productive capacity is concerned. The object in view is the removal of chips.

Cutting stress is practically independent of the cutting speed, and with a given feed, is proportional to the lip angle of the cutting edge. The cutting stress does not increase as rapidly as the feed.

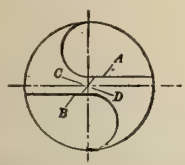

FIG. 1.—COMMON TYPE OF TWIST DRILL.

Since both the stress and heat are influenced by the keenness of the cutting-edge, it is desirable that the lip angle be as small as possible. But it must be blunt enough to carry off the heat and to support the chip pressure, which falls more or less back of the actual cutting edge, according to the depth of the feed. Since the chip is torn, not cut from the work, rupture

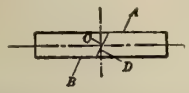

FIG. 2.—COMMON TYPE OF FLAT DRILL.

between work and chip precedes the actual cutting edge. The heavier the feed, the farther back from the cutting edge will its pressure fall upon the tool.

The feed remaining constant, the horsepower consumption will be proportional to the speed. This is true both of the power consumed by the machine and that consumed in cutting. The speed remaining constant, the power consumed in cutting does not increase as rapidly as the feed, and the power consumed by the machine remains constant for all feeds.

From this it will be seen that the most economical method of chip production is by giving preference to the feeds, rather than the speeds. Power, time and drills will be saved thereby.

Figures 1 and 2 illustrate the section scheme of drills now commonly used. While there are many modifications of these, the figures suffice to illustrate their common characteristic, which is that the cutting edges A and B pass to one side of the axis of motion of the drill instead of through the axis. In this respect there is no difference between Figures 1 and 2.

It will be seen that in this scheme the drill has four distinct edges, A, B, C and D, and that the usual name

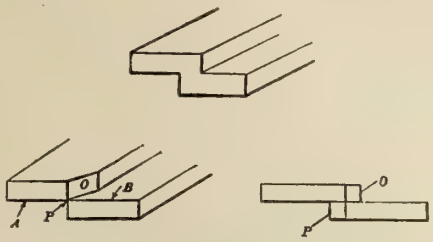

FIG. 3.—PRINCIPLES OF VAUCLAIN DRILL.

given to it of "two-lip" drill is not correctly applied.

It is cusomary for the included angle E to be of 118 deg. and the cutting edges C and D, Figures 1 and 2, therefore have an unfavorable lip angle. These edges constitute what is commonly called the chisel point and their resistance is very great. The cutting edges A and B cut more freely than the cutting edges C and D and a tendency to longitudinal fracture of the drill is set up thereby. This is the cause of the splitting of drills.

In the commonly used types of drills there are but two methods of reducing the chisel point, viz., by thinning the drill at its centre, or by pointing. By the former method the resistance to longitudinal splitting becomes lowered and by the latter method the cutting edges lose their support at and near the centre of the drill.

By the foregoing it will be seen that the feed possibilities of the ordinary types of drills are not very great. Either the drill will split or its cutting edges will break under heavy feeds,

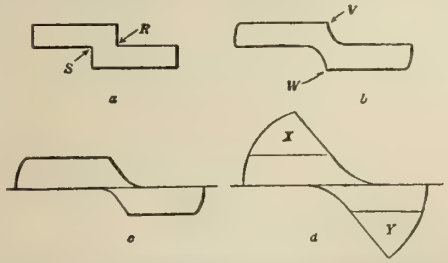

FIG. 4.—PROGRESSIVE DEVELOPMENT OF VAUCLAIN DRILL.

long before its torsional capacity is reached. Summed up, the disadvantages of this type of drill are as follows: (a) its weakness; (b) the unfavorable cutting lip angles of the chisel point create a tendency to longitudinal splitting of the drills; (c) if the chisel point is reduced by central thinning of the drill, the resistance to longitudinal splitting is lowered; (d) if the chisel point is reduced by pointing, the cutting edges are deprived of their essential support at and near the center of the drill; (e) essential central thickness and cutting edge support are obtained only in connection with a considerable chisel point; (f) the tendency to longitudinal splitting is increased by any increase in the extent of the chisel point; (g) the resistance to penetration due to the chisel point is very great and is increased by any increase in the extent of the chisel point; (h) it is not adapted to heavy feeds, and must therefore be used under the conditions of moderate feeds and high speeds, the least economical method of chip producion; (i) there are four cutting edges, two of which do not pass through the axis of motion, hence the aggregate length of the cutting edges is excessive. This is productive of greater torque, hence of power consumption.

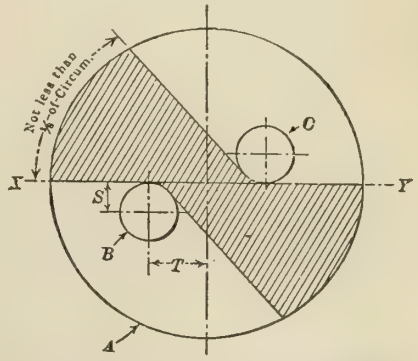

FIG. 5.—EXACT FORM OF CONSTRUCTION OF VAUCLAIN DRILL.

In order to beter describe the Vauclain drill, the section scheme will first be explained diagrammatically and the development of the actual section will then be illustrated.

In the upper part of Figure 3 is shown a bar comprising two flat bars overlapping and integrally connected, as indicated.

By beveling, as shown at O and P, below in Figure 3, the edges A and B meet at the axis of the bar. Since these beveled surfaces are at an angle with the axis the integral connection between the two flat bars remain unbroken.

Figure 4-a again shows the section or end view of the bar in its original form. Introducing fillets at R and S gives the form shown in Figure 4-b and removing the corners W and V modifiies it as in Figure 4-c. In Figure 4-d, by adding areas X and Y to the section, its torsional value is increased.

Figure 5 shows the exact section profile of these drills.

By examination of these diagrams it will be seen that the chisel point is

eliminated without central thinning of the drill and without weakening the cutting edges.

The improved design of this drill has brought about the following important features: (a) essential central thickness is secured; (b) cutting edges are properly supported at all points; (c) chisel point, with its unfavorable lip angles, is eliminated without weakening drill or cutting edges; (d) cutting edges pass through axis of motion; (e) there are only two cutting edges; (f) aggregate length of cutting edges is reduced to minimum.

As a result of these features the following advantages are secured: (g) increased strength and reduced liability to splitting; (h) it is adapted to heavy feeds, the most economical method of cutting metal; (i) productive capacity is increased; (j) horsepower consumption per unit of metal removed is reduced; (k) life of drill is increased and frequency of grinding is less; (l) distress in machine is less and resistance to penetration is reduced; (m) the afterwork of reaming is less.

THE CHADWICK BRASS CO, LTD., HAMILTON ONT.

THIS company was incorporated last month for the purpose of taking over the large brass manufacturing business of Chadwick Bros., Hamilton. Additional capital to the extent of $250,000 has been added and land has been purchased with a view to largely increasing the size of the plant. Four hundred men will be employed, and it is intended to double the present output of the works. The policy of the business will be entirely changed and will be controlled by Henry J. Turner, vice-president and general manager, formerly secretary and sales manager of the U. S. Hame Company, of Buffalo.

The president of the new concern is F. W. Baillie, of Baillie, Wood and Croft, the well known Toronto financiers. The directors include W. M. Currie, of the Canada Steel Co., Arthur and Fred Cradwick, of Hamilton, and A. Pardoe, of Toronto.

Mr. Turner, who will be the active head of the new concern, although he has been away from Canada for twenty-eight years, is a Canadian and a native of London, Ont. He was one of Buffalo's most prominent business men, ex-president of the Black Rock Manufacturers' Association and former chairman of the transportation committee of the Buffalo Chamber of Commerce.

The directors confidently expect that the business will develop into one of the largest of its kind in Canada. The company has been entirely reorganized and important plans are under way to extend the scope of the firm's operations under the most modern business methods.

Catalogues are now being prepared which will give the company's customers full information as to the various styles of goods manufactured.

IMMIGRATION FIGURES.

DURING the 9 months, April 1 to December 31, 1912, 334,083 immigrants arrived in Canada, 113,798 being from the United States, the remainder coming in by ocean ports from Britain and all other countries. These figures show an increase of 14 per cent. as compared with the number of arrivals in the corresponding months of 1911, which were 185,151, and 107,365 from the United States, making a total for the nine months period, last year, of 292,516 persons.

During the month of December, this year, there were 13,025 arrivals, 7,262 of them having been at ocean ports, and 5,763 from the United States, as against 10,624 for December last year, 4,945 of whom were at ocean ports, and 5,679 from the United States.

Varying the comparison, we have for the same nine months: British, 127,875; United States, 113,798; all other countries, 92,410; total, 334,083. Corresponding months of the preceding fiscal year: British, 120,137; United States, 107,365; all other countries, 65,014; total, 292,516.

Comparing the calendar year 1912 with 1911, immigration figures are as follows: 1912—British, 145,850; American, 140,143; other countries, 109,802; total, 395,804. 1911—British, 144,076; American, 131,114; other countries, 75,184; total, 350,374.

SOME FUNDAMENTALS IN HANDLING MEN.

By G. C. Webster.

A MAN can serve well only when he knows to whom he is responsible and for what he is responsible—in sequence of their importance—in which case he can serve more than one, if all are in accord as to the sequence of importance.

A man can serve well only where he knows that he is receiving full credit for his work and his ideas.

A man can serve well only when the work he is doing fits into his nature, and the environment is such that his mind is free from all irrelevant thoughts.

A man can serve well only when he has peace of mind.

To serve well, one must first possess the desire to serve.—The Business Philosopher.

Gossip of the Trade

The Dennis Wire and Iron Works Co., Ltd., London, Ont., whose business has rapidly increased of late years, are planning considerable additions to their plant for 1913. On January 1st, the ratepayers carried a by-law by a large majority, for the purpose of guaranteeing the bonds of the company to the extent of $25,000. A further $10,000 to $15,000 cash capital, in addition to the firm's present paid-up capital, will be subscribed and paid in by the present directors and shareholders. This additional capital will be used for the purpose of extending the firm's premises and installing new equipment. It is also the intention to commence manufacture of one or two new lines, particulars of which will be announced later.

In connection with the improvements the present steel locker shop will be greatly enlarged and new facilities added. When these alterations and additions are completed, this locker plant will be one of the largest and most efficient on the continent.

Twist Drills for Australia.—According to an American commercial agent in Australia, while, with the introduction of high-speed steels, every British maker put a line of twist drills on the market, and these made great headway at first, shop managers have come to realize that they are too expensive. He states that, as a result, American twist drills are rapidly returning to favor. For example, the stores schedule of the South Australian Railway and Government Departments for 1911-13 shows that most of the twist drills contracted for in this period are to be either Cleveland or Morse, whereas in previous years the contracts have been made with British makers. It is well to remember that the import duty on drills is very high.

Mr. M. J. McCann, traveling salesman for the Renfrew Machinery Co., wins the grand prize of $100 which the company hung up for competition among its salesmen. Mr. McCann disposed of more cream separators than any other salesman.

TORONTO FIRM EXTENDS.

FIVE years ago, the premises of the Toronto Testing Laboratory, Ltd., were ideal for their laboratory work. In that time the business has grown to such an extent that more commodious premises became necessary. These have been found at 160 Bay Street, Toronto, where the firm will be able to maintain the high standard of their service, and to keep abreast with the wonderful development in the metallurgical field.

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

A SELF-PROPELLING SAND MIXER.

AT the Foundrymen's Convention held in Buffalo in September last a working exhibit that attracted wide attention was that of the self-propelling sand-cutting and mixing machine herewith illustrated. This machine is now being built for the Canadian market by the Sand Mixing Machine Co., of Canada, whose head office is located at Brantford, Ont.

Fig. 1 shows a front view and Fig. 2 a rear view of the machine, and from these a good idea of its construction may be obtained. The mixer operates on the foundry floor where the sand is shaken out of the flasks. It is driven by a 7½ H.P. electric motor mounted on the machine. Current is taken from any convenient source by means of a flexible cable wound on an automatic take-up reel. Steering is effected by hand through the wooden lever seen in Fig. 1. The machine has two speeds forward and two back. It is of thoroughly substantial construction and is not by any means an experiment, having been in successful use in the United States for the last five years.

The knives operate in the same manner as in an ordinary batch mixer, the blades being arranged in two opposing spirals so that the sand is very thoroughly mixed. Moreover, this arrangement of the blades draws the sand to the centre, leaving the heap triangular in section, just as when cut by hand. The knives revolve at 75-80 R.P.M., each blade taking ½-inch off the sand heap at each revolution. The shaft upon which they are mounted can be lowered to suit the height of the heap by means of the small vertical winch seen on the front of the machine—Fig. 1.

In operating, the machine is backed up against the foundry wall astride the sand heap and travels forward at a speed of 15-20 feet per minute. The knives, as they are lowered, cut their way to the floor, throwing the sand back towards the wall. The cutting knives are controlled by a multiple disk clutch, which will slip and prevent breakage should the blades strike a heavy casting or gate left in the sand.

One man operates the machine and does all the work of cutting for an entire foundry. The method usually employed is to run the machine over the floor at night after the castings have been removed to the cleaning department. The sand is thus cut and mixed all ready for the moulders the next morning. The mixer can be operated successfully in almost any foundry and, where 100 moulders are employed, will, it is claimed, pay for itself in one year.

Mr. N. D. Neill is general manager of the Canadian company, who are open to either lease these machines or sell them outright.

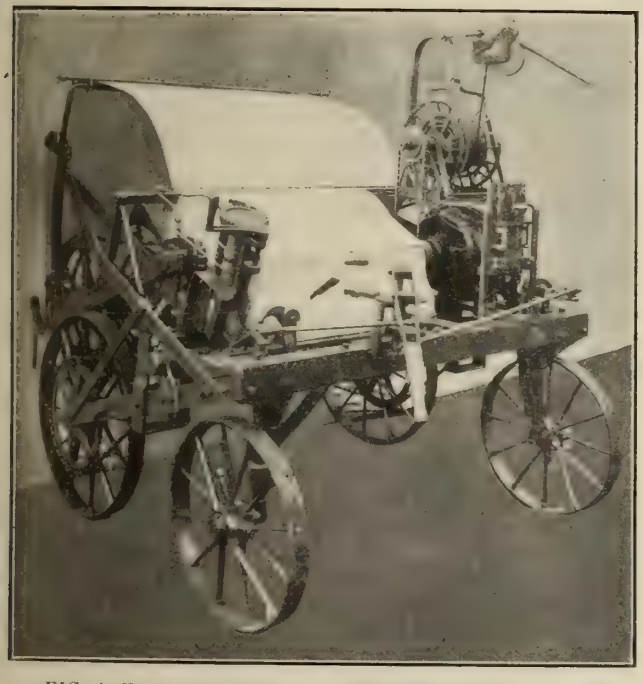

FIG. 1. FRONT VIEW OF SAND MIXING MACHINE.

FIG. 2. REAR VIEW OF SAND MIXING MACHINE.

PEASE FOUNDRY CELEBRATION.

NOVEMBER 12th was the 22nd anniversary of the opening of the Pease Foundry at New Toronto. The men in the shops wished to celebrate the event, and decided on Friday, January 10th, 1913, as a suitable day on which to show their appreciation of the mechanical superintendent, Mr. J. W. Phillips. On the above date the firm held an "at home," and this year over 250 people were present. This was held at the company's other plant, at the head of Shaw Street. Mr. D. W. McKinnon, president of the Pease Foundry Co., made the presentation of an illuminated address to Mr. Phillips, who thanked the men. He was followed by a friend, Mr. Agar, who said a few words in appreciation of the mechanical superintendent.

A prosperous city.—Eight new industries were located in Berlin, Ont., during 1912, and additions were made to fifteen manufacturing establishments.

Wanted a free site.—A New York manufacturing concern recently applied to the Maisonneuve city council for a free factory site. It was refused.

MOLDING A "FAIR-LEAD."

By J. H. Eastham.

MOLDERS accustomed to marine and dockyard work will be familiar with the type of casting technically termed a "fair-lead," shown in plan and end views by Fig. I. An order for a

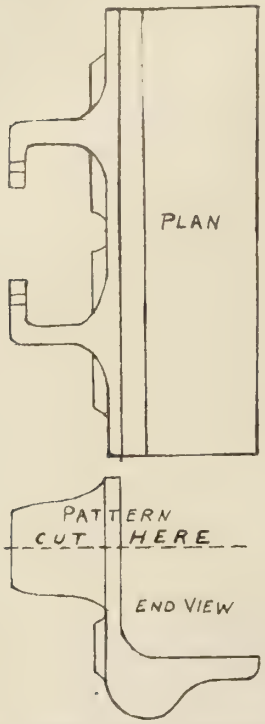

FIG. 1.—MOULDING A FAIR-LEAD.

number of these castings, from a customer's pattern, was recently placed in a jobbing shop at a price necessitating rapid output and small outlay on rigging. The method adopted for molding the piece was as follows:

The lower or larger piece of the pattern was bedded in the floor. The joint

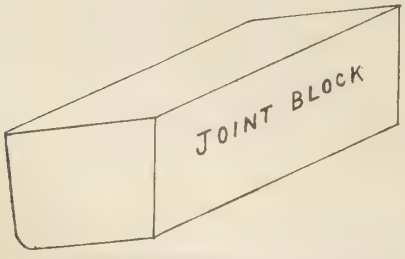

FIG. 2. MOULDING A FAIR-LEAD.

block, Fig. 2, roughly built by a carpenter, was lowered into the pattern, and the whole rammed round, up to the floor, or joint level. The block was now removed, and the sloping joints left by its two ends and the side opposite the pattern were lined up with wet parting sand. One inch of facing sand was next spread over the bottom surface of the sunken joint and pattern and a lifting grid, or drawback, lowered to place—as shown in Fig. 3. A row of short gaggers was considered advisable along the front of the lift, the core being then rammed up to the level in the usual way. An ordinary pipe cope part, with slight alterations to the bars, easily covered the top half of the pattern. This was next rammed up and hoisted away, two wood screws carrying the top half of the pattern at the same time. The drawback was then removed by means of a short wedge down a plate laid across that portion of the drawback and lower section of the mold not covered by the narrow cope. Undue strain whilst pouring was thus avoided.

As in castings of this and similar types great strength is of more importance than an elaborate finish, exceptional care was taken in the mixing of the iron charged for this contract. The results

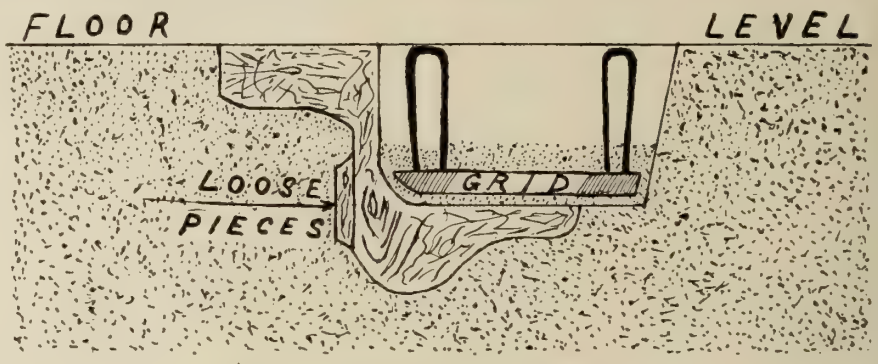

FIG. 3.—MOULDING A FAIR-LEAD.

three-legged chain and turnbuckles, the liberal amount of taper left by the joint block making this operation possible with very little "ragging" or breaking of the lift. This was eminently desirable as the drawback was finished and blackened whilst suspended from the crane, and remained in that position until finally lowered into the mold, after the withdrawal of the pattern, the finishing of the drag, and placing of three bolt hole cores in their respective places.

The cope being finished, tried on and satisfactorily closed, two rails were packed up across it, and a weight lowered upon them. The overhang of the rails as will be seen in the end view of the closed mold at Fig. 4, was utilized to were higly satisfactory, test bars 24-in. x 2-in. x 1-in. showing a breaking point as high as 3,140 lbs., with 5/8 in. deflection.

PRIZES FOR ARTICLES ON THE UTILIZATION OF WASTE.

IN a recent issue of the N. E. L. A. Bulletin, Mr. H. F. Frasse, purchasing agent, the Brooklyn Edison Co., writes as follows regarding his offer of prizes for articles on the utilization of waste:—

I am glad to note the acceptance by the Executive Committee of my offer of three prizes of $25, $15 and $5 for the best articles by members of the Associ-

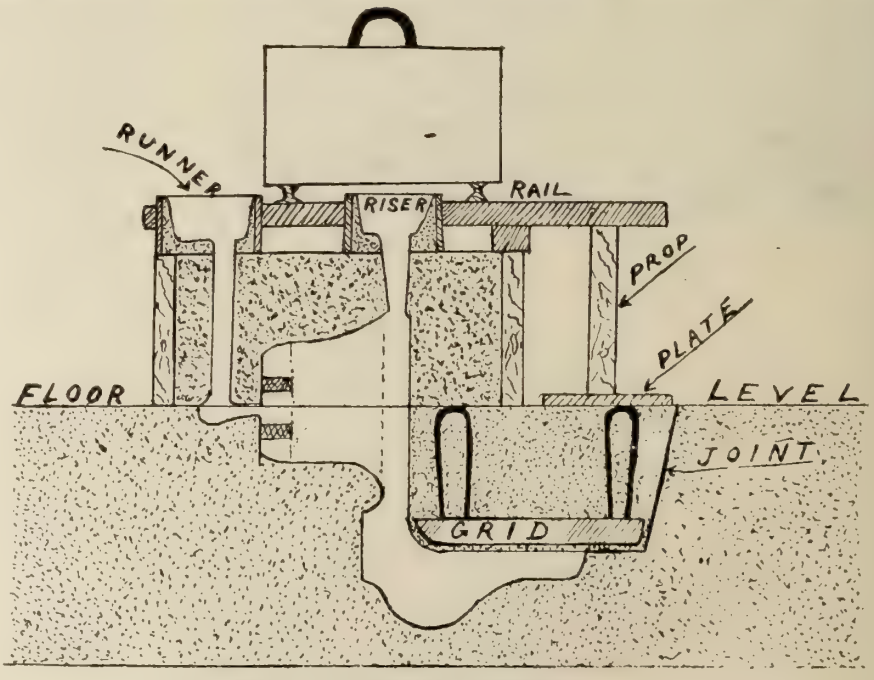

FIG. 4.—MOULDING A FAIR-LEAD.

ation, explaining and illustrating the economies that can be effected from the utilization of "waste" material by the employes of electric light companies. I welcome the opportunity offered me to set forth briefly in the pages of the Bulletin, my ideas on the subject, as well as just a few of the lines along which higher efficiency in the use of material can be secured. The offer of three modest prizes was intended to induce a spirit of emulation and economy on the part of employes, regardless of their posts of duty. The subject is so broad that only a few suggestions are needed to show how economy and utilization may be practised—primarily for the good of the company in which the employe works and obviously for his own benefit because of assured advancement. When it is considered that more than one hundred millions of dollars were obtained in the year 1911 by the simple process of changing into bank funds that commodity flippantly known as "junk," it is evidently necessary for everyone to look to the economical operation of his own work.

The employment of cotton waste is necessary, and it can be used over and over again by a simple method of extracting the oil, either by centrifugal action or by a cheap press, the use of which oil would go towards reducing the lubrication account.

The soot from the stacks that accumulates and is shoveled into barrels and carted to the dump pile is really a high grade of lamp black , even if it is not as deep in color as that for which there is a market at six cents or more per pound. Still the soot can be used in combination with concrete to give a proper or darker tone in laying sidewalks or floors, not taking into consideration its use as a binder in briquetting coal waste.

Used machinists' files, instead of being thrown away or sold as old metal, may be restored by a simple acid bath or recut by the same sand blast which many companies employ for removing old paint from iron structures.

Many janitors, otherwise watchful, fail to recognize the profit in saving accumulations from the waste-paper baskets, old trade publications and catalogues—all of which can be baled and sold to paper mills with but a few inexpensive appliances. Naturally some system must be used to keep the catalogue covers which have been torn from the books separate from the paper, and the letter paper separate from the magazines and trade journals, keeping each class of paper to itself. One or more small forms on which to hang the burlap bags could be made from pieces of 2 by 3 spruce and stood in the corner of the cellar, and when the bags become full they might be laid aside for sale. This is preferable to allowing ragpickers or paper dealers to come into the factories and mills to cart away the material for the labor of removing it.

Old towels, wiping cloths and similar fabrics might be sold, instead of finding a last resting place in the furnace or underneath the hot water boiler.

Improvements might be made in galvanizing bolts and turnbuckles, which would permit of having the zinc coating inside the nut and on the thread so that nut and bolt would fit snugly.

The oil used in transformers might be bottled after pouring through some straining fabric, and would find ready sale to hardware, dry goods or sewing-machine stores as an inexpensive lubricant.

Scrap Metal.

Often in my negotiations with founders for the disposition of my metal accumulations, which I have no difficulty in selling direct to the users, I am told that my price is too high and that the same class of goods can be obtained from scrap dealers at a lower figure. It is fair to assume that my correspondents are telling the truth and not making the statements with the intention of getting a lower price; therefore, it is obvious that the factories, mills or shops which sell to the scrap dealers are most assuredly not receiving full value in price obtained, perhaps due to carelessness in weighing of the material. This is pertinent because it shows that the accumulations in many shops are considered as junk, that the material is in the way, and must be got rid of, whereas by the process of separating the iron, brass, copper, zinc or such metals as are to be disposed of, one may reach the ultimate buyer, the foundryman, who is willing to pay the difference above what the scrap dealer pays.

As a good deal of economy can be practised in the burning off of lead cable, weatherproof wire, etc., and in the sale direct to metal foundries, it is well to consider even the ashes in which there is more or less copper and lead and for which a good price can be had by selling to refining companies.

A great many other ideas could be set forth, but these will suffice to show how illimitable is the field of economy.

SUGAR REFINERY FOR ST. JOHN, N. B.

CONSTRUCTION work will start early in the spring on a $3,000,000 sugar refinery at St. John, N.B., to be in operation inside of two years. It is being engineered by the Atlantic Sugar Refineries, Ltd., who have deposited a draft for $100,000 with the St. John city chamberlain as guarantee that the refinery will be erected.

There will be nine buildings, the refinery proper being a ten-storey structure, 350 feet long by 170 feet wide. The construction will be mainly of concrete and may be faced with brick. To build and equip the refinery will cost in the neighborhood of $5,000,000.

The proposed refinery will be the largest in Canada, and will employ about 700 men. The sugar will be imported in its raw state from the West Indies, and the open harbor here during the winter will allow the raw material to be brought in by water direct. Mr. Holgate, the refinery engineer, has been in St. John several days recently, completing the work in connection with the location of the foundations. These will have to go down to bed rock, and considerable excavating will be necessary. The agreement with the city of St. John calls for the forfeit of the $100,000 guarantee if the construction work is not started in the spring, and the terms of the agreement also set a limit on the time when the refinery must be in operation. The capacity of the works will be over 2,500 barrels.

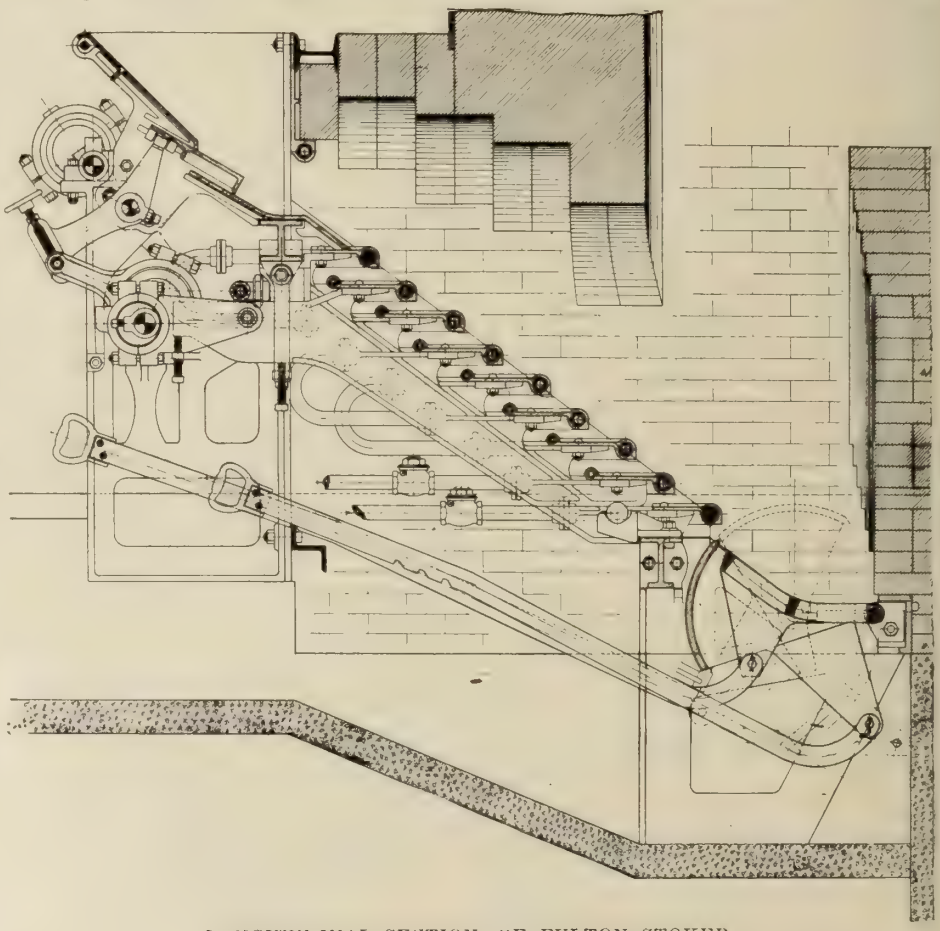
Mr. J. F. Stillman, who has had a wide experience in designing and operating sugar refineries in the United States, has been given complete charge of the planning of the new refinery for the Atlantic Sugar Refineries, Ltd. The incorporators are: Alexander Chase-Casgrain, Errol Creelman McDougall, John Jennings Creelman, and Pierre Francis Casgrain advocates; and Florence Ellen Seymour, stenographer, all of Montreal. Messrs N. B. Stark & Co., of Montreal managed the underwriting and placed the securities.

HEAT INDICATOR FOR BEARINGS.

A NEW heat indicator introduced by General Electric Co., consists of a paint for application to bearings or other parts of machinery and electrical apparatus. It is normally of a bright vermilion, but on reaching a temperature of 120 degs. Fah. shows a change of color, and at 190 deg. to 210 deg. F. is almost black. When the temperature of the part falls below 120 deg. F., the paint resumes its normal red color. It is claimed that the paint is practically indestructible, that it is unaffected by lubricating oils, that it prevents the formation of rust, and that the warning which it gives enables a machine to be stopped before any damage is done by overheating.

There are only two classes in society: those who get more than they earn, and those who earn more than they get.

Features of the "Fulton" Water Cooled Mechanical Stoker



By C.T.R.

At the present time, advance is the watchword in almost every line of human effort, and in no branch of industrial activity is this more true than in that referring particularly to the generation of steam through its foundation and accessory mechanisms. The Fulton stoker here described introduces to our readers a type of mechanical firing apparatus, with whose detail, we believe, more or less unfamiliarity exists, its introduction being, as we understand, new to Canadian steam power generation enterprise.

A NEW stoker has been placed on the Canadian market by the Hare Engineering Co., Ltd., 14 King Street East, Toronto, which is designed on decidedly original lines. While this mechanism, which is known as the Fulton Water-cooled Mechanical Stoker, is new to Canada, it has had a long and successful experience in the United States, and is in use in some of the most prominent plants in that country. It has taken a good many years for the merits of mechanical stoking to be generally recognized by plant owners, even when it is so easy to ascertain the facts in relation to any subject, by consulting engineers, architects and others who have the design of power plants under their care. This is not because stokers have not been able to demonstrate their great superiority over hand firing methods so popular with the uninitiated, but because of the many defects in design which characterized the earlier machines and which resulted in an altogether too high rate of depreciation and repairs, thus lessening to a large extent the saving at first effected. There is absolutely no reason whatever why a mechanical stoker should have a higher rate of depreciation than other machines, such as pumps, condensers, economizers, etc., found in power plants. Although it is often stated that heavy repairs are to be expected with such machines, this view cannot be accepted today in the light of modern improvements.

The Fulton Water-cooled Mechanical Stoker, which has been developed within the last five years, is of the natural draft type. If an engineer had been asked a few years ago if it were possible to carry 100 per cent. overload with a draft pressure of .18 inches water gauge, he would naturally have said that it was not, and that in order to carry such overloads, forced draft must be employed. He would have been quite right then, although decidedly wrong to-day. The development of the Fulton Water-cooled Stoker has not only made it easily possible to carry such heavy overloads with medium and light draft pressures, thereby securing all the flexibility of a forced draft stoker without the expense of operating the auxiliaries, but by a most radical departure from all other previous designs a system of water-cooling of the parts has been developed which has solved completely the problem of stoker repairs, and has reduced the rate of depreciation to a point hitherto considered impossible. Records of this stoker covering some four years of continuous operation show most remarkable results with regard to economy, capacity and low repairs.

In a large plant in Cleveland one of these stokers, installed under a 466 h.p. Stirling water-tube boiler, was operated twenty-four hours per day, seven days per week, for over two months, carrying continuously an overload of 100 per cent., or generating 935 horsepower when burning low-grade slack coal, averaging 12,000 B.t.u. per pound with 3.7 per cent. sulphur. The draft at the grate during this severe trial did not average more than .2 inches water gauge. The Fulton stoker showed an evaporation efficiency in the neighborhood of 70 per cent., notwithstanding the overloads carried.

LONGITUDINAL SECTION OF FULTON STOKER.

Stoker Detail.

The Hopper, as will be seen, extends entirely across the front of the stoker, thus proving a large coal capacity. The back is continuous and provides a stiffner for the hopper independent of the boiler front. The lower side of this back plate is water-cooled, which feature is a distinct advantage in not only absolutely preventing the plate from burning out, even after many years continuous use, but, and of no less importance, it keeps the fire from creeping up into the hopper while banked and eliminating trouble from the coal in the hopper fusing into coke masses and interfering with the free action of the coal feeding mechanism. On starting up the stoker when there is no steam in the

boiler to operate the driving engine, the feed slides are always easily operated by hand. These points will be appreciated by engineers generally.

The Coal Feeding Mechanism.

In the bottom of the coal hopper are the coal feeding pushers. These slides

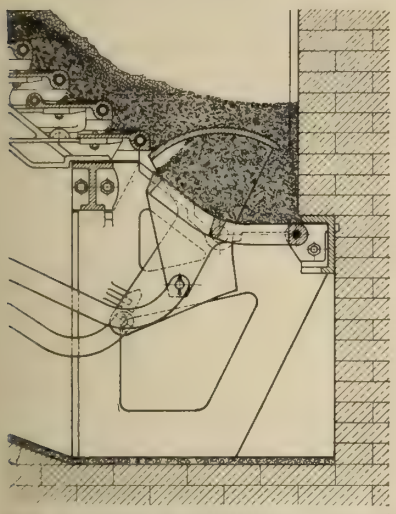


FIG. 1. FIRST MOVEMENT, DUMPING SHIELD PULLED UP.

are so designed that by a simple reciprocating motion the coal is fed from the hopper and pushed over the dead plate to the top grate bar to begin its movement down the grate incline. The actuating mechanism of these slides is extremely simple in detail, and readily adjustable both as to the extent of the movement backward and forward, and also as to the number of movements per minute. All adjustments can be made while the stoker is in operation, yet, once the stoker has been adjusted to suit the extent of the normal load and the

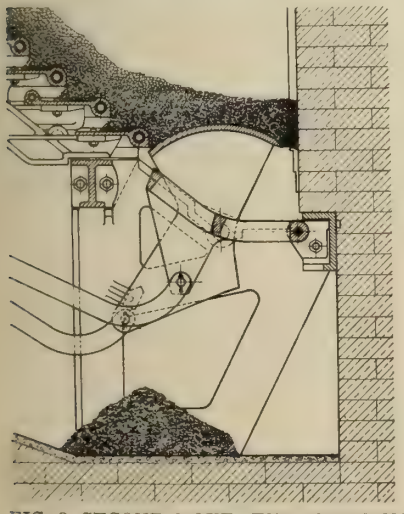

FIG. 2. SECOND MOVEMENT, DUMPING GRATE DROPPED.

character of the fuel to be burned, little attention, it is claimed, becomes necessary.

A feature of the feeding mechanism that is of considerable importance is the employment of a short pusher at each side of the stoker, capable of independent adjustment from that in the centre. By the adoption of this arrangement it is easily possible to feed the coal at the sides, next the brick side walls somewhat heavier than in the centre, and thus prevent the formation of holes in the fire along the sides, owing to the more active combustion that takes place there due to the radiation from the side walls, and the lower position of the ignition arch.

The Grate System.

The grate surface of this stoker is on an incline of about 35 degs. with the horizontal and is formed of a number of broad flat horizontal plates arranged in an overlapping series of steps, one above the other, from the dead plate which receives the coal from the hopper, to the dump grate at the bottom. These flat grates are all identical in design, but are arranged in two separate banks, moving and fixed, and alternating the one with the other over the entire grate surface. The fixed grates are bolted to the side risers or side frames of the stoker while the moving grates are bolted to moving risers which at their upper ends are connected to the eccentrics on the stoker shaft. Their lower ends are carried on rollers on the frame. This method makes it possible to secure a movement of the bank of moving grates, which, at its upper end is elliptical and at its lower end, approximately a straight line. The number of revolutions of these eccentrics is entirely under the instant control of the fireman, hence while the extent of the horizontal movement is fixed, the rate of feed of the coal along the grates is controlled by varying the speed of the eccentric shaft. While the vertical movement of the eccentric is itself fixed, the similar movement of the grates is modified to suit the different grades of fuel to be burned, and by a very ingenious device, this vertical movement can be varied from nothing to the full movement of the eccentrics. Thus, for a grade of coal of high coking values, the grates may be adjusted to move in an ellipitical or a straight line movement forward, and an elliptical movement backward, carrying the moving grates at all times clear of any loose coal or coke which may lie on the rear of the fixed grate below. The action of the grates as described is such as to compel the coal to move forward by a controlled and definite movement, and to any degree of lifting action deemed necessary thus controlling completely not only the action of the burning fuel in the fire but the ash as well from the hopper to the dump grate.

Another advantageous effect gained by this grate movement is the lifting and breaking up of any coke masses that may form in the fire, thus securing the freest possible passage of air through the fire and facilitating rapid combustion. As the coke and accumulating ash are forced towards the dump grate, the lifting action of the grates becomes less and less until it disappears entirely,

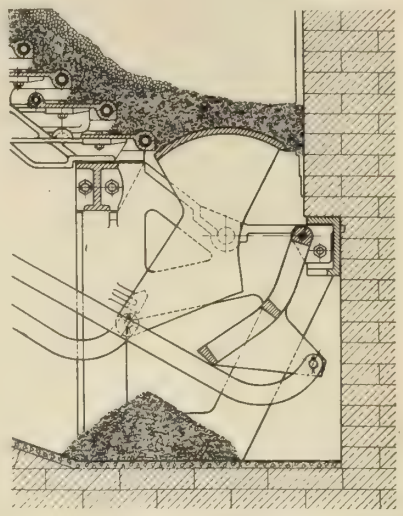

FIG. 3. THIRD MOVEMENT, DUMPING GRATE RAISED.

thereby preventing the formation of air holes in the fire.

By reason of the considerable overlap that exists between each grate and its neighbor, the sifting of fine unburned coal through to the ash pit is absolutely prevented, while the action of the moving grates is such as will push back into the fire any lumps of coal or coke that may work in between the grates. It should be noticed also that this grate movement is secured without alteration in the total extent of air space between the grates.

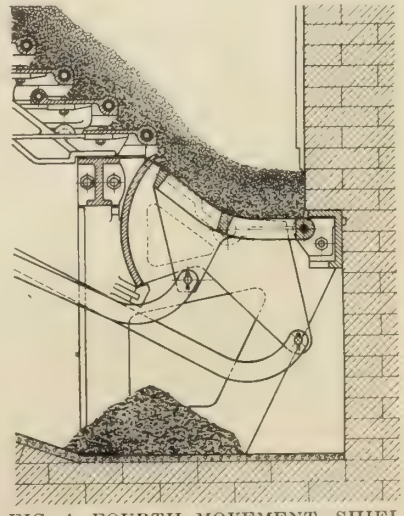

FIG. 4. FOURTH MOVEMENT, SHIELD DROPPED, FIRE CLEANED.

Positive vs. Gravity Feeding.

A consideration of the details of the feeding mechanism of this stoker will show the advantage of the positive feed as compared with the gravity feed. In stokers employing the gravity system of

feeding, the angle of inclination of the grates to the horizontal must be considerable, and in order that the coal be made to move down the incline freely, this angle must be made greater than the angle of rest of slack coal.

The Water-Cooling System.

The one feature by which, this stoker differs materially from others is the water cooling of the grate bar. Each grate bar is water-cooled along the side in contact with the fire, by casting into it a 1¼ inch extra strong cold drawn seamless steel tube. This tube is first properly shaped and placed in the mold and the grate bar cast around it. The tubing used in these grates is specially made for this purpose, and is tested to 1,000 lbs. per square inch air pressure under water. The connections between one grate and the next are made through return bends of the same tubing and all connections are made with special bronze to bronze 4-bolt flanged Dart unions, making leaks practically impossible.

Treating the fixed grates as one unit and the moving grates as another, water connection is made direct from the boiler to the lowest grate in each bank and from thence upward from grate to grate until the top is reached, where another connection is made to the boiler above the water line. No flexible joints or hose connections are used in the entire design, and therefore no leaks are possible. The flexibility necessary to permit the action of the moving grates is secured by a free length of the same seamless tubing at the inlet and outlet of the grates, so that the small movement necessary in the grates is provided by the flexibility of the tubing itself.

The circulation of the water through the grates does not depend on the unbalanced condition caused by an increased temperature at one part of the cycle as is the method adopted in almost all steam boilers, for, if this were the case, the tubing in the grates would soon clog up with scale, preventing the flow of the water and rendering the water cooling system useless. This difficulty has been got over by the invention of the flash system which is claimed to be unique with this stoker. Inserted in the individual inlet pipes to the fixed and moving grates are two 1¼ inch bronze swing check valves, arranged to open and allow water to pass to the stoker, but to close against any flow in the opposite direction. On the application of heat to the grate bars, the water in the tubes is partly evaporated into steam. The mixture of water and steam thus formed being prevented from discharging downward owing to the action of the check valves, is driven upward through the stoker piping, and into the boiler. As soon as this discharge takes place, the check valves open and permit more water to enter the stoker pipes from the boiler, when the same violent action is repeated. In normal service, this flashing takes place every 10 or 12 seconds, and is accompanied by sufficient velocity to scour and polish the inside surface of the tubes and thus most effectively prevent scale accumulation. Grate bars cut in two after being in continuous use for four years show an absence of scale.

The Dump Grates.

As will be seen by the accompanying cuts, the ash cleaning device of the Fulton Stoker is extremely simple. It is claimed by this arrangement to separate the ash and clinker from the burning fuel without the usual loss of unburned coke or live coal, while at the same time, preventing the entrance of cold air during the operation of cleaning. The dumping arrangement is not automatic in the sense usually employed, that is to say, it does not grind out clinker ashes or coke as the case may be at all times whether the fire requires cleaning or not, but is so designed that perfect cleaning can be secured when the condition of the fire warrants it, and under conditions that promote the highest possible economy.

It will be noticed that the dump gear consists of two parts, the shield and the dump grate. In the operation of cleaning, the shield is thrown up as in Fig. 1. This cuts into the fire at the point where the ash and clinker accumulate, thus not only preventing the burning fuel from being discharged into the ash pit but by extending across the dump grate to the face of the bridge wall, effectually sealing the ash dump from the entry of cold air while cleaning. The dump grate is next dropped, Fig. 2, carrying with it the ashes and clinker held under the dump shield. It is then returned to normal position, as in Fig. 3. By lowering the shield again, as in Fig. 4, the burning fuel is allowed to flow over the dump grate. In this way, perfect cleaning is secured by a very simple and effective arrangement.

In the many tests that have been made of this stoker the percentage of good coke present in the ash is extremely low and compares very closely to the chemical analysis.

Repairs.

The economy of the Fulton Stoker is shown, perhaps, to better advantage from a consideration of repairs point of view than from any other aspect.

In a plant at Reading, Pa., 1,000 H.P. of these stokers have been in continual service 16 hours per day for four years, and carrying a large overload. The total repair cost during this time was at the rate of 2.4 cents per horse power per year.

BAD TOOLS MAKE GOOD WORKMEN.

AT a time when practically all the great centres of engineering instruction are naturally proud of their admirable equipment, it may seem hypercritical, or even ridiculous, to question whether much of the expenditure on machines and machine tools does not really react to the detriment of the pupil. However, these things do not stand still. Where there has been expenditure in the past, there will be further expenditur in the future, and I merely ask that some consideration should be given to the views of one who has experience in teaching the elements of engineering subjects, since these views tend to encourage economy in one direction, which would presumably leave more money free for expenditure on other branches, in which it may be that such expenditure would bear better fruit.

The Best Engineer an Opportunist.

The firm belief on which I base my contention is that the best engineers are great opportunists; men who make the most of the appliances at their command, and are not discouraged when they are called upon to carry out a job which appears to be beyond the commonly accepted capabilities of the implements at their disposal. When a tail-shaft breaks in mid-ocean, it is not to be expected that the engineers on board the vessel will have the help of all the ideal appliances for carrying out a repair, but the man who does the thing somehow saves the cost of salvage. When emergencies arise—and an active engineer's life is more or less full of emergencies—they have to be dealt with as best they can at the moment, and under such conditions I would sooner rely upon a man who can keep going an engine which properly belongs to the scrap heap than upon one who fully understands the possibilities of the most complex and marvellous automatic machine tools, and despises whatever is not recognized as representative of modern practice.

Only recently, the principal of a great college of science told me that he had been discussing with a former pupil, who has now made his mark in the engineering world, the value of his scientific training, and had asked what part of his college course had been of most value to him. The reply was that he had learnt most from a casual incident. A member of the staff of the college had occasion

OTIS-FENSOM ELEVATOR COMPANY
LIMITED

MANUFACTURERS OF
OTIS STANDARD ELEVATORS

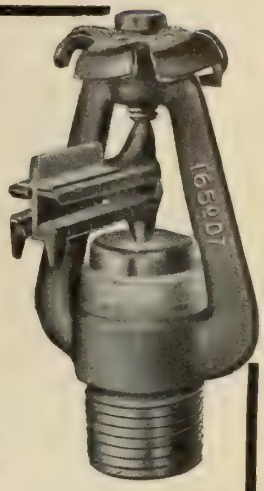
TRADER'S BANK BUILDING TORONTO.

Toronto, June 23rd, 1908.

ALL AGREEMENTS SUBJECT TO STRIKES ACCIDENTS OR OTHER CAUSES BEYOND OUR CONTROL

The General Fire Equipment Co.,
72 Queen St. E.,
Toronto, Ont.

Gentlemen,



We wish to congratulate you upon the satisfactory manner in which you installed your "Non-Corrosive" Sprinkler Equipment in our factory at Hamilton.

The equipment itself has met the requirements of the Fire Underwriters in every respect and has been thoroughly satisfactory to them. But, we wish to say that the manner in which you carried on the work in our factory without hindrance to our business was very pleasing indeed, and also the fact that you, in spite of the difficulties which you met, completed your contract in the time specified.

Yours very truly,
OTIS-FENSOM ELEVATOR CO. LIMITED
By Geo H Fensom
General Manager

CHF/OH

Since this Letter was written—Four and a Half Years ago—

Manufacturers' Automatic Sprinklers

have paid for their installation by the reduction in Insurance Premiums which they effected.

And in the future, as in the past four years and a half, the Otis-Fensom factory will have absolute protection from fire.

Can you afford to leave your factory unprotected when the most efficient protection in the world will pay for itself?

Write us for full information. Estimates on equipping new and old buildings **free.**

The General Fire Equipment Co., Limited

72 Queen St. E. TORONTO, CAN.

STEEL CASTINGS

Acid Open Hearth Steel for **Locomotive** and **Machinery Castings.**

Stock Process Steel for **Automobile** and **Light Castings of all descriptions.**

Prompt Deliveries.

Let us figure on your requirements.

The Dominion Steel Castings Company, Limited
HAMILTON, ONTARIO

to move a power launch between two points overland, and the ingenious means employed to overcome various difficulties of transit as they arose had provided the pupil with ideas which he had successfully translated into action time after time in his subsequent career.

At another place I remember a batch of engineering students being freed from lectures for a couple of days for a somewhat similar purpose. A ten-ton cutter had come ashore, and the owner wished to beach her for repairs on the spot. The shore was very steep, and the coastguards and the local boat builders assured him that the job could not be done. However, it was done, and done satsifactorily, and I think all those who had a hand in it gathered more useful experience than would have come from a month of ordinary workshop practice.

The Test of Real Ability.

For elementary students I am certain that my theory holds good in the main. Almost any boy can work steadily through the construction of a model engine or a small dynamo with thoroughly adequate tools and the guidance of a skilled instructor; but if the tools are imperfect or insufficient in variety, the teaching of the instructor, who is constantly helping him to devise makeshifts, and showing how difficulties can be overcome by ingenuity rather than by improved machinery, becomes far more helpful and inspiring. The doing of the obvious, or the fulfilment of straightforward work that never presents unexpected difficulties, does not make a real engineer. As a matter of fact, I doubt whether the true engineer is not invariably born as such, but mechanical resource, if it exists at all, can, I believe, be "trained on" by facing and overcoming difficulties, and smothered by having all these difficulties wiped out before the pupil realises their existence. Start trained men on straightforward jobs on good machines and all the results will be practically identical; put them on to imperfect machines and give them imperfect tools and you will soon see which are the true engineers. Some will find out what the machines cannot do while some others are making them do it. This quality of achieving the impossible can never be brought out in a shop so perfectly equipped that all things are possible.

Reliable Mechanics vs. the First-Class Engineer.

There is a big difference, over and above that of mathematical and scientific training, between a reliable mechanic and a good engineer. The one is satisfactory enough provided that he carries out well the work entrusted to him on machines suitable for the work. The other must be always looking ahead and progressing. A combination of high scientific attainments with sound machine shop experience does not necessarily produce a good engineer. What is wanted is a species of instinct; something that tells a man, without conscious reasoning, what ought to be done to improve matters, what is the cause of some trouble, or what will be the result of an experiment not yet tried. Probably every intelligent man has some trace of this instinct, but a first-class engineer has it highly developed. The question is whether this acuteness in mechanical matters is purely a natural attribute, or is capable of being "trained on" to any appreciable extent. If the latter, as I believe, then the young engineer's work should contain unexpected difficulties if it is to be of the greatest possible benefit. Clearly, when he leaves college and goes into works—or if he is on the "sandwich" system during that part of the year when he is employed in works—he cannot have unnecessary pitfalls put in his way without depreciating the value of a commercial product. If this sort of thing is to be done at all it must be done in the college course. If inferior or faulty tools are to be used deliberately it must be upon work on the perfection of which no made reputations depend.

College Equipment Suggestions.

What I should like to see is something in the nature of a pause in the improvement of some parts of the equipment of technical colleges. The tools and machines which go out of date or become faulty and inaccurate under the handling of many beginners, instead of being sold off at scrap prices, might be gathered in a shop specially set apart for them, and in that shop all engineering students should spend some part of their time. The work which they did there, together with particulars of their difficulties and the assistance given to them, would be kept quite separate from their work done in the properly equipped machine shop, and I think ought to be taken into full account in estimating progress and in examination results. It would be helpful, too, in enabling teachers to advise their students as to the branches of the profession best suited to their abilities. It would be found that some men would do astonishingly fine work under bad conditions and yet would not shine elsewhere. Again, students of an almost ideal character, quick and accurate in theoretical work, reliable in practical work, would be found not to possess the curious faculty of getting good from bad, and would be saved from wasting themselves on branches of engineering in which the exercise of this faculty plays a particularly important part.

I should like, also, to see some old—preferably badly designed and badly handled—engines and electrical equipment kept and used in somewhat the same way. Much may be taught from these "awful examples." I well remember one which did excellent service to many generations of engineering students. It was a single-cylinder horizontal steam engine, supplied through about 50 feet of unlagged steam pipe by an antique Scotch boiler working at a painfully low pressure. The steam pipe descended about 12 feet vertically into the steam chest, and the exhaust pipe rose vertically through the roof into the open air. The "swashing" of water could be distinctly heard whenever the engine was at work, and I imagine that a cover would have gone very quickly if the piston and D valve had fitted properly. The comparison of diagrams taken from that engine with those from a modern set in the same shop was very instructive, and it and its boiler were continually useful in showing how things should not be made or fitted up.

Perhaps I am carrying a somewhat revolutionary suggestion rather too far, for I admit that the "handy man" is not the only variety of engineer, and it is the "handy man" who would probably do best in such surroundings. Even so, a very big percentage of engineers still find their greatest asset in resource. If a man has been given a thousand a year at the university, he cannot be expected to settle down very contentedly on the $12 a week that he subsequently earns, and if an engineering student has been accustomed to having at hand the ideal implement for every job he does, he will be equally helpless if he has to face rough and ready work under difficulties. Moreover, it is only by comparison that we learn to appreciate what is good when we get it, and at the same time to realise that even good may be made better by the application of sufficient knowledge or ingenuity.—From a contribution by "Hastatus" in the "Arena" monthly.

The Pollard Mfg. Co., Niagara Falls, Ont., in addition to their original line of stone and marble working machinery, are now manufacturing small hand-power and electrically driven traveling cranes, electric hoists and heavy steel derricks. Job casting work is also being undertaken, their foundry capacity being such as to secure large, heavy and reliable castings on short notice. Messrs. E. T. Pollard and William La Bombard, president and secretary-treasurer, respectively, were, for 10 years, associated with the F. R. Patch Mfg. Co., Rutland, Vt., makers of similar machinery.

BOILERS

"Inglis" is the "Buy" word for Boilers.

"Inglis" spells satisfaction.

Fifty-two (52) years' experience in Boiler making, combined with the most modern kind of a shop means **service.** "Inglis" Boilers never fail to give satisfaction.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

FOUNDRY AND MACHINE SHOP.

Calgary, Alta.—Operations at the Ogden C.P.R. shops will commence with 400 men on February 1.

Guelph, Ont.—Fire in the japanning room of the Gilson Engine Works did $500 damage on January 14.

Saskatoon, Sask.—On Sunday, January 12, fire gutted the Western Foundry and Machine Co. works here. Damage, $25,000.

Oshawa, Ont.—A Detroit machinery firm may build a plant here, employing 700 to 800 hands.

London, Ont.—A new plant, 400x200 feet, two storeys high, and employing 150 to 300 men, will be built by the Royal Motor Co.

Sydney, N.S.—Construction work, costing $200,000, will be done on the Cape Breton Electric Co.'s system. This includes additional machine shop equipment.

St. Catharines, Ont.—It is believed that the American Ammunition Co. will build a plant in this vicinity.

St. John, N.B.—The Maritime Motor Car Co. is erecting a plant at Coldbrook, N.B., for the manufacture of automobiles.

Kingsville, Ont.—R. F. Greene & Co. will erect a building for a foundry and machine shop, for which new equipment will be needed.

Fredericton, N.B.—A foundry and machine shop will be erected here for Willis McPherson.

Regina, Sask.—The Brand Stove Co. will erect a plant, costing $100,000.

Preston, Ont.—Clare Bros. & Co., manufacturers of stoves, ranges, furnaces, etc., are erecting a shop.

Calgary, Alta.—A machine shop, costing $10,0000, is being erected by the Canada Malting Co.

Hamilton, Ont.—The Canada Steel Goods Co., Hamilton, Ont., are making additions to their factory.

Orillia, Ont.—Fire on Tuesday, Jan. 6, completely destroyed the premises of the Canada Refining and Smelting Co., with a heavy loss. The plant will rebuild on a larger scale.

Toronto, Ont.—The Gurney Foundry Co. are building a new core room at their Toronto Junction plant at a cost of $40,000.

Ottawa, Ont.—The plant of the Aluminum Castings, Ltd., at Bayswater, Ont., is approaching completion, and will be in operation shortly for the manufacture of aluminum, brass and bronze castings. The company has sufficient business in sight to warrant the engaging of a force of approximately 100 men.

MUNICIPAL.

Brandon, Man.—The civic power committee are considering the erection of a power plant at a point eight miles east of the city. City Engineer Speakman is a member of the committee.

Galt, Ont.—The Town Council has passed a by-law providing for placing the control of the local hydro-electric department in the hands of a commission, to consist of two members and the mayor.

Prince Albert, Sask.—It is probable that an expenditure of about $200,000 will be made during the coming year to erect a first-class power and light station.

Sarnia, Ont.—The municipal council are making a preliminary investigation into the possibilities of having hydro-electric current brought into this municipality.

Regina, Sask.—Tenders for the supply and erection of a five million gallon turbine pump and compound condensing vertical engine, will be received by the City Commissioners up to noon of January 29th, 1913. Copy if specifications and conditions may be obtained from R. O. Wynne-Roberts, consulting engineer.

Quebec, P.Q.—The Harbor Commissioners of Quebec have ordered 3 six-wheel switching locomotives from the Montreal Locomotive Works. The dimensions of the cylinders will be 19 in. x 26 in.; the diameter of the driving wheels will be 50 in., and the total weight in working order will be 120,000 lbs.

Galt, Ont.—At the last monthly meeting of the Water Commission, the chairman, Mr. A. J. Oliver, reported that the electric pumps to be installed at the station were nearly completed. He thought the commission was taking too big a risk in keeping the old boiler at the waterworks station, and suggested that a new one be installed at once.

Humboldt, Sask.—Tenders for engines and boilers for the electric light plant and its installation were considered by the council at a recent meeting, and that of E. Leonard and Sons, for $8,750, accepted. The tender for the complete electrical equipment had previously been awarded to the General Electric Co. for $11,725, making the total cost without the power house $20,475.

Calgary, Alta.—The city has adopted a by-law to raise about $1,000,000 for the construction of a high level concrete bridge over the Bow river, and two smaller concrete bridges.

Toronto, Ont.—Works Commissioner Harris has recommended to the Fire and Light Committee that the Dundas Street bridge be reconstructed, to allow the railway tracks to be moved to the centre.

Toronto, Ont.—A number of British financiers have approached the Board of Control with a scheme to place 150 motor buses on the streets, within six months after an agreement is signed by the city. The capitalists ask for a seven year franchise, promise to form a company with a capital of $500,000, the Mayor of Toronto to be a member of the directorate.

St. John, N.B.—Work has begun on the extension of the water and sewerage system in Adelaide Street. This work will cost $20,000. The outlet for the sewer will be at Newman's Brook, and to reach this a pipe 1,500 feet long must be laid, much of it through solid rock.

Welland, Ont.—The contract for the sewer to the Empire Cotton Mills has been let by the town council to W. G. Somerville and Sons, for $5,446.90. The work is to be completed within four weeks.

ELECTRICAL.

Montreal, Que.—The Montreal Merchants' Telephone Co. has applied for a winding-up order.

London, Ont.—Pay-as-you-enter cars will be introduced here early this spring. Part of the machinery for the new power house has arrived.

Saskatoon, Sask.—The first street car through the central portion of the city passed over the lines on Monday, December 30.

New Westminster, B.C.—A contract has been made by the city with the B. C. E. R. Company for power, at 1.25 cents per kilowatt hour.

Toronto, Ont.—This city and the municipalities in York County are considering the construction of an electric railway to Markham.

Toronto, Ont.—The Hydro-Electric Commission is negotiating on behalf of North Bay for the plant of the Nipissing Power Co. on the South River.

Regina, Sask.—About 350 arc lights will be installed on new streets at a cost of $33,250.

Fort Francis, Ont.—Tenders for a telephone system for this town will be received by the town clerk, up to February 1.

Toronto, Ont.—The Trades and Labor Congress are urging the Ontario Government to control and operate the telephone systems in this province.

Ottawa, Ont.—The Ottawa Electric Railway Co. contemplates street extensions for next spring requiring an outlay of $30,000. Twenty new pay-as-you-enter cars of steel construction are being built to cost $160,000, and a steam auxiliary turbine has been ordered for the power plant at the Chaudiere at an estimated cost of about $200,000.

Toronto, Ont.—The civic electric car line at East Toronto was opened on Wednesday, December 18, Mayor Hocken driving the first car.

Windsor, Ont.—A contract was signed at a special meeting of the city council, December 20, for 2,500 horsepower from the Hydro-Electric Commission at a rate not more than $38. Work on the transmission line from St. Thomas will begin when the weather is good, and the power will be turned on not later than a year hence.

Newmarket, Ont.—A vote will be taken on the proposal to grant a bonus to a shoe factory, at the end of January. The town is divided into two camps, those favoring the installation of power from the Metropolitan Railway, and a large number who stand out for Hydro power.

St. Mary's, Ont.—The town secretary has written to the Hydro-Electric Power Commission of Ontario, asking that power be supplied to towns and villages of Kirkton, Woodham, Granton, Lucan, Ailsa Craig, Centralia and Exeter from St. Mary's sub-station. It is estimated that these places could use 400 horsepower.

Prince Albert, Sask.—This city will spend $150,000 to $200,000 this year on a first class power and light station.

Port Arthur, Ont.—The Marconi wireless telegraph station here will be replaced by one of three times the capacity. The present station is equipped with a 2 k.w. set, while the new station will be equipped with one of 5½ or 6 k.w. The voltage will be increased from 25,000 to 70,000. A new generator will be installed, and the radius of communication extended to between 300 and 400 miles.

Galt, Ont.—A charter has been applied for by the Dominion Power and Transmission Co. to extend the Brantford line twenty miles to this town. The contemplated route will be from Langford, through Brantford, Ancaster, Beverly, North and South Dumfries to Galt. The undertaking will cost $170,000.

Prince Albert, B.C.—The long distance telephone line from here to Melfort has been completed. The line may soon be extended to the Manitoba border.

Sarnia, Ont.—The new wireless under construction by the Dominion Government at Point Edward is nearly ready for business. The station will be operated by the Marconi people on a percentage basis.

Brampton, Ont.—With the arrangement for 50 h.p. for a new mill, Brampton has sold the total amount of Hydro-Electric power contracted for from the Commission. They have also applications from the Copeland-Chatterson Co. for 50 h.p.

GENERAL MANUFACTURING.

London, Ont.—An American paper manufacturing company have secured options on land in Chelsea Green for a factory.

Toronto, Ont.—The assignment of the American Tire Co. and the Motor Cycle and Equipment Co., of Canada is announced.

Ottawa, Ont.—The Surani Oil Fields, Ltd., have been incorporated with a capital stock of $200,000, with headquarters at Toronto.

Cobalt, Ont.—The Abitibi Pulp and Paper Co., capitalized at $5,000,000, will build its factory at Iroquois Falls.

Ottawa, Ont.—Sir Alexander Binnie and Dr. Houston, two British water experts, have been engaged to report on the best supply of pure water for this city.

Montreal, Que.—Plans have been approved for the new gas plant for the Montreal Light, Heat and Power Co. in Cote St. Paul. It will cost between two and three millions.

Calgary, Alta.—Fire did a million dollars damage to the plant of the P. Burns Packing Co. on Sunday, January 12. Installation of machinery on a new plant at Calgary is being rushed to cope with the business.

Lethbridge, Ont.—If guaranteed power at $15 per h.p. per annum, the Ellison Milling Co. promise to double the size of their barrel plant and erect a terminal elevator.

Owen Sound, Ont.—The Dominion Linseed Oil Co. will resume the operation of their plant here, after being closed down eight years.

Winnipeg, Man.—During 1913, the C.P.R., G.T.P. and C.N.R. will build altogether 2,700 miles of additional trackage.

Orillia, Ont.—Mr. F. J. Beharriell, of Toronto, proposes to manufacture bricks here, employing about forty hands. He is purchasing a water power near Washage, which he will use.

Cobalt, Ont.—A powder factory four miles west of here, manufacturing dissitrolite, was burned to the ground December 23, following the explosion of an electric light bulb. The company is a Toronto concern. Damage amounting to $10,000 was done.

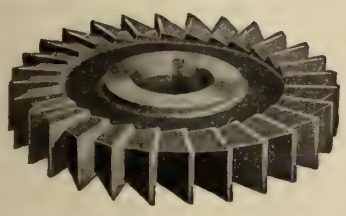
Montreal, Que.—A digester in a sulphite mill at Grand Mere exploded on December 22, and killed four men. It was owned by the Laurentide Company.

Arnprior, Ont.—If 130 girls could be guaranteed for a mica factory, the Loboro Mining Co., a branch of the General Electric, Ltd., promised to open a branch here. The Board of Trade found the girls. A larger factory may be erected here later.

Regina, Sask.—The mill to be erected here by the Regina Flour Mills, Ltd., will be six storeys in height, and will also include subsidiary buildings, elevators for storage of grain, a power house, a cooperage plant, and dwellings for the chief officials. The estimated cost is $500,000. Only two local men, Mr. E. D. McCallum and Mr. H. T. Hunter are interested; the remainder of the promoters are British flour dealers.

Medicine Hat, Alta.—A plant for the manufacture of heavy wrapping paper, strawboard, sheathing paper from straw discarded by farmers, will be erected here by two Calgary men. The plant which will require ten acres of land, will be two storeys high, and will cost nearly $150,000. Some concessions have been made to the firm by the town.

Estevan, Sask.—The Great West Brick and Coal Company has bought the Bastian property, south of the river, and will manufacture pressed brick, tile hollowware, and other clay products. The company is capitalized at a quarter of a million dollars.



Norwich, Ont.—The Borden Condensed Milk Co. are arranging to establish a branch factory here. They are anxious to have assurance that 200 farmers will bring milk to them if they do so the Dominion Canners contemplate the erection of a plant here too.

Port Arthur, Ont.—This city will probably get a nail factory in the near future. The conditions contained in a resolution of the council are satisfactory to the directors. Mr. Bruitnell is at the head of the concern.

Saskatoon, Sask.—A large English automobile manufacturing concern intends to establish a factory here, if satisfactory arrangements can be made with the city. It is their intention to turn out motor cars of value from $500,000 to $1,000,000 per annum, and to have a staff of 200 men or more. The name of the company has not been made known.

Vancouver, B.C.—Work on the brick plant of the Heaps Company at Ruskin, has commenced. It will be equipped with the most modern brick making machinery.

Brantford, Ont.—The Dominion Cycles, Ltd., headed by H. B. Rowell, of Chicago, and capitalized at $200,000, will establish here at the corner of West and Dundas Streets, where

National Cutters

Will increase the efficiency of your men and your machine.

Will give the longest and most satisfactory service.

They are made from the highest stock by the most approved methods and are fully guaranteed. A trial will convince.

they will build a modern factory. The firm will manufacture auto cycles.

Sydney, N.S.—The Nova Scotia Shoe and Leather Co., Ltd., will erect a shoe factory here, costing $20,000, and employing 100 persons, if the city will grant certain concessions.

Russell, Ont.—The Russell Chemical Co. intends erecting a building for the purpose of manufacturing chemicals.

Welland, Ont.—The Bemis Bag Co., Boston, Mass., has secured a site here and will erect a factory for the manufacture of cotton bags.

Regina, Sask.—The Regina Storage & Drying Elevator Co. has been incorporated here, and will erect a storage and drying elevator. The company is capitalized at $1,000,000.

Montreal, Que.—The Ontario National Brick Co. will equip an extensive plant for the manufacture of terra cotta, tile and building supplies.

Blenheim, Ont.—The British Columbia Canners' Co. is having plans prepared for a large factory here, for which the latest equipment will be purchased. John Wall, Hamilton, Ont., is the manager.

Galt, Ont.—The Galt Shoe Co., Galt, Ont., is having plans prepared for a four-storey addition to its present plant. Wm. Scott, Chapman St., Galt, is the architect.

London, Ont.—The Eisendrath Glove Co., Chicago, plans to establish a branch factory at London, Ont.

Swift Current, Sask.—The Ford Milling Co., Swift Current, Sask., is having plans prepared for a new mill, having a daily capacity of 1,000 barrels. Modern machinery will be installed. W. Ford is the manager.

Uxbridge, Ont.—The tannery of Beal Bros., Ltd., was destroyed by fire on the morning of Dec. 18, the damage amounting to $75,000. The water pressure was light, owing to the main pump being out of commission. Worse still, the auxiliary pump stripped its gears in the middle of the fight. The private pump at the tannery could not be got to work before the flames reached it.

Haileybury, Ont.—Work will soon start on the building of a paper mill here, to employ 750 hands. Mr. M. J. O'Brien is one of the leading spirits in the project.

Port Arthur, Ont.—The city council are considering granting seven acres of land below the wagon works to Mr. R. Brutinel for a wire factory. A pulp manufacturing concern, of which Mr. W. H. Russell is the promoter, is also anxious to obtain a lease on this land.

Nanaimo, B.C.—The Nanaimo Pressed Brick and Terra Cotta Co. have begun operations at their yards at East Wellington, where they have 65 acres of very fine shale clay. The capacity of the plant at present is 20,000 a day. Seventeen men are employed.

Toronto, Ont.—A six-storey factory, west of their present premises at the corner of Adelaide and Simcoe Sts., will be built by Messrs. Saunders, Lorie and Co., jewellers. It will be of reinforced concrete, and will cost $70,000. Workmen are now engaged tearing down the buildings already on the site.

Medicine Hat, Alta.—The city has a free site and an option on other land to the Alberta and Saskatchewan Paper and Strawboard Products Co., Ltd., of Calgary, who will erect a factory here, costing $150,000. It will be located near the Crayon factory.

Toronto, Ont.—The Goodyear Tire and Rubber Co. will erect a six-storey salesroom and office building near the corner of Simcoe and Richmond Sts., for $100,000.

The Northern Electric Co. will erect a $100,000 building on Simcoe Street, between Richmond and Adelaide streets. This will be a factory and a warehouse.

The National Cash Register Co. will establish a $300,000 plant on Christie Street in the spring. It will comprise three structures, two storeys high.

SAW AND PLANING MILLS.

Proctor, B.C.—The planing mill of the Wattsburg Lumber Co., which recently was destroyed by fire, will be rebuilt.

Waterloo, Ont.—The Board of Trade has recommended the Council to accept the proposition of Reitzel Bros., contractors, who offer to erect a planing mill and sash and door factory in Waterloo worth $36,000, if the town will loan them $20,000.

Vancouver, B.C.—The Vancouver Harbor and Dock Extension Co., Ltd., Greater Vancouver Co., Ltd., and the Pretty Timber Exchange, Ltd., have established themselves in handsome offices in the recently completed Dominion Trust Company building at the corner of Pender and Homer Streets.

Weyburn, Sask.—Their business has developed so rapidly that the Weyburn Sash, Door and Glass Co. have arranged to take in another area equal to that now occupied. The factory will then employ 40 men.

Calgary, Alta.—The Riverside Lumber Co. will proceed at once with the construction of one of the largest box and sash and door factories in the West. The factory will be

two storeys high, will cost with equipment over $250,000, and should be ready for operation by August next. About a thousand men will be employed. There is some talk of the company putting in the necessary equipment to build street railway cars.

Sarnia, Ont.—The Hub and Spoke Works and Bent Goods Factory of Loughead Bros., were destroyed by fire on Tuesday, Nov. 16. The origin of the fire is unknown. The loss is estimated at from $100,000 to $150,000, with small insurance. The factory gave employment to about 50 men, all of whom are now out of work.

Sicamous, B.C.—The Columbia River Lumber Co., owners of the sawmill at Kualt, which is being dismantled, will resume and rush work on their new mill here.

Melfort, Sask.—The engine of Finger's planing mill at Le Pas having proved not powerful enough, a new one of 500 h.p. will be installed during the winter months.

Victoria, B.C.—Messrs. Lemon, Gounason & Co., Ltd., a local lumber concern, will erect a compressed fuel factory on Gore road. The refuse from their lumber mill will be used to manufacture the fuel. The plant will cost $27,000.

Winnipeg, Man.—The storage and Forwarding plant just completed for Messrs. Turner and Walker, cost $100,000. It is four storeys high, and has a deep basement. The foundations have been built to carry five additional storeys.

NEW INCORPORATIONS.

Montreal, Que.—The National Wire Products, Ltd., Montreal, Que., has been incorporated at Ottawa, Ont., to carry on the business of iron master, wire and steel maker and converter, miner, smelter, engineer, etc. It is capitalized at $1,500,000, and has the following incorporators: George Vipond Cousins, Ida H. McKerracher, Winnifred Evelyn Patch, Patrick Francis Brown, William Reuben Ford, all of Montreal.

Montreal, Que.—John Round & Son, Ltd., Montreal, Que., has been incorporated at Ottawa, Ont., with a capital stock of $500,000 to manufacture and deal in electro-plated and other plated goods and steel cutlery of all kinds, electric fixtures, etc. The incorporators are Messrs. John Ross Somers McLernon, manager, Arnold Wainwright.

Toronto, Ont.—Foreman Motor & Machine Co., Ltd., Toronto; capital $40,000; provisional directors, George H. Foreman, Wm. J. Brown and Thomas H. Sharp.

Ottawa, Ont.—Lecky & Colis, Ltd., Ottawa, Ont., will deal in railway, mining and contractors' machinery and supplies. It has a capital stock of $50,000, and has been incorporated by William Stanley Lecky, William Robertson Rowatt, Charles J. R. Bethune, Norman G. Larmonth and Philip H. Chrysler, all of Ottawa.

Ottawa, Ont.—The Inventor's Machinery Co., Ltd., Ottawa, Ont., will have a capital of $40,000, and the following incorporators: Maurice Alexander, Darley B. Smith, Alfred LaBelle and Jean Gustave Mignault, all of Montreal; and Jennie Louise Lawrence, Westmount, Que. It will manufacture all kinds of machinery and hardware specialties.

CALENDARS RECEIVED.

Mussens, Limited, with offices in Montreal, Toronto, Cobalt, Winnipeg, Calgary, and Vancouver, have, as it were, a machine for every day in the year. Their calendar is of unusual size, every page of which is a study in machinery.

The Boye & Emmes Machine Tool Co., of Cincinnati, O., take the opportunity on their new 1913 calendar which we have received, to show twelve examples of their well known lathes. It is printed on white, smooth paper, in black and red.

White and Wyckoff, of Holyoke, Mass., manufacturers of "Autocrat" and "W. & W." stationery, have issued a calendar that is notable for its practical and artistic value. Holidays are marked distinctly, as well as important dates in United States history.

The James Robertson Co., Ltd., Montreal, are giving away a very attractive souvenir to their customers. It is a combined glass paper weight, calendar and pen holder. The calendar is visible through the glass. This novelty is extremely useful, and will be sent free to all users of "Babbitt," who write on the firm's letterhead.

The National Machinery & Supply Co., Ltd., Hamilton, Ont., are distributing an attractive calendar which will appeal especially to lovers of animals,—may their numbers ever increase! The calendar, which measures 22 x 13 in., makes a handsome decoration for any office. At the top is a striking picture of a horse, while below is printed the well known "Prayer of a Horse." appears on the calendar beyond the bare name of the firm, who are the makers in Canada of the Yost solid jaw and swivel bottom machinist's vise. The firm was formerly known as the Canadian Yeates-Gordon Co.

The American Steam Pump Co., Battle Creek, Michigan, manufacturers of Marsh and American steam and power pumps and compressors, have issued a calendar for 1913.

CATALOGUES RECEIVED.

We have received from the **Canadian Consolidated Rubber Co., Ltd., Montreal,** catalogues entitled "Mechanical Rubber Goods," "Moulded, Miscellaneous and Plumbers' Rubber Goods," and "Fire Hose and Supplies." The Mechanical Goods catalogue illustrates their belting, packing, sheet packing and gaskets, also various lines of hose. It is superbly illustrated with two color half-tones, and is extremely well gotten up in every way. It contains almost a hundred pages, and copies will be sent on request.

The Grinnell Automatic Sprinkler Bulletin, issued on the first of the new year, is as entertaining as a bulletin can possibly be. It is also convincing. After reading it, one is impressed with the fact that fires and Grinnell sprinklers are opposites. Photographs are used to prove this.

Schmid's Patent Automatic Water Finder & Engineering Co. of London, have sent us a bulletin, dealing with their water finder, invented by Adolf Schmid, of Berne, Switzerland. Their claim is that this is the only apparatus based upon physical principles capable of discovering subterranean water courses or "springs." It works on the principle of indicating the strength of the natural electric terrestrial currents existing in the upper layers of the earth, there being in connection with these currents an interchange of electricity between the atmosphere and the ground.

Ideal Case-Hardening Compound Co., New York, have issued a book of useful information and practical rules regarding case-hardening, pack-hardening annealing of steel. All that is claimed for this little work is that it adds a brief general discussion to the treatise on case-hardening, as well as several definite examples and figures. The rules and instructions given are based not alone on accepted theories, but above all on the best practice in the leading shop and factories. The booklet tells how the Ideal Case-Hardening Compound is used.

Liberty Manufacturing Co., Pittsburgh, say in a recent pamphlet dealing with boiler tube cleaners: "All owners and operators of steam boilers know that better results can be obtained when their boilers are clean, but few realize the extent of fuel losses caused by scale, while still fewer think of the danger of operating boilers that are dirty. We are in position to supply tube cleaners to meet all conditions, and when the character of the material, workmanship and power developed by Liberty Cleaners is taken into consideration, there is no machine on the market at any price that will do the work of the Liberty, which is standard the world over."

C. A. Dunham Co., Ltd., Confederation Life Bldg., Toronto, have mailed us an attractive pamphlet setting forth the merits of the Dunham vacuum traps for steam heating systems. This trap, as is generally known, is of the hollow disc thermostatic type, and will work between wide limits of pressure, being guaranteed to operate satisfactorily between 20 inches of vacuum and 10 lbs. pressure. Other points in favor of this interesting trap are strongly brought out in the pamphlet under notice, and will appeal to architects, heating engineers and others. A copy will be mailed to anybody interested.

"Scale Removal from Condensers" is the title of an attractive catalogue recently issued by the Lagonda Mfg. Co., of Springfield, Ohio. This book is more than a catalogue, as it contains a very interesting discussion showing the harmful effects of scale in condensers, how it decreases vacuum and increases the power of the auxiliaries. Interesting curves are also included, showing the increased steam consumption resulting from the accumulation of scale in surface condensers. The extracts from numerous letters from engineers contain some surprising information as to how a comparatively small amount of scale in condensers will decrease the operating efficiency of a plant. Any engineer who has had trouble with low vacuum would do well to read this catalogue, as it may point out to him that this trouble is due to a source that he has least expected. The removal of scale and other deposits from ammonia condensers, evaporators, etc., is discussed, and a complete line of cleaners illustrated for use in various kinds of condensers. Copies of this Catalogue No. 0-1 may be had by addressing the Lagonda Mfg. Co., Springfield, Ohio.

Thos. H. Dallett Co., Philadelphia, Pa., have forwarded a copy of their Bulletin No. 303, which describes the well known Dallett "Quick Action" hose coupling. This hose coupling is so very popular with users of

pneumatic tools as to need no extended description here.

Whiting Foundry Equipment Co., Harvey, Ill., have mailed us Catalogue No. 99, entitled "Foundry Cranes and Equipment." The catalogue covers, in condensed form, the various cranes and other appliances used in grey iron, brass, car wheel, pipe, steel and malleable foundries. A copy will be mailed to anyone interested.

The Alberger Pump & Condenser Co., New York, have issued Bulletin No. 3, dealing with "Wainwright" apparatus from the practical viewpoint. In connection with heating apparatus, it tells how their corrugated tube gives maximum heating results. It mentions also the spiral flow tube, and goes fully into water heaters of various designs. The bulletin also describes the working of the Alberger circulating pump, their steel expansion joint, and the "Wainwright" turbine expansion joint. Catalogue D, by the same firm, is published on good paper, and is well worth sending for because of its excellent drawings, photographs, and descriptions of centrifugal pumps and steam turbines. Several pages are occupied simply describing the development and theory of centrifugal pumps. The article is illustrated with head, efficiency and power curves. A brief outline of the uses to which centrifugal pumps are now exclusively applied is given, occasion being taken to show how well these manufactured by the Alberger Pump & Condenser Company last under different conditions.

Manzel Brothers Co., Buffalo, N.Y., have favored us with a copy of their catalogue No. 15, descriptive of their automatic force and sight feed oil pump, class "HA," for lubricating the cylinders of steam engines, steam pumps, gas engines, steam feeds, air and ammonia compressors, plunger elevators, etc. Their claim is that this pump will give positive lubrication under any and all conditions, no matter how slow the engine runs, what pressure of steam is carried, how high or low the temperature, or what grade of oil is used.

James Walker & Co., Ltd., New York, is an English firm manufacturing packings and jointings. In a catalogue we have just received from them they advise engineers ordering "Lion" packing to be sure and get the exact size. Their packing, they say, is not of the nature of some packings, easily compressible, therefore, callipered sizes of rod and box must be given when ordering. They warn purchasers to look for their brass labels and the "thin red line" running through the packings.

The Tabor Mfg. Company, Philadelphia, Pa., have sent us Bulletin "M-H," which is handsomely got up, with clear photographs and reading matter. The bulletin deals exclusively with the Tabor Roll-over Molding Machines, which are made in three types—Hand Roll-over, hand draft; Power Roll-over, hand draft; and Power Roll-over, power draft. The smaller sizes are adapted to handling work which one or two men can roll over and remove from the machine, while the larger sizes which roll over the molds by power are usually served by a hoist or crane. These machines are essentially for drawing the pattern perfectly, and are designed to handle a class of work hitherto not adapted to machine molding, on account of hanging sand.

Canadian Westinghouse Company, Ltd., Hamilton, Ont., have issued from their Railway and Lighting Department, circular No. 1094, a valuable little booklet on Westinghouse Turbo-Alternators. Since this company commenced building turbo-generators, there has been a complete revolution in the design of electric power plants. A 10,000-kilowatt turbo-generator set, readily fits into the space required by a reciprocating engine-driven set of one-third the capacity, and the average price is no greater. The greater part of this circular is confined to a description of steam turbines of the simple-flow, impulse and reaction single-flow, double-flow, semi-double-flow types, and to special turbines. Details of construction are also gone into closely. Another circular sent to us by the same company shows how their little motor can be applied to sewing machines. It is claimed that it costs less than one-half cent an hour to use this motor. Another booklet issued by the Westinghouse Co. shows a dozen ways in which electricity may be used by the up-to-date housekeeper. The circular is entitled "Electric Ware," and illustrates the coffee percolator, electric iron, traveller's electric iron, toaster-stove, chafing dish, chafing dish blazier, tea somovar, milk warmer, frying pan, etc.

"Facts Concerning the Operation of Taylor Stokers," obtained from the users by the builders, the American Engineering Co. of Philadelphia, who have had these put into book form. From a series of boiler test reports

NOTICE

The undersigned, attorneys for the patentee, are prepared to grant licenses, at a reasonable price, to all desiring to use the method of producing electric oscillations described in Canadian letters patent No. 119,908, issued on the 10th day of August, 1909, to R. C. Galletti. Ridout & Maybee, 59 Yonge Street, Toronto.

50 Pearl Street - TORONTO, CANADA

one can see at a glance how efficient these stokers are.

The Standard Underground Cable Co. of Canada, Hamilton, Ont., have issued a small booklet on their Sterling Rubber Insulated Wire and Cable. One of the objects of this booklet is to explain the company's position as the manufacturer of Standard Products. The Standard Underground Cable Co. of Canada, Ltd., was established so that the rapidly increasing Canadian business of its associate American company, the Standard Underground Cable Co., Pittsburgh, Pa., might be handled with economy and dispatch. Their claim is that Sterling Rubber Insulated Wire is identical in quality with the brand of the same name made by their associate company.

The Griscom-Russell Co., New York, have favored us with a copy of a booklet entitled "The Sterling Destructor." The English system of destroying combustible refuse by high temperature destructors has been adopted in every quarter of the world. Municipalities everywhere are welcoming these more modern and economical ways of handling waste. Of the destructors made on this principle, the Sterling is one, and it is claimed by the makers that it disposes of obnoxious substances without causing a nuisance, and provides an efficient apparatus and method that will do the work at the lowest cost consistent with satisfactory results. The book is profusely illustrated with drawings and photographs.

Dodge Manufacturing Co., Ltd., Toronto, appeal to Canadians through a leaflet entitled "For the Mechanical Man Erecting or Extending Factory or Mill," to insist on having their transmission machinery manufactured in Canada. They assure manufacturers that it is entirely unnecessary for them to buy pressed steel pulleys and pressed steel hangers that are not made in this country. Their policy is not cheapness, but to do a strictly good job.

The Vulcan Engineering Sales Co., Chicago, in Catalogue No. 3, fourth edition, state some of the advantages of the Hanna Type Riveters: "Only one blow to a rivet," "saves time and air," "drives tight rivets," "minimum wear and tear," "predetermined tonnage," and "hole filled and automatically rivet set." A supplement supplied by the same company gives an interesting illustration of the operation of heavy tonnage Hanna Type Pneumatic Riveter.

Escher, Wyss & Co., Zurich, Switzerland, whose head office for Canada is room 514-515, Canadian Express Building, Montreal, Que., have just issued their latest pamphlet relating to Oil Pressure Governors. In it, by means of photographs and drawings, they explain the working of their governor, pointing out how it is remarkable for its simplicity, the small space occupied, the small power required, and its sensitiveness.

BOOK REVIEWS.

"Saw Filing and Management of Saws," by Robt. Grimshaw: The Norman W. Henley Publishing Co., New York, price $1.00. This book has now run to the third edition. It is a practical treatise on filing, gumming, swaging, hammering and brazing band saws. It tells which files to use, and gives useful hints for repairing and caring for saws. In this edition the author has included original "wrinkles" which have developed during his many years' experience in the use of saws.

"Alternating Current Machinery," by William Esty, S.B., M.A., head of the department of electrical machinery, Lehigh University: The American School of Correspondence, Chicago. Price $3.00. This book has been prepared, the author says, with the object of giving the beginner and the so-called practical electrician a working knowledge of alternating current apparatus, in order that he may know how to install and operate it intelligently. Attention is early called to the characteristics of alternating-current problems which cause them to differ from direct current problems. The work is elementary, and the author expresses the hope that the reader will follow it up with study in more advanced text books.

"House Wiring," by Thomas W. Poppe, electrical engineer and contractor: The Norman W. Henley Publishing Co., New York. Price 50c. This is a treatise describing and illustrating up-to-date methods for installing electric light wiring. It is intended for the electrician, helper and apprentice. It aids in solving all wiring problems, and contains nothing that conflicts with the rulings of the National Board of Fire Underwriters. Only practical examples of work are included in this book. The author has treated his subject in a clear, non-technical manner, easily to be understood.

Knots, Splices and Rope Work, by H. Hyatt Verrill, editor of the Popular Science Dept. of the "American Boy Magazine," 150 illustrations; 60 cents: The Norman W. Henley Publishing Co., New York. Doubtless the trailing vines and plants first suggested roses to human beings, and it is quite probable that these same vines, in their various twistings and turnings, gave man his first idea of knots. Mr. Verrill tells of the utility of knots in this volume. A little knowledge of knots has saved many a life in storm and wreck, he says, and if every one knew how quickly and securely to tie a knot, there would be far fewer casualties. The information given should be of value to engineers.

"Brazing and Soldering," by James F. Hobart. Fifth edition, revised and enlarged; illustrated; paper covers, 25 cents. The Norman W. Henley Publishing Co., New York. The terms "brazing" and "soldering" are explained in the author's opening words, and excellent devices for brazing under various conditions are described by him. The first twenty pages are devoted to brazing, and the remainder to soldering. Splendid illustrations of the implements used, and the construction of brazing and soldering furnaces are given.

"An Investigation of Explosion-Proof Motors," by H. H. Clark, has been issued by the United States Bureau of Mines, as Bulletin No. 46. A motor enclosed by a casing so that an explosion of mine gas and air within the casing will not ignite a mixture of the same gas outside the casing, is considered by the Bureau of Mines to be "explosion-proof." Mr. Clark tells in this bulletin how such a motor is constructed. He describes devices for reducing below the ignition point of gas (methane) the temperature of any flames that may be discharged from the motor casing. The investigation described in this bulletin was undertaken by the Bureau of Mines for the purpose of ascertaining methods of lessening the risks attending the use of electricity in mines. Various makes of motors were tested, no two being protected in the same manner. The bulletin is illustrated with photographs and drawings.

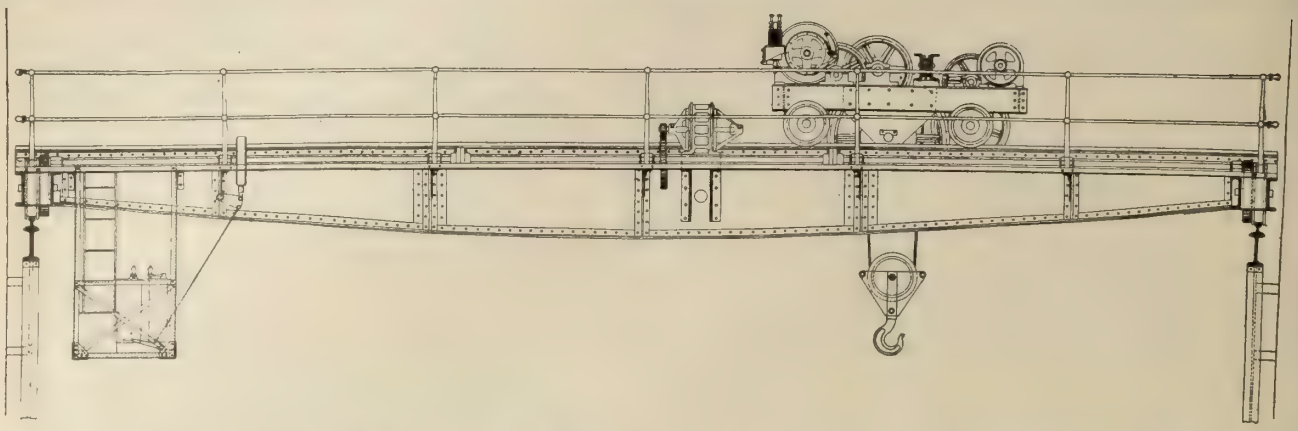
"BAWDEN" STEAM PUMPS

MANUFACTURED UNDER ATTWOOD'S PATENTS

SIMPLE AND COMPOUND, For all Purposes



No Tappets.
No External Valve Gear, Levers or Springs.
No Internal Tubes.
No Internal Stuffing Glands.

"Bawden" Pumps are governed by piston valves which are controlled by the action of live steam only.
—Simplicity throughout.
—Guaranteed to make full stroke under constant or varying loads.
—Valves, latest improved steam balanced type.
—Greatest economy of steam consumption.
The Bawden Pump provides the simplest, most economical and reliable means for feeding high or low pressure boilers.
Flexibility of speed obtained without any mechanical adjustment.
Automatic cushioning of piston and valves ensures greatest safety in any emergency.

Standard Three-Motor Electric Overhead Travelling Crane

We build Cranes of all kinds---of all sizes---for all purposes.
This is our Standard Three-Motor Overhead Travelling Crane.

¶ All parts well proportioned and of rigid construction, giving large factors of safety.
¶ Over-winding device. Gears all machine cut. All parts standard and interchangeable.
¶ Fitted with liberally-rated, slow-speed motors and improved tramway type controllers.

Detailed Specifications and Prices submitted upon request.

JOHN T. HEPBURN, Crane Builder, Iron Founder and Machinist

18-40 Van Horne Street, Toronto, Can.

"VICKERS" Electric Crane Equipments.

MOTORS. Fitted with Auxiliary Poles. Liberally rated, they may be subjected to severe intermittent overloads without trouble. All parts of ample section.

CONTROLLERS. Powerful Magnetic Blowout to each finger. Insulation is fire-proof and non-hygroscopic. Connections readily accessible. Special types for Foundry Cranes, etc.

PANELS. Contain Main Switch, Main Fuses and Motor Fuses in substantial iron case. Specially designed for Crane service.

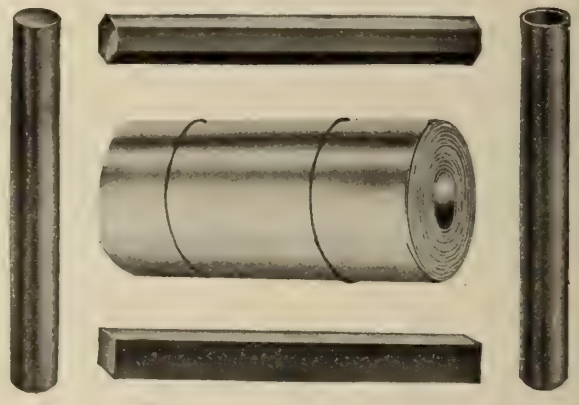
Universal Danger Signal

Because of its unusal design and color scheme this signal does away with the necessity of printing signals in different languages for non-English speaking employees. Once explained to them by one in authority it is indelibly impressed upon their minds for all time.

This Signal is indestructible, the colors of Enamel being fused on a sheet of Charcoal Rolled Steel under 1600 degrees of heat, and guaranteed to withstand all underground mine conditions. Men moving from one camp, state or country to another always recognize and obey this signal.



Made in any size desired—the following sizes in stock.

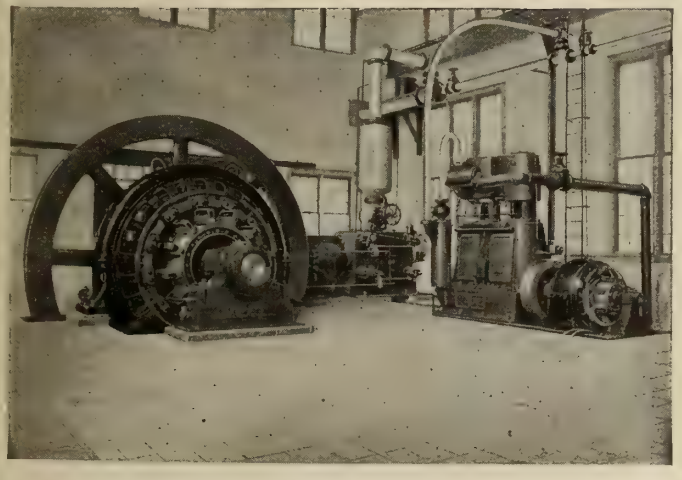
ROBB VERTICAL TAPER COURSE BOILER

A Space Saver—
It's the small floor space—the smallest floor space—per horse-power that gives the vertical boiler the advantage for limited areas.

A Coal Saver—
It's the economy and the continued economy that has caused the vertical boiler to be so widely used. It's internally-fired—saves radiation losses. Its passages for the hot gases are direct—insures good draft. It has large combustion chamber surrounded by heating surface—perfect combustion.



A Trouble Saver—
It's the ease of inspection and cleaning that cuts down the cost of maintenance. Carrying up the shell the full diameter to a point about six feet above the crown sheet allows a man to walk around the edge. Handholes placed opposite the wide cleaning spaces make it easy to wash off the crown sheet without removing the manhole plate.

MEN IN CHARGE

OWNERS SUPERINTENDENTS
MANAGERS FOREMEN
PURCHASING AGENTS

¶ These are the men you want to reach with your advertising.

¶ There is a reason why CANADIAN MACHINERY AND MANUFACTURING NEWS is THE medium you should use in a large way to reach these men.

¶ Given a good journal—well edited, illustrated and well printed, the paid-up circulation would be small were not a vigorous campaign carried on, both by mail and personal work.

¶ CANADIAN MACHINERY is well edited, well illustrated and well printed—the one source in Canada of timely, reliable, first-hand information to mechanical men.

¶ But we are not satisfied with simply publishing a good journal. Our thoroughly-trained, salaried subscription men are out hustling for subscriptions in every province of Canada—and getting the business, or we want to know the reason why. In addition, we are represented in practically every railroad shop and other large shops by special agents, who are well paid for every order sent in—and every mail brings orders from these men.

¶ No machine shop, foundry or metal working shop of any class, whether large or small, is overlooked by our subscription plan.

¶ Above is one GOOD reason why you should not overlook this journal as your strongest aid to more business in 1913. There are many others.

Want to talk it over? Write us.

This Milling Machine produces parts of machines, tools, typewriters, phonographs, guns, electrical instruments, etc., accurately and at a rapid rate.

In manufacturing such pieces the advantages of a machine of stiff construction and convenient design, so that it can be rapidly operated, are highly important. Such advantages are to be found in the

No. 12 PLAIN MILLING MACHINE

A careful study of the illustration reveals the strong, compact design of the machine, as a whole. Note the length of the table bearings; the solid spindle head that contains the spindle bearings; the massive overhanging arm, intermediate arbor support, and braces that bind the arbor and overhanging arm solidly to the base of the machine. All these points conduce to great rigidity and consequently to accuracy in producing work at fast rates.

In connection with the convenient arrangement of parts to facilitate quick manipulation, note the handy position of all controlling levers and handwheel at the front of the machine. The longitudinal table feed is automatic in either direction and the length of traverse is controlled by adjustable dogs that disengage the feed at any desired points. There are six changes of feeds, some of which are suitable for every requirement of finish and production.

Drill Tangs Cannot Twist

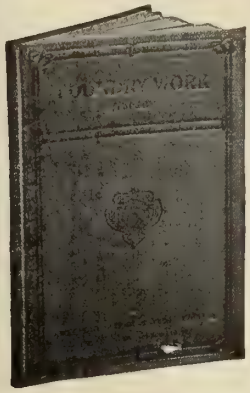
or break off—you'll save mightily on your drill costs—if you adopt the

"Perfect Double Tang" Socket

Has two driving slots instead of one—the lower slot provides for a shank tang 25% to 60% thicker and sturdier than ordinary—That means a shank proportionately stronger and with ample reserve resistance to strain or stress.

Broken tangs of old drills can be ground in a couple of minutes to fit the "Perfect."

All "Cleveland" Drills are furnished to fit it at regular prices.



Folder No. 18-C will interest you.

The CLEVELAND Twist Drill Co.

New York CLEVELAND, Ohio Chicago

You May Have This Book Without Spending a Cent

if you are a subscriber to "Canadian Foundryman," by sending in to us four new paid-up subscriptions. If you are not a subscriber send in your own, along with the proper number of paid-up subscriptions and the book is yours.

Foundry Work

By Wm. C. Stimpson

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

Price, $1.00

Given free with four yearly paid-up subscriptions.

The subscription price is fifty cents per year; two years for one dollar.

CRANES

All Types---For Every Service

Complete Foundry Plants

We make a specialty of complete foundry plants for any class of castings — grey iron brass, car wheel, pipe, steel (O. H. and converter), or malleable. We prepare layouts showing location of all machinery, furnish and install equipment, and conduct initial operation, relieving the customer of all risk. Send for our complete catalogue. Information gladly furnished.

Cupolas	Core Oven Cars	Furnaces (Brass, Malleable & O. H.)	Tramrail systems
Tumblers	Elevators		Turntables
Trucks	Air Hoists	Annealing Ovens	Sand Sifters.
Ladles, Core Ovens	Converters

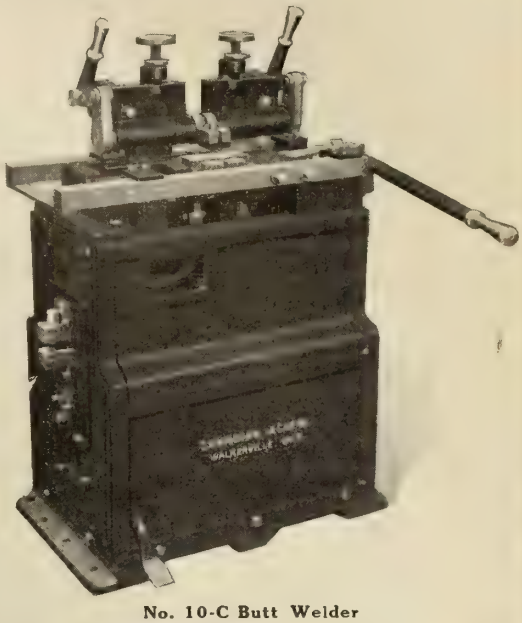
No. 20-D Spot Welder

SPOT and BUTT WELDING MACHINES

Of the Highest Electrical Efficiency



Which Will Do a Given Amount of Work with Less Current Than Any Other Machine of This Type

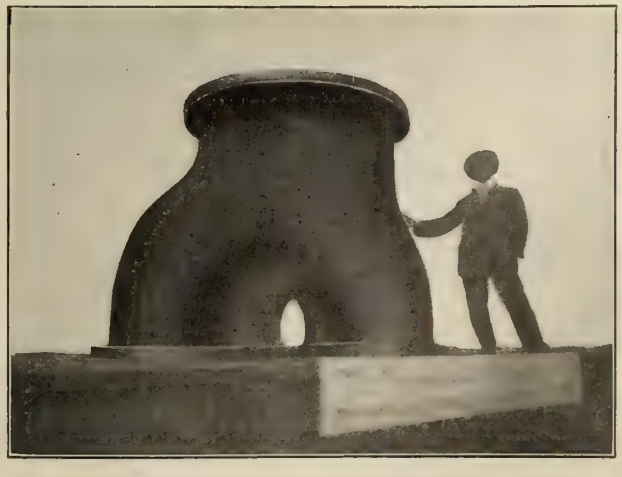
It is not merely a claim that our welders consume less current—it has been proved by actual tests.

We have good facilities for demonstrating this fact, and the intending purchaser who expects to use a considerable amount of electric current should investigate this feature.

We are the pioneer builders of **Electric Welders** in Canada, and we know our machines are equal, if not superior, in efficiency to any foreign make.

They are **strong, convenient, accessible, very durable,** and capable of producing the **highest quality work.** Drop us a card for **descriptive booklet** to-day.

No. 10-C Butt Welder



Agnew Electric Welder Co., Ltd.

WALKERVILLE, ONTARIO

STEEL CASTINGS

Our castings are as perfect and efficient as castings can be, yet they can be procured at a price that will ensure economy.

Let us submit you estimates before placing your next order. Write to-day.

Casting for a 10,500 H.P. Water Wheel.

We make New Process Converter Steel Castings, annealed and unannealed.

We also make Chrome Manganese Nickel Steel Castings.

Made in any size from ¼ lb. to 3000 lbs. and **guaranteed right.**

Dixon Crucibles

EVERY crucible made by DIXON since 1827 has been made with the one idea of giving reliable service.

¶ In doing this nothing has been so helpful as our experience and our study of actual foundry conditions. ¶ In the purchase of raw material, in mixing it correctly, in spinning up the crucible, wherever there has been any question our experience has been called upon to give the final answer.

¶ Write for our booklet No. 223-A on the care and use of crucibles.

Joseph Dixon Crucible Company
Jersey City, N. J.

Which Journal do you use when in the market for Shop Equipment or Supplies?

THIS Directory is run every month at considerable expense for the benefit of our readers—*your* benefit.

¶ You will find listed practically every machine shop or foundry requirement, from twist drills to coach wheel lathes, and from foundry facings to cupolas.

¶ You will find under each heading from one to a dozen names of reliable firms anxious to furnish information for the asking.

¶ Turn from this directory to our advertising pages and study carefully what our advertisers say regarding their product.

¶ You do not derive half the possible benefit from any one issue of Canadian Machinery unless you study the advertising pages.

¶ The most progressive firms *believe* in advertising, and these are the firms who are constantly employing the best designers in order to keep their product thoroughly up-to-date.

¶ In his space, the man who is spending his life perfecting his product, tells you briefly about a few of the outstanding features. It is your privilege to write and get *complete* information, and that information is going to help you get better results.

Refer to Canadian Machinery Directory and Advertising pages---you will help us, the advertisers and yourself.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

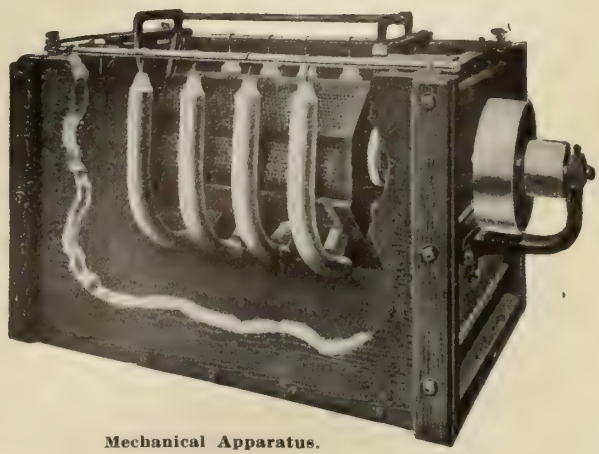
Electro-Plating Apparatus and Materials

GENERAL FOUNDRY EQUIPMENT



We manufacture all classes of plating supplies in Toronto. Prompt shipments.

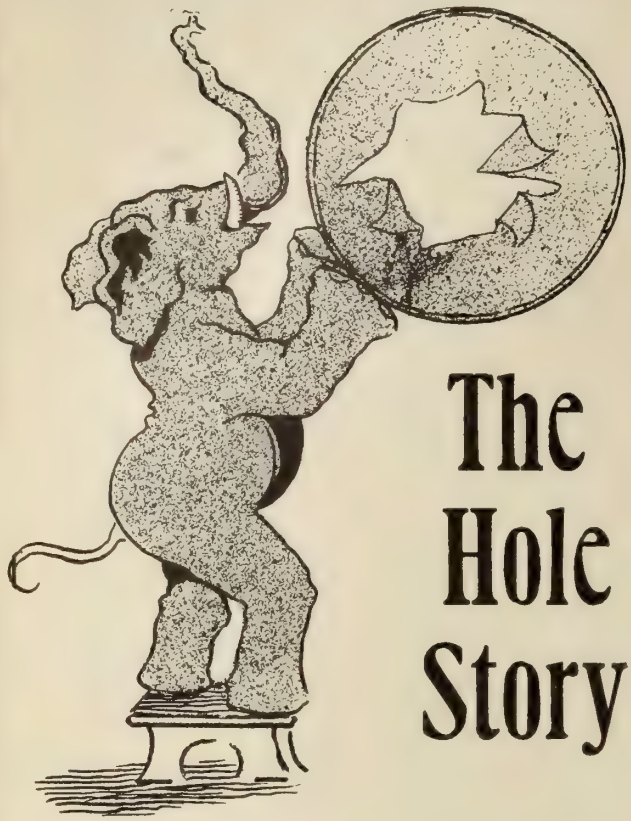
Buffs
Buffing Compositions
Copper Anodes
Brass Anodes
Zinc Anodes
Nickel Anodes
Polishing Wheels
Nickel Salts, Double
Nickel Salts, Single
Nickel Salts, Black
Carbonate of Copper
Carbonate of Zinc
Cyanide of Potassium
Cyanide of Sodium
Pumice Stone
Pure Turkish Emery and Glue
Canvas Wheels
Sheepskin Wheels
Felt Wheels
Bull Neck Wheels
Brass Wire Wheels

Kostico Better than Potash or Caustic Sodas, For preparing work for Plating.

Pickelene Takes the place of acid Pickles. Dry salt, no Injurious Fumes.

Electro Chemical Cleaning Salts

Mechanical Apparatus.



WE ARE THE ORIGINATORS OF AND HEADQUARTERS FOR

COLD GALVANIZING.
AMERICAN PROCESS.
SAMPLES AND INFORMATION ON APPLICATION.

Factories: Morrow Avenue and C.P.R., TORONTO
Eastern Warehouse: 579 St. Paul Street, MONTREAL

The Hole Story

The whole story of the hole in the casting, or that of the cored casting, is well known to all the workers in, and students of, Foundry Practice.

It is the story that was frequently fraught with trouble, notwithstanding there were sundry and divers core-compounds out looking for a market.

When *KING KORE KOMPOUND* came on the Foundry horizon, the trouble vanished, and so did the other compounds.

These other compounds decided it was their bed-time: It was.

KING KORE KOMPOUND is the successful one: it has outlived doubts by cutting core costs in half. Three carloads this month to makers of steel castings; a lot more to makers of grey iron castings; still, I can fill more orders.

To be real honest about it, I need more orders.

The plan of trying it before buying it, is a safe one.

You can follow that plan.

Next!

I Manufacture Foundry Facings, Foundry Supplies, Buffing Compositions and Platers' Supplies.

The Secret of PERFECT CASTINGS

It Peels Clean, Will Slick, Rub or Dust on Mould

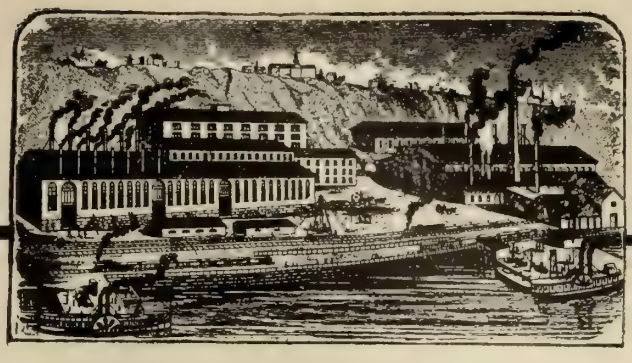
Will Not Roll or Wash

By the use of this Plumbago you will eliminate make-overs, and will turn loss into profit.

Let us send a barrel on approval. If it does not prove absolutely satisfactory, we will take the unused quantity back at our expense and cancel all charges against you.

We also make a higher grade in our No. 46, and a lower grade, No. 47.

Ask us for a barrel to-day.



The Detroit Foundry Supply Co.

Foundry Supplies, Platers' and Polishers' Supplies.

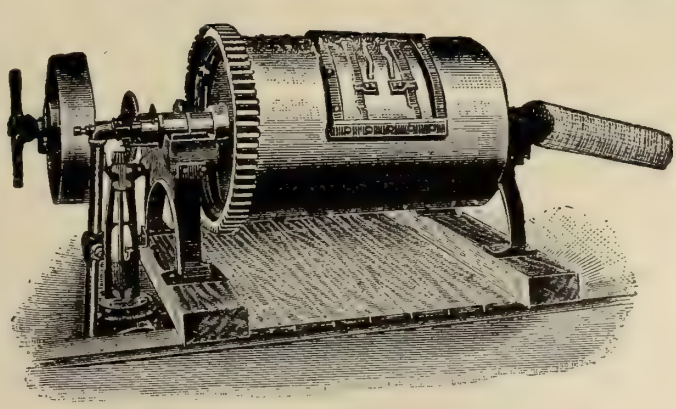
MARINE ENGINES and PUMPS. SHOE MACHINERY A Specialty

BRASS and IRON CASTINGS. BOILERS and REPAIRS.

That we have exceptional facilities at our disposal for the manufacture of all kinds of Machinery —in addition to our business as Brass and Iron Founders, General Contractors and Shoe Machinery Engineers—has been amply proved this year. In the short space of five months, we built and installed all the Engines and Boilers of the new sister steamers "Levis" and "Lauzon," whose trial trips were a complete success. We make a specialty of all kinds of Marine Engine Work, and shall be glad to quote for first-rate products only.

SHOE MACHINERY. Manufacturers of "Non-Royalty" Machines, Metallic and Goodyear, "Fortuna" Skivers, and "Climax" Presses, Sand-papering, Lasting and Loose Studding Machines.

Wire of every description for Slugger and Standard Screw Machines.



The Canadian General & Shoe Machinery Company, Ltd.

ERNEST CARON, Managing Director

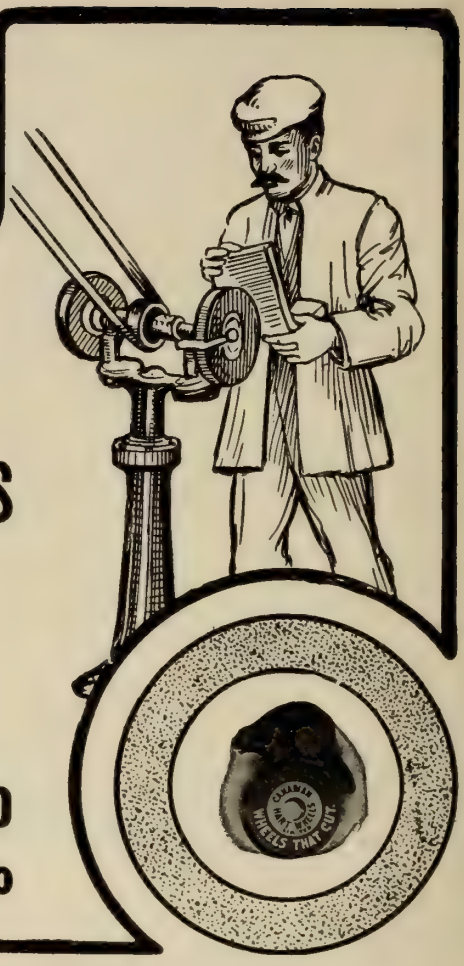
LEVIS, Quebec

A GOLD MINE

SAVE YOUR IRON

SLY'S PATENT IRON CINDER MILL

Patented, No. 514097. Patented, No. 841728.



may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the iron contained in your cupola dump and gangway scrapings and 75% of the coke. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

We also manufacture Cleaning Mills, Dust Arresters, Sand Blast and Foundry Equipment.

THE W. W. SLY MFG. CO., CLEVELAND, O.

The Daily Grind

The daily grind of mechanics engaged in using abrasive wheels is made much more effective if their machines are fitted with

CANADIAN HART CORUNDUM WHEELS

Our wheels are free and fast cutting, porous, safe, and very durable. Send for our catalogue which describes the various processes used in making Canadian Hart Corundum and Emery Wheels.

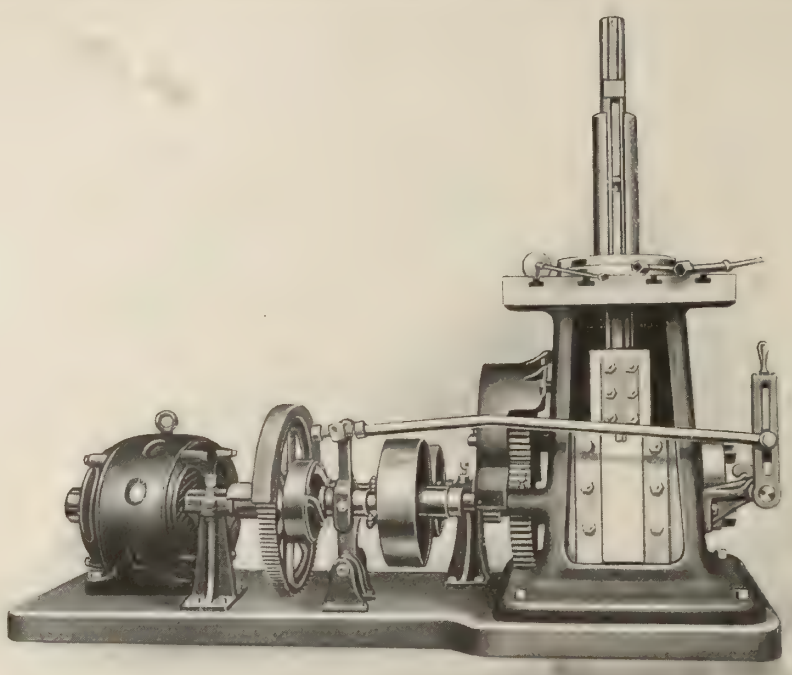
The Lathe of Maximum Production

WE have put into this new Gap Lathe every feature that makes for economical production — speed in changing, accuracy of cut, quality of cut, and solidity of bed.

All parts taking strain are of ample excess size, and all bearings are large. The gap is solidly supported, and is of extra width and depth.



Correspond with us for full particulars. You can instal one or a battery of these machines in any size of gap within wide limits, and in any length of bed. Write us.

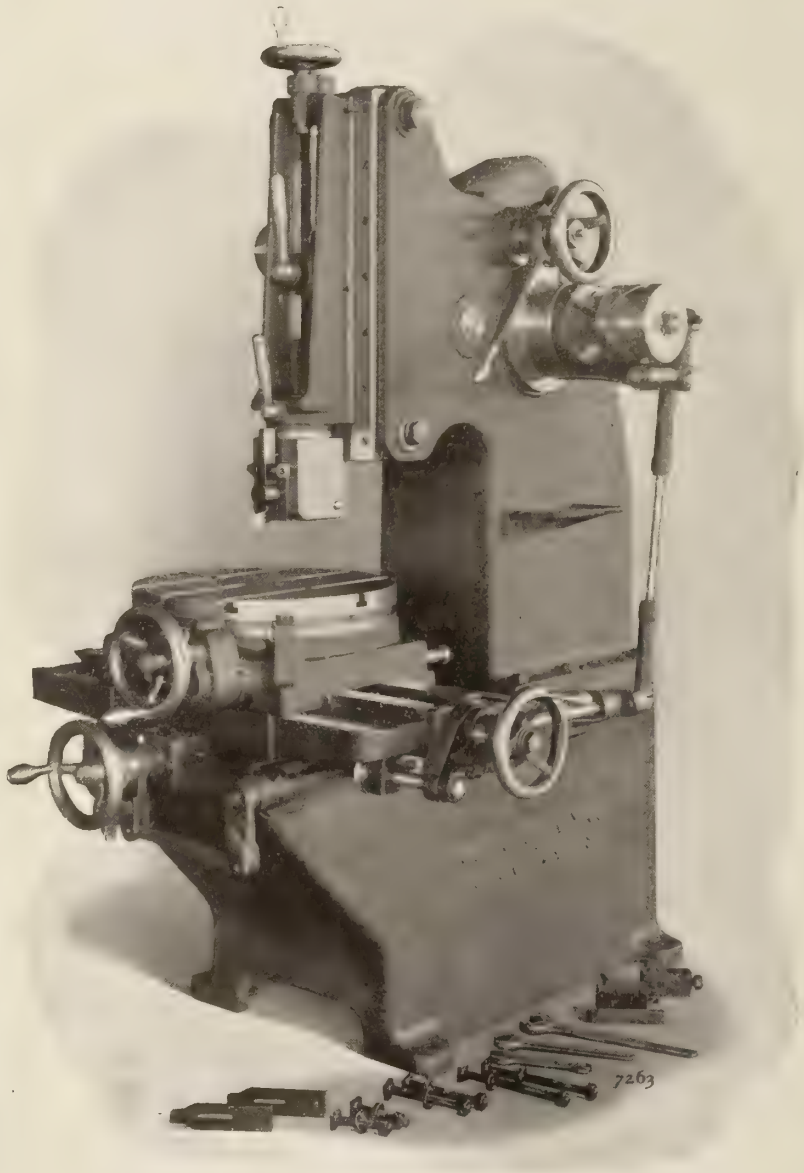
Nicholson made Files

Recognized Everywhere as the Standard of File Efficiency

All users of files know that Nicholson-made Files save time and do accurate work.

We have four thousand kinds of Nicholson-made files—all workers of metal will want one for their particular purpose.

Nicholson-made Brands manufactured in Canada are:



"AMERICAN," "ARCADE," "GREAT WESTERN," "GLOBE," "EAGLE," "McCLELLAN," "KEARNEY & FOOT," "J. B. SMITH."

Get them from your jobber.

NICHOLSON FILE CO.
PORT HOPE, ONT.

The One Tool You Have Always Needed In Manufacturing and Tool Room Work

Those features which you have felt the need of in a machine of this type are combined in the

P. & W. Vertical Shaper

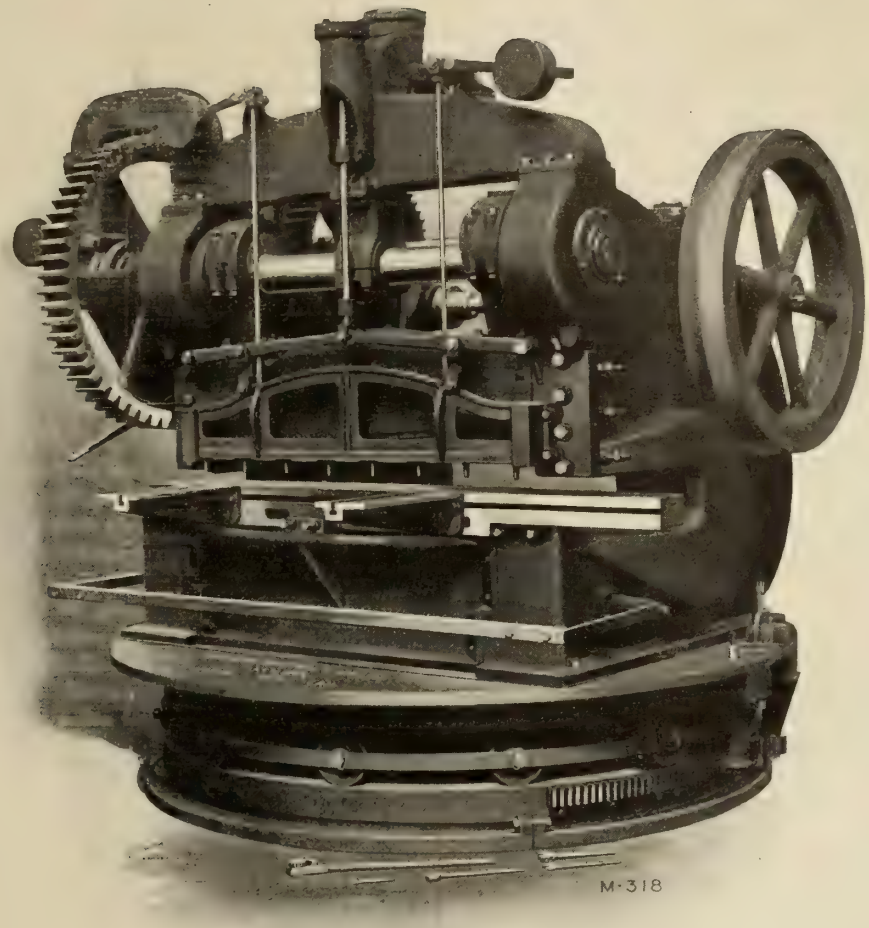
1. Tilting Ram. Ram bearing can be swung to an angle from vertical for cutting die clearances and similar work.

2. Swiveling Ram Head. Ram head can be swiveled through an entire circle for setting tool most advantageously. Work can be completed on all sides at one setting.

3. Improved Tool Post. Eliminates overhang of tool and usual projecting set screw.

4. Convenient Ram Control. Ram can be started or stopped, independent of main drive by lever on right side of upright.

5. Vertical Construction. Tool pressure holds work and table on base, where all cutting strains are absorbed, assuring greater and continued accuracy.



6. Quick Action Feed. Takes place when tool is entirely clear of work. Tool will enter work at a scratched line.

Write for illustrated Circular "Vertical Shaper."

Accuracy
Accuracy
Accuracy!

Trade Mark

Our trade mark, the High-Efficiency sign, is a guarantee of Accuracy.

Accuracy is the slogan of our plant. It is the first and the last requisite and covers every intervening operation.

Every worker in our employ is impressed with the necessity for accuracy and continuous supervision aids in securing it.

"Detroit" Twist Drills

are accurate to the one two-thousandth part of an inch; they run perfectly true from tip to shank and remove the greatest possible amount of metal at every turn.

A good stiff test in your plant is worth more than pages of testimony. And it won't cost you a cent. Why not make it? Your dealer should carry them.

Two minutes of your time and a postal will bring you Catalogue "R." Write to-day.

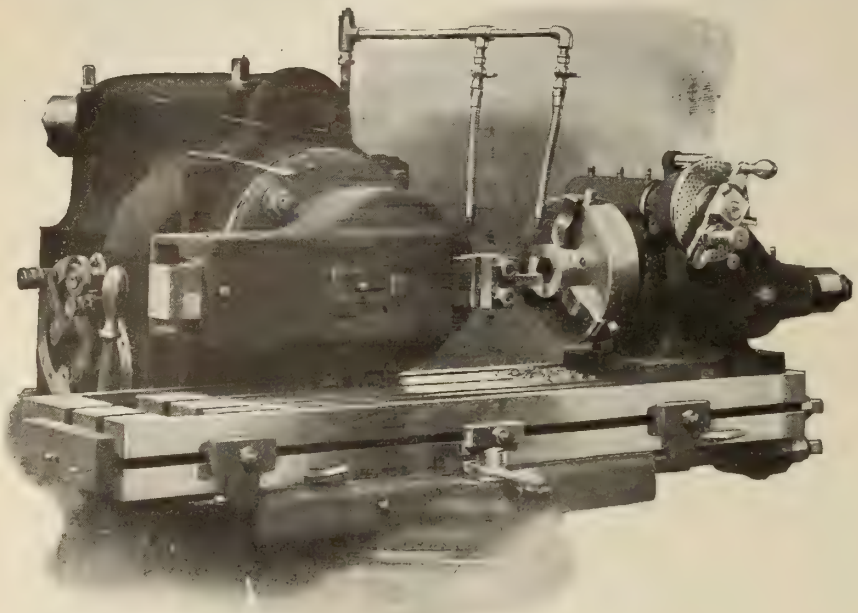
Centrifugal Force

and

Rim Speeds in Belt Pulleys



We are often asked the question "Is my speed too fast for a wood pulley?" showing clearly that many power users are still not familiar with just what it is that limits the speed at which Pulleys may be run with safety, and as to what kind of Pulley may be run faster than another kind, and the reason. We issue a little book entitled "Centrifugal Force," and its application to Pulleys, which we will mail to any power user on receipt of request.

We make Pulleys for all purposes in any size up to 20 feet diam., either Iron, Iron Centre Wood Rim or all Wood – and guarantee results.

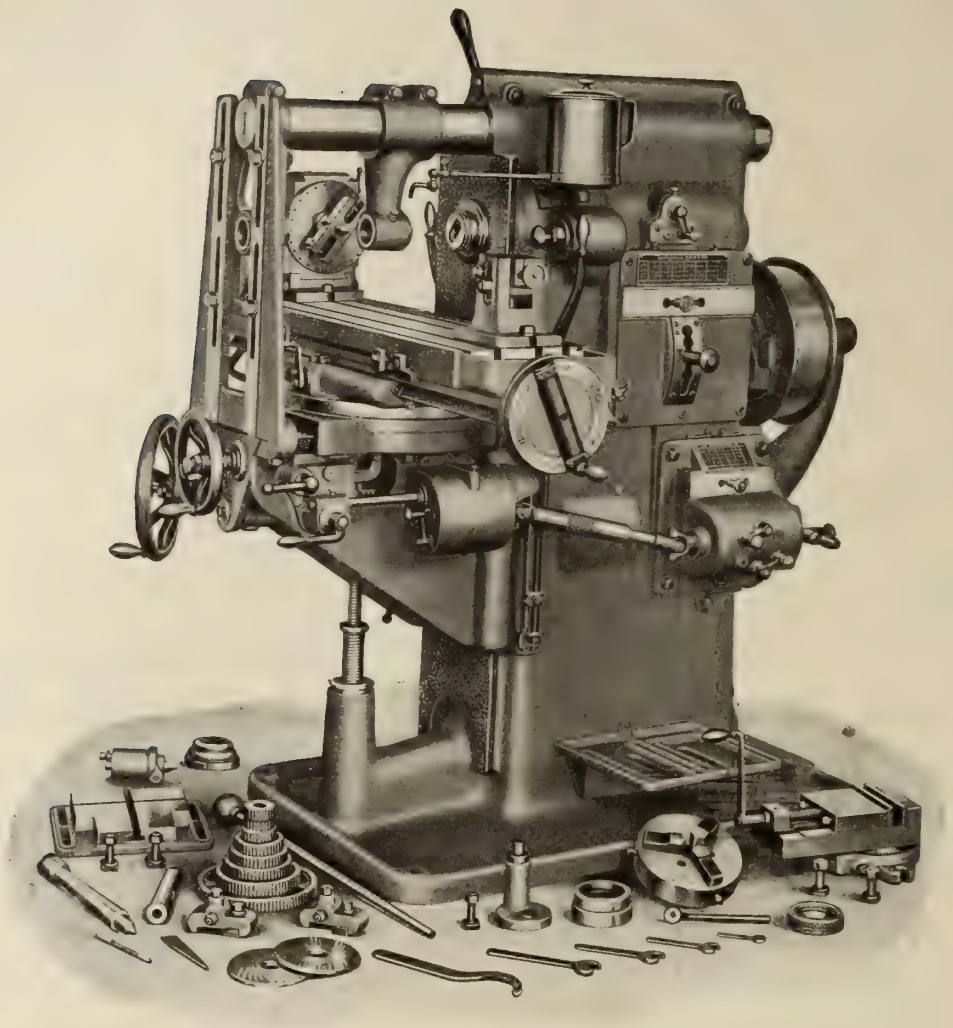
for Chisels, Cold Sets, Mining and general use.

"DOUBLE CONQUEROR"
suitable for Punches, Taps, Dies, Snaps, Shear Blades, etc.

"CONQUEROR"
High-Speed Steel in Rounds, Squares, Flats, also Profile Sections.

Our Prices will interest you.

The best and cheapest Steel and Drills on the market.



Made from our profile Section H, illustrated above, which is rolled hot to the same shape as milled Drills—no milling required.

Our new High Speed Steel **"Invincible"** Brand is better than any other High Speed Steel and will cost you less money.

No. 3A Universal Milling Machine

The Constant Speed Drive Enables You to Pull Heavy Cuts

The constant speed drive type of milling machine was originated at the shops of the Brown & Sharpe Mfg. Co., and placed upon the market by them. The fundamental principle of this type of machine is a single pulley or motor running at a constant speed, from which develop features that are distinctly advantageous in modern milling machine practice.

Brown and Sharpe

on a Milling Machine is just as much of a guarantee to you as the name "Sterling" on silver. You can depend upon a B. & S. Machine to accomplish what is claimed for it. A glance at the above illustration will show the lines and proportions of the machine as a whole, the heavy and massive frame, the large and rigid base, the vertical depth of table, saddle and knee, the rigid arm brace and arbor support, and the accessibility of all hand wheels and levers for controlling the various movements.

Any standard constant speed motor can be employed on this machine. The drive is direct from the countershaft to the machine driving pulley, which is of large diameter and runs at a constant speed.

Capacity of this machine is, longitudinal feed, 30 in.; transverse feed, 10 in.; vertical feed, 19 in.; all feeds automatic.

Write to our nearest branch for special circular containing full description and specifications of the B. & S. No. 3 Universal Milling Machine.

PRESENT HARBOR, ST. JOHN, N.B., FROM EAST SIDE

Industrial Development of the Maritime Provinces

By J. B. Dever

When we stop to consider the mineral wealth of New Brunswick and Nova Scotia, and take account of their location relative to harbors and ports for the export and import of the product of mill and factory, there is a natural disposition to assume that a higher degree of achievement in industrial enterprise should have been theirs in the past. Be that as it may, the record of progress and development shown in this article, indicates forcibly a realization, now, of possibilities to be grasped.

A NEW era has dawned in the industrial development of the Maritime Provinces of Canada. It is an era of progress and prosperity, and the situation has not been confined to one centre alone in the rapid strides onward, but is most pleasingly general. There is a changed feeling among the people—a spirit of optimism prevails, and after a visit to the scenes of various activities, it is not difficult to find the motive, for industrial expansion, agricultural progress, financial enterprise, transportation extensions, government and private developments and other important issues are all prime factors in contributing to the healthy and rapid growth. St. John, Halifax, Moncton, Amherst, Sydney, New Glasgow, Charlottetown, are each experiencing the same lively onward movement, but the strongest features in the underlying reasons for the optimism of the people are the new industries coming to St. John together with the government developments, the fact that the government is providing for the establishment of more material expansion at Halifax, and the knowledge that new industries are being created in the other centres of the provinces as well. The outstanding harbingers of future possibilities are the port developments of the two leading cities, St. John and Halifax.

Without prolonging this article to too great a length, it would be impossible to describe the various activities in the industrial world in the leading maritime centres. It would require another or more chapters to tell appropriately of what is going on in the way of new industrial projects being established, but in this article the endeavor will be to present a fleety sketch of what is transpiring in the Atlantic provinces to create the re-awakening which has occurred, and to permit of this section being known in trade and commerce circles, collectively speaking, as "The Busy East."

St. John, N.B. Harbor and Docks.

In St. John the change which has taken place recently, is quite remarkable. It practically began when the news became definite that the government would make at Courtenay Bay a new harbor in addition to the magnificent, all-the-year-open one, which has been the envy of other large cities for many years. The Grand Trunk Pacific purchased a site for terminals on what was then but barren lands, and closely following this came the announcement that The Norton Griffiths Co., Ltd., were to build a dry-dock, breakwater, and wharves, and also to dredge a harbor sufficient for deep-sea steamers. One of the chief officials of this latter company has made the cheerful announcement, based on practical knowledge and experience, that the city affords a splendid site for a steel plant. The work of the Norton Griffiths Co. is being proceeded with in a manner never expected. They are living up to their name as progressive contractors, and the stupendous task awarded them, calling for the expenditure of eleven and a half millions of dollars is going along in most commendable style, although it will take fully five years for its completion. W. Burton Stewart, general manager of the big English concern has announced that he will use his every endeavor to bring to St. John a steel and iron industry, and it is currently whispered that the Drummonds are interested in the movement as well. A short time ago, one of that illustrious name in the history of steel and iron expansion in Canada, was in St. John and had a conference with the mayor and commissioners, and it was freely stated after the meeting, which was private, that the matter under discussion was the projected establishment of such an industry. It is now said that the greater bulk of capital for the scheme has been subscribed.

The Canadian Pacific Railway, purchasing further land at west St. John, has begun the erecting of a million bushel elevator in addition to the other two now in the city. The J. D. Metcalfe Co. are working upon this contract and the work is being well pushed along. The T. S. Simms Co. are moving from their old brush factory in Union street to one decidedly more up-to-date in Lancaster which is now practically completed, the construction having been attended to by the Aberthaw Construction Co. The machinery for this great plant, which will have a much greater capacity than the former building, is being installed, and it is superior to that in many English broom factories in some of the large centers.

The Canada Brush Co. was organized early in the year and was meeting with distinct success in their output of stock until fire devastated their factory, and it looked for a time as though the city

might be deprived of what was a most promising industrial plant. Plans are now under way, however, whereby the company will proceed with even greater expansion, and they are finding all they can do in temporary quarters to fill the orders which are coming their way. The Maritime Car Co., another new concern, have wrought wonders at Coldbrook, having constructed a suite of fine buildings for the construction of automobiles, trucks, etc., and this is another industry which is expected to prove a distinct boon to St. John and the locality effected. It is thought that they will be shipping cars early in the spring. The firm of T. McAvity & Sons have found business so satisfactory that their present quarters are becoming too small for them, large even though they be, and they are

BEACON LIGHT AT HARBOR ENTRANCE, ST. JOHN, N.B.

only awaiting for a convenient site about the city to assemble all their plant in one place, giving employment in their brass finishing, moulding, and machine shop to nearly one thousand hands.

There has also been organized the Atlantic Sugar Refineries, Limited, with bright promises, and F. H. Anson, general manager of this concern, only recently deposited with the city the sum of $100,000 as a guarantee of good faith that the construction of one of the most modern sugar refineries in the world will be commenced, the buildings for which, with the necessary equipment will aggregate about $300,000. J. C. Burton, of Vancouver, B. C. was in St. John early in December, and was so favorably impressed with its opportunities for industrial enterprise, that he decided to open a branch of the firm with which he is connected, namely, the A. J. Burton Saw Co. They have another plant in Ottawa and their main plant is in Vancouver. They will also establish a branch at Oxford, N. S.

The climatic conditions of St. John are particularly favorable to textile industries. The capacity of the York and Cornwall cotton mills is to be increased and employment given to more people. This work is to be proceeded with immediately. Although the plant of the John E. Wilson Machine works was destroyed by fire some months ago, it is the intention to rebuild, and the matter is now receiving the earnest consideration of those connected therewith. With industrial and manufacturing establishments of long years' standing in St. John, and those which have been in existence from only recent date, the past year has been one of remarkable activity and prosperity. There is a wider market opening for products, and these are finding their way to the most remote corners of the continent. With the birth of the New Year some firms are even now planning still further expansion and the installation of more modern equipment in their shops.

Moncton, N. B.

St. John is not alone in the enjoyment of prosperity. Moncton, for instance has been booming along with encouraging strides, with the various manufacturing concerns experiencing a healthy condition of affairs. The discovery of natural gas has proven a great blessing, and the majority of the industrial and business houses are finding it advantageous and cheap to use. Natural gas and electric power properties are to be developed on a larger scale than formerly, and a prosperous future is predicted in this regard. There is every reason to believe that within a shorter time than people may think, there will be a pipe line from Moncton to St. John carrying natural gas. When this is accomplished, as it undoubtedly will be, judging from the interest displayed in the project, it will create a still livelier impetus in the growth of both places

Moncton's industrial concerns have had a good year, and are looking forward with bright hopes to the future. A new line of railway has been opened through fertile districts from that city to Edmonton, and more than ever is the name of "the railway city of the Maritime Provinces" deservingly applied to Moncton. Among the new projects being considered is the possibility of an English concern starting an automobile factory with a capital of $600,000, and the erection of a new woollen mill. There is also the organization of the "Provincial Clay Products" with a capital of $200,000, to manufacture drain pipe and other materials from an excellent bed of clay discovered adjacent to the city.

Chamcook N.B.

There is a new town on the map of New Brunswick. It has made its appearance within the past year, and now has quite a promising population. The name of the town is Chamcook and it is located in Charlotte county. Its presence has been made possible by the erection by the Canadian Sardine Co., of a splendid new factory there, and like magic, the buildings of the factory, dwelling houses, stores, etc. have sprung up. In all there are about five or six hundred people in Chamcook now, and this is most cheerful, considering that it was but a stretch of barren seashore only a few months ago.

Grand Falls, N.B.

The possibility of harnessing the enormous flow of water at Grand Falls, N.B., has long been a matter of discussion and interest with capitalists, but it now seems as though the project were assuming more definite proportions, as though it had developed something more than talk. A company has been organized in which Sir William Van Horne and others are interested, and a settlement of claims between it and a rival concern, each aiming at possession of similar power rights, will probably result in the successful harnessing of the water power. Premier Fleming gave it as his opinion some time ago that within three years there would be pulp and paper mills at these falls and there is now strong talk of a saw mill and pulp mill being erected by the company to which reference has been made. Bathurst is another place at which it is said there is reason to expect a harnessing of water power for similar purposes.

Fredericton, N.B.

Fredericton, the capital of New Brunswick, is not being neglected in its share of industrial prosperity, and the same may be said of the concerns at Woodstock. In the capital, within the past

year, there has been much expansion in the factories of the shoe companies, and two new packing factories have been erected. The cotton mill at St. Mary's is to be further enlarged and this is generally taken as a most forcible sign of prosperity. Campbellton, rebuilt on broader lines, has arisen from its ashes, and there is little now left to remind one that only a few years ago the whole town was devastated by flames.

Amherst, N.S.

Passing from New Brunswick to the sister province of Nova Scotia, the city of Amherst naturally suggests itself as a centre wherein manufacturing and industrial conditions had attained a high degree of success, and this is plainly evident from a visit to this hustling township. The Rhodes, Curry Co. have been greeted with encouragement to a great extent, and the Malleable Iron Works have found things so promising that they decided it was time for further expansion of their plant. Christie Bros. & Co., have also added to their plant. The Nova Scotia Carriage Co., manufacturing carriages and automobiles, are now established in Amherst and find themselves with plenty of good business at hand.

New Glasgow, N.S.

New Glasgow is naturally located for budding into a big industrial city. It is in the centre of a thriving community, beng united by electric train service, with the bustling mining towns of Westville and Stellarton, and within a short radius of its centre reside fully 20,000 people. The erection of the Eastern Car Company's shops and works has proven a wonderful boon for the city, and will probably mean the introduction of new industrial establishments. The McNeills and the Brown Machine Co., both of New Glasgow attended to the contract work, which was enormous. Many of the men behind this concern are members of the Nova Scotia Steel & Coal Co., which has met with success at New Glasgow, and they have organized for the construction of steel freight cars, with a capital of $2,500,000. The other industries are also prospering and have had a splendid year. One of the recent acquisitions to the industrial life of Truro is the formation of the Canada Cap Co., which will afford employment to quite a number of hands.

Sydney and Glace Bay.

Sydney and Glace Bay would scarcely be recognizable to-day as the same centres they were even a couple of short years ago. The mining, steel and coal industries there, are in a flourishing state, enlarging their output every year, and making valuable and important additions to their plant and equipment. The fertilizer works at Sydney are among the more recent of those which have found the need of enlargement. This new concern has met with much success in the manufacture of mixed fertilizer, and among the plans for the expansion is a provision for the erection of a large factory.

Halifax, N.S.

Evidences of industrial progress in Halifax are not difficult to find. They are plainly visible in the encouraging state in which the industries of the city are found. The expenditure of $20,000,000 by the government on terminal facilities and in the construction of wharves to cope with the increased steamship traffic is an important event, and is evidence of the valuable position occupied by the city in this regard from a federal, or really national standpoint. The increasing of the size of the dry dock to provide greater accommodation will eat up another million dollars and the same may be said concerning the immigration facilities. It is also currently reported in the city that another million will be expended on improving the fortifications there. Undismayed by the fact that they were heavy losers in the fire which swept their plant at Woodside last February, the Acadia Sugar Refining Co. are rebuilding at a cost of about $1,200,000 on the same site, the contract being given to S. M. Brookfield, Ltd. The company has every reason to believe in the future, and was doing a splendid business when the fire devastated their holdings. The new buildingings and equipment will be much superior to the old.

Many of the larger manufacturing firms are finding it necessary to enlarge plants for the purpose of coping with the rush of business. Two of them alone, with this object in view, are making additions and changes which will require an outlay of $100,000. The city council has decided upon the building of an incinerating plant which will cost in the vicinity of $50,000. The tram companies finding business rapidly growing, have spent $100,000 in extending their service and double-tracking certain sections.

These are but a few of the many important factors in the commercial life of Halifax, and at a rough estimate it is figured that nearly $30,000,000 has been spent during the past year or will be in the near future in different projects, enlarging the scope of some, creating others, and in general expansion along the lines indicated, or in building operations. Haligonians as a rule do not shout much, but these figures stand for something of this nature. The government expenditures on the erection of about a mile and a half of docks will naturally bring other industries and create a new situation with regard to civic progress. It will mean greater activities in various ways, and it is not at all unlikely that within the course of a few years there will be established large ship-building works.

General.

After all that has been said, is it not reasonable to say that Canada's East has come into its own? Is it not apparent—the reason for the feelings of the people of the Maritime Provinces being so strongly optimistic of the future? On every hand are evidences of growth, and it is a healthy and continued growth which will not die in a given time. It has come to stay and will expand even to greater dimensions within the next five or ten years, until such cities as St. John, Halifax, Moncton, New Glasgow, Sydney, Fredericton and others are the centres of a wealth of progressive industry, metropolitan in their composition, and advancing steadily to the foremost ranks amongst the leading cities not only of Canada but of the long line of territory touching upon the broad Atlantic. More industries are coming, that is certain. The boom which is now being experienced in St. John and Halifax more particularly than in other cities, is certain to extend its influence over a greater stretch of country, until the surrounding suburbs are embraced within the confines of those two great seaports, and the advent of the next decade will see them prominently noted each as a leading metropolis of Canada, taking rank with the foremost on the map.

WIRE AND NAIL PLANT INCREASE.

PRESIDENT Plummer, of the Dominion Steel Corporation, reports that additional machinery to increase the capacity of their wire and nail plants, which have recently been doing double turns, has been ordered. This will give at once an output of over 2,000 kegs daily, and ultimately provide an outlet for the whole of the product of the wire rod mills. The company is arranging for a distributing centre at the head of the lakes, where they may, in addition, put in a small nail mill to facilitate their North-West business. It is the intention, however, to concentrate the manufacturing business as much as possible at Sydney.

F. John Bell, formerly general manager of the British Canadian Power Co., Cobalt, Ont., has been appointed general manager of the Canada Wire & Cable Co., Toronto.

STEAM-HYDRAULIC FORGING PRESSES.

MAKERS and users of heavy forgings are generally ready to concede that press work is better than hammer work, unless the hammer be made of unwieldy proportions, and, wherever we turn, we find the latter being replaced by presses. The reasons are well

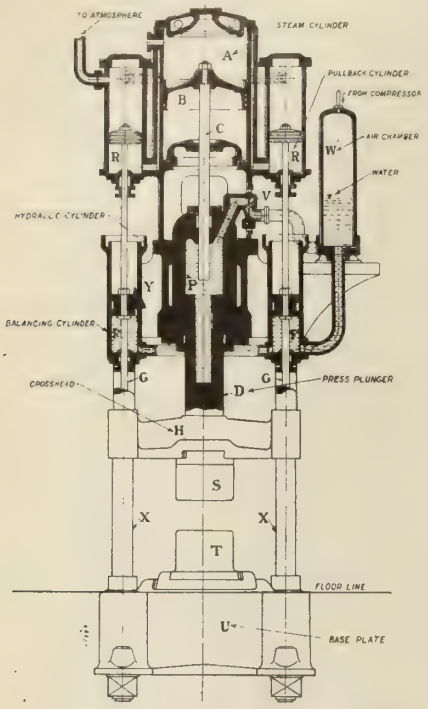

FIG. 2. SECTIONAL DRAWING OF MESTA-HANIEL & LUEG PRESS.

known. Hammers, unless excessively heavy, work on the outside of the piece and leave the inside spongy, whereas, the slow pressure of the press treats inside and outside alike. Furthermore, heavy hammers require large and costly foundations, and even then their efficiency is far from perfect, because a large portion of the energy of the blow is dissipated in vibrations of foundation and soil.

While hydraulic accumulator presses have been in use on this continent for several decades, the steam-hydraulic or direct acting intensifier press is of rather recent origin and has been developed in Europe. Its success on the other side of the Atlantic has caused several American firms to take up its manufacture, and the Mesta Machine Co., of Pittsburgh, have introduced a design which, in accessibility and straightness of force action, equals or even surpasses the steam hammer. The press in question was originated by the firm of Haniel & Lueg, of Dusseldorf, Germany, and the exclusive right for building in the United States and Canada was acquired, two years ago, by the Mesta Machine Company, together with a large amount of engineering and manufacturing information relative thereto.

Fig. 1 shows two of the presses built by the Mesta Machine Co. for general forging purposes. The operating lever for the large press is shown at the left of the picture, and it will be noticed that it is accessible from all sides for the use of shear tools, die holders, etc. Fig. 2 shows a front elevation with sectional view of the cylinders. The press consists of a heavy base (u), four columns (x), and the stationary cross-head (y), which contains hydraulic cylinder (p) and hydraulic balancing cylinders (f). The pistons of the balancing cylinders (f) are connected to the movable cross-head (h) by the piston rods (g). The pistons of the steam cylinders (r) are connected to the extension of piston rods (g). The air chamber (w) is partly filled with water and is connected to hydraulic cylinder (p), with check valve (v) in the connecting pipe. The bal-

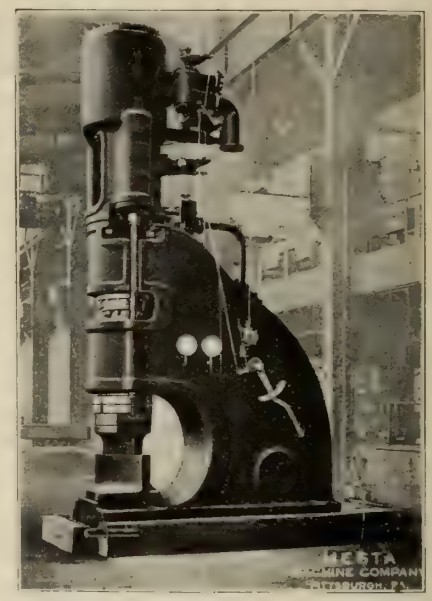

FIG. 3. MESTA-HANIEL & LUEG PRESS, BUILT FOR BROOKLYN NAVY YARDS.

ancing cylinders (f) are connected directly to the air chamber. The single-acting steam cylinder is seen at (a), while (t) and (s) are the top and bottom dies.

Hydraulic cylinder (p) balancing cylinders (f) and about one-third of air chamber (w) are filled with water. The air chamber is then pumped up to a pressure of about 100 pounds, which is sufficient to move piston rod (e) and piston

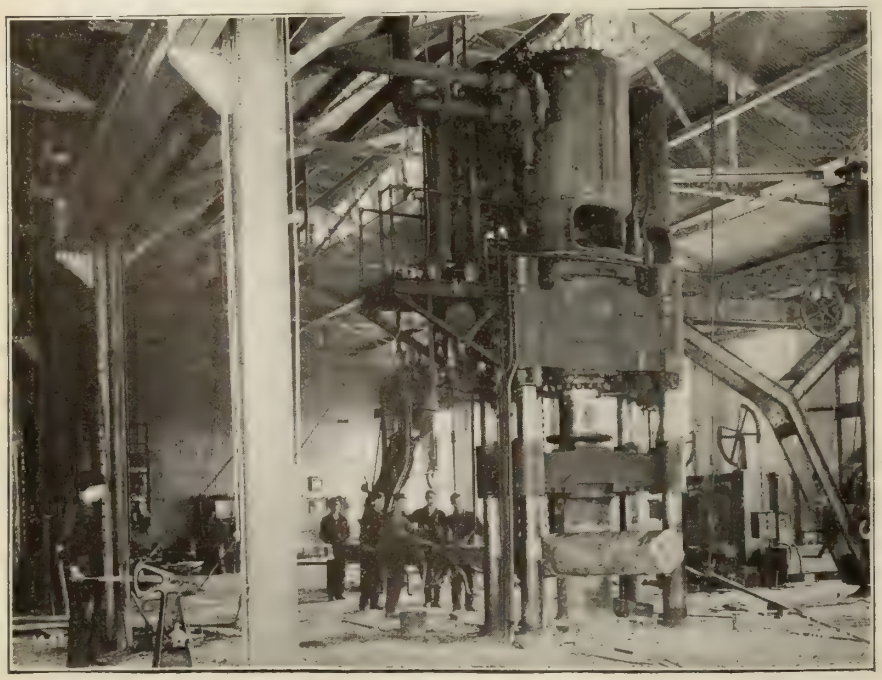

FIG. 1. 800 TON MESTA-HANIEL & LUEG PRESS AT WORK IN FORGE SHOP.

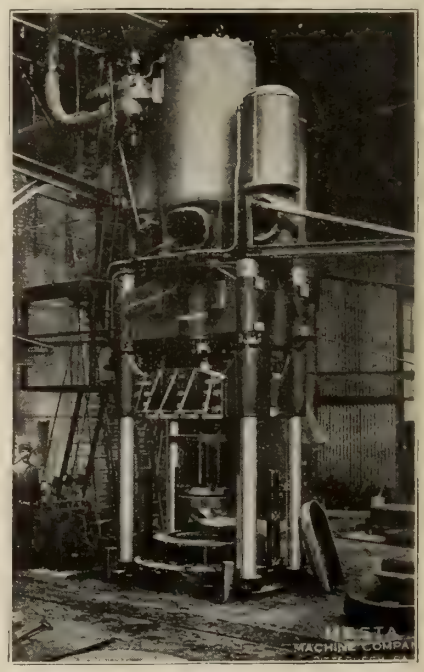

FIG. 4. MESTA-HANIEL & LUEG BENDING PRESS FOR BOILER HEADS AND FLANGING WORK.

(b) to the top of steam cylinder (a), when there is no pressure in the latter. The pressure on plunger (d) is always balanced, as the area of the two cylinders (f) is equal to the area of cylinder (p). By admitting steam to cylinders (r) the cross-head (h) which contains die (s) can be moved upward to any point by lifting check valve (v) and allowing water from cylinder (p) to flow into air chamber (w). When die (s) is at the proper height, check valve (v) is closed, and the press is then ready to take the piece to be forged between the dies (s) and (t). By admitting steam to cylinder (a), piston rod (c) is forced into cylinder (p), which gives the necessary pressure to do the forging. As soon as the steam is exhausted from cylinder (a), piston (b) and cross-head (h) automatically move their positions ready for the next stroke.

Press Features.

The all around accessibility of the press and the small requirement of floor

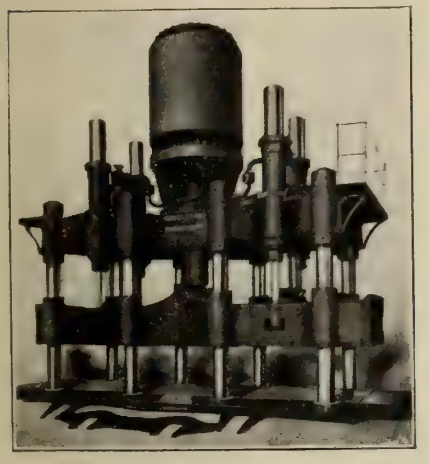

FIG. 5. MESTA-HANIEL & LUEG BENDING PRESS FOR CAR FRAMES.

space is coupled with a slightly greater requirement for head room. The word "slightly" is used on purpose, because on presses which place the steam intensifier on the floor, the pull back and balancing cylinders take up considerable head room which is only very little increased in the Mesta press by the central intensifier. A glance at figures 1 and 2 proves the correctness of this contention. The accessibility is also exemplified by Fig. 3, which represents a press built for the Brooklyn Navy Yard. It shows the press and intensifier complete, the whole in outward appearance, resembling a steam hammer, without its objectionable features, namely, vibration and costly foundations. The press-forces are self-contained, so that it can sit on beams if necessary. Fig. 3 also shows a linkage system (above the frame) for the purpose of making the motion of the upper press die follow the motion of the operator's hand. This linkage offers the additional advantage that it makes use of whatever inertia there may be in the moving parts for obtaining steam economy by expansion.

It has long been realized that the hammer is out of the race in flanging processes, and for this purpose, presses are in general use. Here the survival of the fittest and the trend toward simplicity and direct action open a wide field to the steam hydraulic press. Fig. 4 shows a flanging press (Mesta-Haniel & Lueg system) with steam and pull back cylinders, and Fig. 5 shows a steam hydraulic press of the Mesta-Haniel & Lueg type for flanging car frames. This type of press can be adapted to many other uses.

COAL VERSUS OIL.

IN the course of his annual memorandum, Mr. C. E. Stromeyer, the chief engineer to the Manchester Steam Users' Association, gives some notes on the use of oil as fuel, as well as on the question of oil and gas in internal-combustion engines.

He remarks that it is difficult to make a comparison of prices, for according to quality and locality the value of coal varies from, say, less than $2.50 for slack near the colliery to well over $5.00 for good coal in towns.

Advantages of Oil Firing.

Two very important advantages of oil firing are the ease with which it can be regulated, and the absence of ashes and clinker; on the other hand, oil must be burnt in brick-lined combustion chambers, which suffer severely from the intense heat and have to be frequently repaired and renewed. If these brick chambers are built into the furnace flues, they have to be pulled out annually in compliance with the Factory and Workshops Act.

During the recent coal strike in England, many steam users fitted sprayers to their furnaces, which delivered the oil upon the bed of coal on the grate. Generally the results were as satisfactory as could be expected, but there were quite a number of gas explosions in the flues. These were due to the escape of unburnt oil which had become vaporized in the warm flues and was there mixed with air; any spark which might stray to a remote corner of the flue where this explosive mixture had formed would ignite it.

Internal-Combustion Engines.

Roughly stated, a first-class modern steam engine utilizes about 12 per cent. of the available heat in the coal, resulting in, say 1.6 lb. to 1.7 lb. of fuel per b.h.p. per hour during a week's work of 55 hours. If the boilers are to be fired by producer gas, for which purpose slack and dust can be used, then each b.h.p. will require about 2 lb. to 2.2 lb. of coal. Internally-fired gas and oil engines are approximately twice as efficient as steam engines, which means that they utilize about 25 per cent. of the available heat.

Crude oil being 37 per cent. better than good ordinary coal, oil engines should use only about three-eighths of the quantities of coal mentioned above, say about 0.6 lb. per B.h.p. Then, however, as there are no boiler radiation losses over night, a material saving results, and the oil consumption per week of 55 hours may be about 0.5 lb. per B.h.p. Petrol and similar internal-combustion engines would require about 0.4 lb. per B.h.p. Gas engines have also about the same efficiency as oil engines; but as there is a loss of about 20 per cent. in the producers, if these work day and night, and another loss of quite 10 per cent. if they have to stand idle overnight, the efficiency of gas engines is only about 40 per cent. better than that of first-class steam engines.

Fuel Cost Relationship.

The following table shows the relationship of prices of the various fuels, each column giving those prices at which equal economy would be achieved if any of the power processes mentioned are used:—

Crude oil, per ton	$9.00	$10.00	$11.00	$12.50	$14.00	$15.00
Crude oil, per gal.	3.5c	4c	4.5c	5c	5.5c	6c
Good coal, per ton	6.50	7.50	8.50	9.50	10.25	11.25

Thus, at present, it would cost just about as much to use a Diesel engine, as a steam engine, but in remote districts the Diesel engine would probably show to advantage. Petrol engines are, of course out of the question from an economical point of view, for the present price of petrol is quite three times as high as that mentioned above. It ought to be profitable to work internal-combustion gas engines, for although gas producers can be fed with very cheap fuel, the above list shows a profit even when paying 15 per cent. more than for steam coal. The reason why these engines are not used as much as might be expected is that they are not self-contained like oil engines, but are hampered with costly and troublesome gas producers. In order to reduce this nuisance, gas might be produced at central stations and supplied through pipes to gas engines at the works; but that means that factories would have to cluster themselves together, which is against the present tendency, and way-leaves for large pipes would have to be obtained.

INCREASED LOCOMOTIVE EFFICIENCY FROM CHEMICALLY TREATED WATER.

THE Committee Report of the Traveling Engineers' Association states that the use of soda ash in the tank in the proportion of about 1 pound per 1,000 gallons, the use of caustic soda in smaller proportions, and also the water-treating plants, have all met with success so far as scale formation is concerned. In connection with the graphite, luminator and crude oil treatments, the committee has no information of any beneficial results having been obtained.

One complete report was submitted in reply to the request for the cost of treating feed-water. This was from the Santa Fe. The accompanying table gives the average costs for the different divisions:

The conclusions from the answers to the questions in connection with the mileage of flues and fire-boxes before and after treatment of feed-water show that an increase in mileage of from 78 per cent. to 150 per cent. is being obtained where the water is handled in treating plants. Equally good results followed the use of anti-scale chemicals in the tenders. The following is the report of the Santa Fe on this feature:—

COST OF TREATING WATER ON THE SANTA FE.

Santa Fe Report.

"Since the adoption of our water-treating system the mileage of fire-boxes and flues has been doubled and trebled. One of the best examples is the Los Angeles division. In the latter part of 1905, eight large Pacific type oil-burning, passenger locomotives went in service on that division, and up to December, 1907, each of these locomotives had received a new fire box, six of them had received three sets of flues, and the other two, two sets; the average mileage of all fire boxes was 66,064, the lowest 62,452, and the highest 81,608. The average mileage per set of flues during this period was 25,167. There are mountain grades on which helpers are used. The work performed by these engines is heavy fast passenger service, and a very large part of the division is 1 per cent. grade. Shortly after these engines received new fire boxes, or in the latter part of 1907 and the beginning of 1908, a number of water-treating plants were installed, and three other plants were installed in 1910, consequently some of the locomotives made considerable mileage with the second fire-box before the installation of the water-treating plants was completed. There are no serious defects in these boxes as yet, and they have up to January of this year given an average service of 168,589 miles, and are still going; the flues have given an average service of over 44,000 miles, an increase in flue mileage of 78½ per cent.

Treatment Beneficial.

"We use treated water to prevent incrustration, and give credit for the prevention of incrustration and improvement in the performance of our fire-boxes and flues to the system of treating water. We use an anti-foaming treatment to prevent foaming, both with our treated water and in territories where the water is not treated. This does the work very satisfactorily, eliminating all of the troubles due to a foaming boiler, reducing the cost of fuel and lubrication, and enabling us to handle tonnage that it would be impossible to handle otherwise. In territories where the water is not bad enough to warrant the installation of treating plants, but does give trouble with foaming, we find that anti-foaming preparations have a favorable effect in preventing incrustation as well. It is but just and fair to a water treatment that counteracts or prevents foaming, to give it credit for adding to the life of the fire-box and flues, on the theory that when it prevents foaming it keeps the water in a more dense condition, so that it absorbs more readily the heat that is passing through them, and by so doing prevents their overheating and consequent damage.

General Conclusions.

Other conclusions reached by the committee were that treated water increases the tendency to foam; that anti-foaming chemicals are successful; that treated water does not increase the mileage between washouts; that the efficiency of the locomotive is increased by the use of treated water, especially if used in connection with an anti-foaming treatment; that the increased foaming of waters treated for scale increases the cost of maintenance of the locomotive; that blow-off cocks should be freely applied and used, that their operation should be convenient and that the frequent use of blow-off cocks for short intervals is better than longer openings at long intervals. The committee stated that soda ash is beneficial in waters where the encrusting solids are heavy and the alkali salts light.

OPENING OF THE TRANSCONA SHOPS.

ALTHOUGH the question of whether the Transcona shops do or do not form an integral part of the National Transcontinental Railway is still under arbitration, a temporary agreement was recently come to between the Government and the Grand Trunk Pacific Railway, by which the latter commenced operation of the locomotive shops on Jan. 20th. Mr. G. W. Robb is Master Mechanic, G. T. P. R., has been busily engaged in organizing a working force, the men being drafted from Rivers, Man., and other divisional points. It will, of course, take some little time to gather a full mechanical staff, but the G.T.P. hope to be able to soon get together some 400 or 500 men. Raw material necessary for locomotive repairs is being rushed to Transcona as rapidly as possible and work on a small scale has already commenced.

The opening of the shops has given quite an impetus to the town of Transcona, which had long been anxiously awaiting the event.

Some Principles of Successful Storekeeping

By J. Herriot**

The writer, who is in charge of the storekeeping department of the largest general engineering plant in this country, here deals in an interesting manner with the fundamental principles necessary to be observed for keeping the various shops well supplied, without having on hand an excessive stock.

THE stores department is one of the most important branches of any up-to-date plant, and unless it is well equipped, and the stock kept up to requirements, the other departments must necessarily suffer. In the first place, the department should be well housed with good buildings containing sufficient capacity for proper storage of raw and finished material necessary to the plant concerned, otherwise the department is handicapped by goods being scattered around, where they are overlooked and not properly accounted for. Bins should be arranged so that each class of article is together, so that the storeman may be able to locate same quickly, and not delay workmen at the wicket. There is now on the market a line of bins for stores purposes, made of steel and on the same principle as the sectional bookcases with which we are all so well acquainted. These are built up in separate units, and are so arranged that the compartments can be altered in size as requirements may demand. I had the pleasure of visiting the store-room of one of the large plants located in Toronto which was equipped with this outfit, and it certainly left nothing to be desired as regards efficiency and neatness. Bar iron, steel, pipe and tubing, and other heavy material, which in many cases are stored outside, should have proper racks, and a covering of some kind as a protection from the weather. Stores buildings should be located as centrally as circumstances will permit, so as to be easy of access from all parts of the plant. Iron and steel bar should be stored near the smith shop; other heavy material is generally unloaded as near the point of manufacture as possible, in order to facilitate handling when required to be put into production.

Shop Requisitions.

The amount of stock kept on hand is, of course, governed by the volume of business passing through the plant and orders are placed accordingly. All specifications emanating from the shop production department pass first into the stores department. These specifications detail every item which will be required in connection with the contract or sales order involved. They are checked with the stock on hand. Any material not in stock, is ordered at once for this special job and must be reserved for same.

Material used in maintenance of plant, or what is known as "shop expense," is also handled in the same manner, but special tools required are only ordered or carried by authority of the general superintendent. In all plants there is a certain class of both raw and finished material which enters into the manufacture of standard lines and which can be safely carried into stock, but of this a maximum and minimum figure should be fixed. Any extra demand for these lines should be immediately covered by requisition. This would include iron and steel, both round and flat, rivet steel, boiler and tank plate, pipe and pipe fittings, etc. Tool steel should not, in my opinion, be carried in any quantity, as the demand for this is governed by the shop practice and can be ordered as required. Some may object to this on the ground of delay to work, but as this steel can always be procured on short notice (that is, in standard sizes) this objection cannot be sustained.

Railroad and Factory Storekeeping Compared.

From my experience both on the railroad and in the factory, I would say that the handling of railway stores is much easier than the other. In a railway stores, practically only one line of business is to be looked after, either the repairs of locomotives, repairs of cars, maintenance of way or traffic department. The material carried is always standard to these lines, and there is not much variation. The consumption from month to month generally averages the same amount, so that the stock can be always arranged to suit. Any overstock for a certain class of engine can always be transferred to some other point where this class is also stationed, and vice versa.

In an engineering plant which embraces the manufacture of varied lines, say locomotives, steam shovels, pumps, bridges, etc., you will readily understand that you cannot do this so easily, and the storekeeper's life is not always a pleasant one when he fails to keep "production" supplied.

Stores Accounting.

With regard to the "system" necessary to the proper accounting of the stores department, no two persons or no two plants have the same system, or the same opinion as to how this should be done, but I will endeavor to give you an idea of the work required in order that supplies may be properly accounted for. All requisitions for material originate in the stores department, and after being approved by the head of the plant, pass to the purchasing department (although in some cases these two departments are combined), who are responsible for the placing of the orders on the market, and who notify the Stores on whom these orders are placed. A copy of the requisition goes to the "chaser" and another copy to the "receiving clerk" who are on the Stores staff. The chaser's duty is to keep in touch with the vendor and follow the order up so that delivery of goods may be made when required and production not delayed. He has to keep all records as to promises given, and reason of delays, etc., in fact should have notes on all material outstanding.

The receiving clerk receives all material which comes into the plant, checks same with his copy of the requisition, notes any differences in weights and quantities, and makes out receiving slips, which then pass to the inventory or stock clerks, and then to the accountant, where they are compared with vendor's invoice before being passed for payment. The receiving clerk also makes out all over, short, and bad order claims against the railroad or other carrier, also checks the freight bills, etc., amount of same being entered on his report, so that goods can be priced at invoice value, plus amount of freight charges, and customs duty, if any. The customs end is handled by another department, copy of entry being furnished the receiver for his record.

No goods of any description should be unloaded without the receivers being present, and this rule is a hard and fast one, as unless it is adhered to, errors and mistakes will creep in. This rule applies not only to goods delivered by city merchants, but also to car load lots. In this connection, car loads must be carefully watched so that no delay in unloading cars occur and "demurrage" bills pile up. All cars placed on sidings by the railroads are reported to the receiver who checks up his freight advice, customs papers, etc., and if same are all clear, then gives the order for unloading, also advising where material is to be placed.

The Stores Inventory or Stock Ledger.

Some prefer the card system and others the loose leaf ledger for the stores

*Abstract of a paper read before the Central Railway and Engineering Club, Toronto.

**General Storekeeper, Canada Foundry Co., Ltd., Toronto.

inventory, but this is a matter of choice, as practically the same results are obtained from either. These cards have headings showing name of article, location, etc., columns showing receipts with numbers of receiving slip, quantities, price, issues and balance. Cards should be filed alphabetically. Goods are entered from the receiving slips, prices are taken from invoices, after same have been checked in accountant's department. Issues are made from "material order slips," which will be explained later. In addition, a card is placed in each bin with goods showing receipts and issues, so that by looking at these cards it can be seen at a glance what quantity is on hand of that particular item. This card is posted by the stores helper when delivering goods on orders from shops. It is also the practice to have an inventory clerk, whose duty it is to check up stock, he being employed on this continually, same being then compared with cards, and adjustments made if necessary.

"Material Order Slip."

This is the order placed on stores by foreman or authorized employee for material required, and no article should be issued without this order. These orders show the "shop order number" or "expense number" to which the goods should be debited, the description and quantity of material required, also drawing or pattern numbers. They pass to the inventory clerks, who enter them on their records, price and transmit them to the accountant's office, where they are handled by the "costs" department. All material left over on any job should be at once returned to stores with a credit slip, showing the order number to which the same is credited. This is taken back into stores at value issued (if in good condition) or if same has been improved, the extra labor is added to value.

Handling Scrap.

The handling of scrap material is also in most cases done by the stores department, scrap iron, steel, steel and iron turnings and borings, copper, brass, rubber, rope, etc., being classified and stored at convenient points for loading, and when a sufficient quantity accumulates it is sold. Brass turnings from the brass finishing department are also disposed of in the same manner, or else remelted in the foundry.

There are certain materials used in all plants which cannot be kept directly under the eye of the storekeeper, and he has to depend on the other departments to give the necessary orders when using them. These embrace lumber, coal, coke, etc., and workmen seem to have the idea that because it is all company's material, they are at liberty to use same at their pleasure without putting through the proper account, which to their minds is "red tape." Men should have their minds disabused of this idea by careful instruction.

Qualifications of a Storekeeper.

Some of those present may remember a paper which was read before this club by Mr. Alfred Tory, General Storekeeper, G.T.R. System, London, Ont., in October, 1908. Among other interesting things he gave a list of the numerous qualifications required of a railway storekeeper, and as these are also applicable to the storekeeper of any large plant, I think the repetition will not be amiss:—

"A railroad storekeeper should be an integrate part, a cog in the wheel of the system by which he is employed.

"He must possess 'tenacity' and a faculty for concentration, etc.

"It is his duty to familiarize himself with all classes of material, and have a general knowledge of all classes of railroad material and be familiar with its composition and construction.

"It is his duty to supervise those under him to produce the best results.

"He must make himself thoroughly familiar with his base of supplies, etc.

"He must study the requirements of the territory depending upon his storekeeping for supplies.

"He must study the best interests of the company, using his best endeavors to prevent excessive and wasteful use of materials.

"He should keep in touch with the commercial world, to enable him to determine when and how to replace requisitions, so that the material may be furnished with as little delay as possible.

"He must inform himself by personal observation, concerning work under way or contemplated, and ascertain what material is likely to be wanted.

"It is his duty to keep in touch with his stock by personal observation, instilling into his subordinates the necessity of having ample supplies on hand at all times, to prevent delays. He must dispose of all obsolete material. Keep his stock standard to power and equipment, and avoid carrying dead stock.

He must systematize his store house in such a manner that material may be handled promptly and economically.

"It is his duty to instill into his subordinates the necessity of cleanliness—store houses, lumber yards, scrap bins—all should be models of neatness, etc.

"It is his duty to prevent the store house being made a loitering place by employees.

"He must see that store department material is unloaded promptly from cars to prevent loss of revenue by such cars being out of service.

"It is his duty to help all departments, at any and all times, in all possible ways, and do his best to promote the general welfare of the service."

"It is his duty to maintain the strictest discipline, with store employees, especially in regard to pilfering, etc."

"He must be ready at all times to listen to suggestions, which would improve the efficiency of the store house.

"It is his duty to economically order material. He must keep accurate record of all such, ordered and received, check and inspect same and protect his employers from cheap and inferior goods, etc.

"He must understand the nature of material, and store it so that it does not deteriorate.

"He must assume full control of all scrap and surplus material that may accumulate, etc.

"He must keep a book record of all material issued, etc.

"He should meet all officers and employees with that due respect that designates the true gentleman, and treat all employees with the same courtesy as if he was conducting a commercial business.

"He should inspect all sub-store houses at outlying points under his jurisdiction, etc.

"He should be subject to order of the general storekeeper only, and report direct to him in matters pertaining to stock, etc."

From this list you will see that a railroad storekeeper has not a bed of roses by any means. If, to be a successful storekeeper, it is necessary to have all the qualifications mentioned, I am afraid there are very few of us who will be able to come up to them.

THE REDCLIFF ROLLING MILLS & BOLT CO.

NORTHWESTERN Canada is to have a rolling mill. The Redcliff Rolling Mills & Bolt Co. is building a plant at Redcliff, Alberta. The products of the works will be bars, bands, angles, channels, bolts, nuts and rivets. The rolling mill equipment will comprise busheling furnaces, a muck mill and a 10-in. Belgian finishing train of rolls. A contract for the muck mill and 10-in. finishing mill has been placed with the United Engineering & Foundry Co., Pittsburgh. Orders for the engines have also been placed. The company is now in the market for a complete equipment of bolt, nut and washer-making machinery. This machinery will be purchased by the superintendent, Robert McCleary, Medicine Hat, Alberta.

L. E. Gehman, recently assistant efficiency engineer, Canadian General Electric Co., Peterboro, Ont., has accepted a similar position with the De Laval Steam Turbine Co., Trenton, N.J.

Grinding and Scraping Compared

By F. B. Jacobs.

FOR many generations scraping has been accepted as the only satisfactory method for producing straight or plane surfaces, but owing to the development of surface grinding machinery and grinding wheels during the last decade, the process of surface grinding has advanced to a position where it compares very favorably with other methods for producing approximate planes. To produce a plane surface by scraping calls for a skilled operator and true master planes to gauge the work by, while in surface grinding the selection of the proper wheel as regards grit, grade, and bond, together with the kind of abrasive used, is the most important factor, for no matter how well a machine may be designed and constructed its output is seriously handicapped when wheels selected at random are used. It is impossible to plane, mill, or scrape any surface in a satisfactory manner without tools and cutters made of the proper materials and in the correct way. Any engineer or machinist will admit this, then why should we expect to produce accurate work by the process of surface grinding without the correct wheels? This is readily understood when we consider that heating of the work causes errors due to expansion and contraction, these forces never working evenly in all parts of the piece being ground. Admitting this, it is evident that a cool cutting wheel will produce the best results, as it reduces the factor of heating to a minimum.

FIG. 1. GRINDING AND SCRAPING COMPARED.

Spot Grinding.

I have many times produced very accurate surfaces by the old and simple process of spot grinding, which is the oldest known form of surface grinding. This method is illustrated in Fig. 1 and consists of passing the work under the wheel by hand at various angles until the work is ground to a point where very slight sparking is visible. All that is required for this method of grinding is a reasonably plane surface to move the work on and a wheel of the proper kind, with an accurate spindle for driving it. The grooves shown in the illustration are a very good feature as they help to keep the surface free of dust.

In Fig. 2 is shown a jig base casting that was finished in this manner. This piece was first roughed out on the milling machine, one chip only being taken on a side. Then the feet were spot-ground enough to make them sit level when tested on a surface plate. Next the top was spot-ground, then another light chip taken over the feet. Tests on the surface plate showed good bearings, and on laying the piece face downwards and testing the feet with a height gauge, no variation could be noticed. The time consumed in grinding this piece was one hour, and when we compare this with the time that would be consumed in accurate milling or planing followed by scraping, the argument is decidedly in favor of grinding.

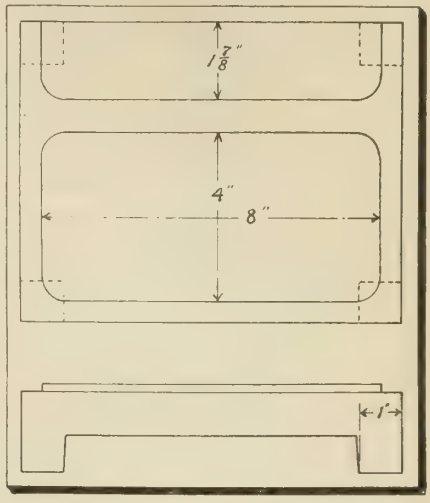

FIG. 2. GRINDING AND SCRAPING COMPARED.

Surface Grinding.

In Fig. 4 is illustrated an operation where plane surfaces are required that will fit in assembling without scraping them. The pieces are approximately three by two inches, having an irregular

FIG. 3. GRINDING AND SCRAPING COMPARED.

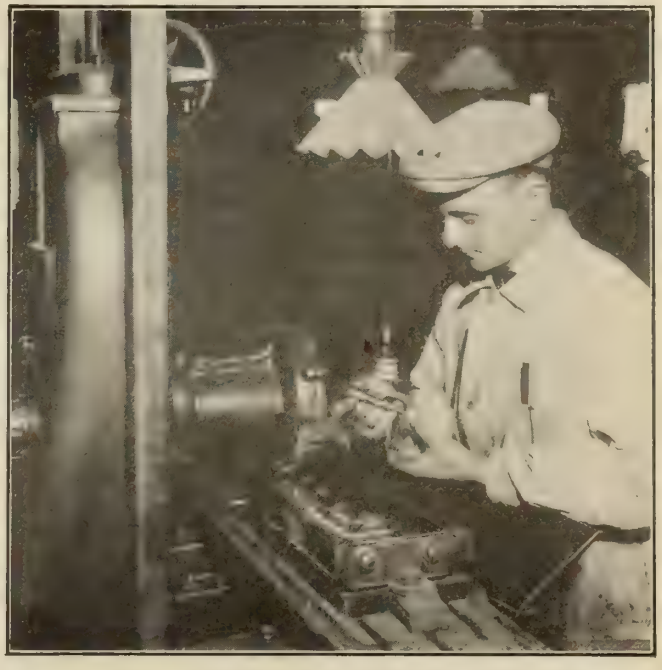

FIG. 4. GRINDING AND SCRAPING COMPARED.

outline. This work was done on a No. 2 Brown & Sharpe surface grinder equipped with a magnetic shoe. During some efficiency experiments with the pieces in question, it was found that when the shoe was practically filled, making a surface approximately 9x4 inches, the error owing to wheel loss was, in taking the finishing chip, only 0.0002 of an inch, which is generally considered close enough for commercial work. In grinding a surface 9x2 inches, which the illustration shows, the error was only 0.0001-inch. The slight error in both cases would seem to bear out the theory that a combination of automatic surface grinding, followed by scraping in cases where extreme accuracy is desired, would be the correct method. As a matter of fact the surface grinder is a very economical machine for both commercial and tool work, as the errors that have to be corrected by scraping are very slight.

Tool Room Work.

In grinding small surfaces in the tool room, the errors are often so slight as to eliminate scraping altogether. An illustration of this is shown in Fig. 3. Here it is desired to grind two surfaces that shall be accurate and square with each other. The work is held on an angle bracket, and after grinding, tested with a height gauge for accuracy. In cases where the work is carefully done, the error is often less than can be determined with the height gauge. It must, however be taken into consideration that skill on the part of the operator is necessary in producing accurate work on the surface grinder as well as by any other process. The illustrations given are all of small work, but it should not be inferred from this that the surface grinder is not capable of handling larger work in a satisfactory manner.

The Use of Cylinder Wheels.

The comparatively new types of surface grinders carrying cylinder wheels are giving satisfactory and economical results in cases where the principles of grinding with a cylinder wheel are understood. Here, again, the selection of a wheel is of the utmost importance, not only as regards material, grit, and grade, but also as regards its relation to the width of the work. Comparatively wide work calls for a soft wheel, while narrow work calls for a wheel a little harder than is used for wide work. Under favorable conditions where a reasonable amount of care is used, surface grinding machines carrying cylinder wheels will produce results that compare favorably with the average commercial scraping.

It is extremely doubtful if surface grinding machinery will ever reach a stage of development where absolutely (please note the word absolutely) plane surfaces can be produced on work of medium and large dimensions. We do not look for true planes in the products of the planer or milling machine, and why should we expect them of the surface grinder? Again, how many so-called plane surfaces that we see in machine construction are really planes or anywhere near planes? At the present stage of development the surface grinder can be made to produce as accurate work as the average that is turned out by scraping, and in cases where extreme accuracy is desired, if the grinding is followed by scraping to correct the very slight errors that may exist, the results are satisfactory, as the cost of production is greatly reduced by the elimination of a large amount of hand labor.

HOT PANEL AND HOT FLOOR BORDER SYSTEM OF HEATING.

At a recent meeting of the Junior Institution of Engineers, Capt. H. Riall Sankey, R.E., discussed the subject of "Hot Panel and Hot Floor Border System of Heating." He said that the dominant feature of the new method is the use of radiant heat rather than the heating of the air. The fact is often lost sight of that the object of heating a building or room is to make people comfortable, hence it is usual to specify that the heating power and heating surface shall be sufficient to maintain the temperature of the air 5 ft. from the floor at a specified temperature of say 63 deg. F. The result has been that most of the systems hitherto adopted have been devised so as to heat the air, therefore radiant heat has been, to a large extent neglected.

It is generally conceded that for comfort, when sitting in a room without a fire, an air temperature of about 63 deg. F. is needed, and in order to obtain this temperature the surfaces of ordinary radiators require to be at the fairly high temperature of say 150 to 180 deg. F. This temperature, however, decomposes the dust in the air thus producing a disagreeable and characteristic smell. When radiant heat from a fire is available, the air temperature can be as low as 55 deg. F. or even 50 deg. F., and yet the sense of comfort and warmth is greater than in the previous case. To maintain the temperature at 50 or 55 deg. a hot water system of heating or the like will, however, be required in many cases. Such a system although ideal, is more costly.

The Hot Panel and Hot Floor System does not unduly heat the air as it supplies the radiant heat needed for comfort. A Hot Panel, Capt. Sankey explained, consists esentially of a small pipe bent backwards and forwards and imbedded in a semi-conducting composition; ½-inch drawn, lap-welded steam pipe is used. The heat carrying medium, say hot water, circulates in the tube, and the heat is conducted through the walls of the tube to the composition, through which it spreads to the surface of the panel, whence it is radiated into the room; in effect, heat at a comparatively high temperature issuing from a small surface is converted into the same amount of heat at a lower temperature issuing from a large surface. A hot panel may contain more than one length of tube, in order that the flow in each length may be controlled by external valves, and it can be made up in an iron frame, thus forming a detached unit similar to the ordinary radiator, or it may be built up against a wall, approximating the thickness of the plaster.

Hot borders are formed by placing drawn, lap-welded ¾-in. pipes about an inch below the level of the floor, close to the walls, around the whole or part of a room, and imbedding these pipes in semi-conducting composition. A hot border of any width desired, say from 6 to 18 inches, can thus be formed. Similar pipes can also be imbedded along the cornices of a room. The semi-conducting composition has to be chosen with great care to obviate cracks which would otherwise be produced by the expansion and contraction of hot pipes. The various advantages of the new system were treated mathematically and a number of illustrations were given.

STEEL CO. AND FORT WILLIAM.

A Fort William report says that the president, vice-president and engineer architect of the Steel Company of Canada, the largest steel company in the Dominion, spent a few days in Fort William recently. They interviewed many prominent citizens, inspected the site which they own in the west end of the city, and left instructions to an accredited surveyor to fix the borders of their property. Although no definite announcement as to the intention of the Steel Company towards establishing at Fort William has yet been made public, it is generally understood that at no distant date they will do so.

WAGON COMPANY WOUND UP.

An order was made at Osgoode Hall, Toronto, winding up the Port Arthur Wagon Co. The order was made on the application of the German Bank, of Pittsburg, claimants for $10,000, and the Imperial Bank of Canada.

The company, which has an office at Markham, is said to have liabilities amounting to $350,000, and assets of $325,000.

The United States Steel Corporation and Canada

Staff Article

It is impossible to ignore the fact that Judge Gary's story of a twenty million dollar plant at Sandwich, Ont. was made while fears were being expressed that steel manufacturers would be driven out of the United States by the Democratic party's coming tariff revision. Is it not a scheme to frighten Chairman Underwood of the Ways and Means Committee?

THERE appears to be some connection between the attitude of the Democratic Party regarding tariffs, the sudden announcement by Judge Gary that the United States Steel Corporation will build a $20,000,000 steel plant at Sandwich, Ont., the rumors of steel manufacturers being driven out of the United States, and the story of a huge merger of Canadian and American steel companies.

The Ways and Means Committee of Congress has been sitting recently, headed by Representative Underwood, hearing evidence, and steel manufacturers claim that Mr. Underwood's methods have been arbitrary, and calculated to drive manufacturers across the border into Canada. What the Underwood Steel Bill will be like, remains to be seen, but manufacturers fear it will not be to their liking.

'We Are Going to Sandwich!'

A few weeks ago Judge Gary, president of the United States Steel Corporation made the following statement: "We have decided to establish a manufacturing plant at the site which we secured some years ago at Sandwich, Ont., just opposite Detroit. In the comparatively near future we shall commence the construction of some blast furnaces and mills. We shall probably build a wire mill, rail mill, structural mill, bar mill, and perhaps some other mills. I suppose the first cost will be in the neighborhood of $20,000,000."

Now, there seems to be good ground for believing that this statement is the result of the Democratic Party's attitude regarding tariffs. It has been received with dubiety all over the continent. It is something Sandwich has been expecting for ten years, and now that they have the twenty million dollar plant within their grasp, there are those who say that the statement is made to offset judicial action against the Steel Trust by the Democratic Party. The Detroit Free Press is dubious. It says:—"It is difficult to forget some matters connected with the present situation. The United States Steel Corporation has owned the land now mentioned for some six or seven years and has not heretofore proceeded to cover it with mills. It has erected a new city on the lakes in that period, but while Gary was unfolding its magical development, Sandwich lay vacant as ever. Yet the attractiveness of a Canadian plant was stronger all this time than now. The Trust was competing with Canadian industries that were stimulated by the liberal bonuses granted 15 years ago. They were protected, too, by the tariff, but the American rival stayed on its own side of the boundary, and managed to get a large share of the Canadian business despite its handicaps. The bonus system has been abolished within a year or so, and it is a little strange that just when the advantage of its benefits is withdrawn, the big steel company should decide to enter the field it has so long avoided. This phase of the matter does not tend to allay the skepticism that has come to attend the Sandwich story, it must be conceded.

Nor is it to be ignored that the announcement comes singularly apropos to the Washington tariff hearings and agitation for a higher Canadian tariff. Doubting Thomases will cynically ask whether there is any connection between these points. Can the New York dispatch have been sent out as a warning signal to the Democrats? Is it a hint to them that if they do not fix the duties at the proper point, there are other countries where enterprise is encouraged and where capital is assured of cordial reception?

Steel Merger in Canada.

As regards the merger of steel companies in Canada and the United States, it is the resurrection of a story that floated around Montreal during December, but was then received with incredulity. It has been resurrected owing to rumors coming from Washington, of dissatisfaction among steel manufacturers, and because of the United States Steel Sandwich story. This scheme, so the rumor goes, aims at a merger of steel companies in Canada and the United States, which would result in an industrial merger of even vaster proportions than the United States Steel Corporation. It would embrace in the United States some of the large independent steel companies headed by the Bethlehem Steel Corporation, and in Canada the Dominion Steel Corporation and the Steel Company of Canada. The other United States steel companies would include the Pennsylvania Steel Company, the Cambridge Steel Company, the Midland Steel Company and the Labelle Ironworks of West Virginia. The projected capitalization of this huge merger is $1,100,000,000 divided, it is understood, into $200,000,000 bonds, $500,000,000 and $400,000,000 common stock.

When the whole scheme was submitted to financial interests in Montreal some 5 weeks ago, directors of the Steel Corporation and the Steel Company of Canada averred that it was all news to them, and ridiculed its possibility. Since then it is said that plans of the syndicate, which is believed to be headed by Charles M. Schwab, have been laid before President Plummer, of the Dominion Steel Corporation, and before other leaders of the steel industry in Canada.

Schwab a 'Squealer.'

The scheme sounds feasible, owing to the fact that Mr. Schwab has been one of the leading 'squealers' over the activities of Mr. Underwood and his Ways and Means Committee. His attorneys were present at the sittings of this committee 'to get a line on the attitude of the committee,' and they are credited with the statement that Mr. Schwab would abandon the steel business in the United States if the Underwood Bill was passed by Congress and signed by President Wilson.

The Montreal 'Star' thinks Mr. Schwab is bluffing, and takes all these tales of big steel corporations coming into Canada, with a grain of salt. In its issue of January 8, it says: "It would not be well for Canada to take too seriously such assertions as that made before the Ways and Means Committee of the United States Congress that the Democratic Party's handling of the tariff is going to drive industries like the steel mills of Mr. Schwab across the borderline into the Dominion. There has never been any reluctance on our part to extend hospitality, fully and freely, to such new-comers. We hope and believe that the future will bring them in increasing numbers as an appreciation of the advantages that accrue from a Canadian plant become more and more obvious to the manufacturers of commodities which Canada requires. Events, however, have fairly well justified the belief that the manufacturers themselves were not likely to erect plants in Canada until the time was ripe for them to do so.

"For a number of years the United States Steel Corporation has owned a site at Sandwich, Ontario, presumably for the purpose of building furnaces and mills. Recently it has been announced that construction work is to

he begun at once. If Mr. Schwab, piqued by the lack of consideration shown his interests by Chairman Underwood, finds his attention focussed on the Canadian field, we have no more to lose from his close scrutiny than we have to gain by intemperate statements of his intentions. Canada has not yet become embarrassed by her riches in the shape of great manufacturing establishments, but our need is not so great but that we can see things in fairly accurate proportion."

What Mr. Plummer Thinks.

Mr. J. H. Plummer, president of the Dominion Steel Corporation, taking it for a fact that what Judge Gary says is correct, expresses the opinion that there will be less dumping when the United States Steel Corporation is definitely and openly in the field as a Canadian competitor for Canadian business, as the U.S. Company do business in a big way, and are fair fighters. They will, of course, have certain advantages from experience and from the large volume of business which they do. Much of their large export trade, especially to other parts of the British empire, would probably be taken care of from the Canadian plant, and this larger tonnage, due to the U. S. Steel's extensive selling organization abroad, would help the new competitor to keep its costs low. Mr. Plummer said he had not heard whether the Sandwich story was true or not.

No Canadian Merger.

Mr. Plummer knows nothing of the rumored merger of the Canadian Steel Companies, ostensibly in self defence. He suggested, however, what is doubtless true of most of the other steel companies, as well, that if an attractive and bona fide offer for the Dominion Steel Corporation came along, he would naturally be glad to submit it to the shareholders. Nothing new as to bounties, or tariff changes is known to Mr. Plummer, except the perhaps favorable sign that no negative decision has been given.

The company does not intend, at least now, to appoint a new general manager in succession to Mr. Butler. The corporation is now following the common English system of having men at the head of the works and commercial department, without a general manager above them. Mr. Plummer, as President, of course, really assumes such general functions, where necessary. He, moreover, has no present intention of giving up his duties, as has been rumored, although for personal reasons he would be glad to be relieved.

Causes of U. S. Dumping.

The serious dumping of steel products from the United States last year affected the Dominion Steel Corporation, among other Canadian companies, unfavorably. This will probably make the 1912 profits somewhat less than those of 1911, although the present year is expected to be better. The United States dumping was unusually severe, and, as Mr. Plummer thinks, due to two causes, the growing strength in the States of some of the independent companies, such as the Pittsburg Steel, and Jones & Laughlin, and the influence of politics. The United States Steel Co. was, because of tariff considerations, apparently more willing than otherwise to allow home prices to sag, and thus to render the Canadian dumping laws ineffective.

Rod Duty Essential.

A very prominent Canadian steel man says that if the U. S. Steel Co. comes, a duty simply must be put on wire rods, or the effect on Canadian companies will be very serious. Otherwise the U. S. Steel would bring in its own wire rods, duty free and profit free, while other companies, would buy at that price, plus the makers' profit, and so could not compete. This steel man thinks that unless such tariff change is made, there might be only two companies left in Canada, the U. S. Steel and one other.

If the U. S. Steel Came.

Judge Gary is unable to say just when the construction of the new plant at Sandwich would begin. Part of the initial cost will be financed by an issue of bonds. The corporation's business with Canada in recent years has ranged from 350,000 to 400,000 tons annually, representing roughly from $12,000,000 to $15,000,000.

It has been known for months that options were held on some 2,000 acres at Sandwich by attorneys who are representing the Steel Corporation, but the rumors that a plant would be built have been heard so frequently that but little attention has been paid to them. In point of location, the Steel Corporation's property in Sandwich is regarded as very desirable, being convenient of access for vessels of the company's fleet handling iron ore from the head of the lakes, and being on the route also of upbound steamers handling coal.

CANADIAN RAILROAD CO. EXPENDITURES.

FORTY million dollars will be expended in Montreal by the Canadian Pacific, Grand Trunk and Canadian Northern Railways within the next two or three years, the main expenditure to be in tunneling through Mount Royal. The plant for the tunnel will be very complete. There will be compressor plants at each end, electrically driven and consisting of one direct-connected, cross-compound unit of 2,200 cubic feet per minute capacity, and three cross-compound units of 1,100 cubic feet per minute. Pumps, drills and some small motors will also be needed and will be run by air. The drills used will be of the percussive type with the water attachment built largely of steel. Both gasoline and electric locomotives will be used.

The shops will consist of a blacksmith shop equipped with an air hammer, shears, punches, drill sharpening machinery and the usual forges; machine shops equipped with large and small lathes, a shaper, radial drills, saws and pipe machine; carpenters' shops with band and circular saws; drill repair and testing shops, as well as garages for the maintenance of automobiles and auto trucks. The work will be started this spring.

CANADIAN AGRICULTURAL IMPLEMENTS IN AUSTRALIA.

AS a result of comparatively good seasons, it is satisfactory to observe that the figures in the Australian returns for 1911 prove that Canada maintains a predominating position in the importing agricultural implement and machinery trade of the Commonwealth. The reason is obvious, and little comment as to the cause is necessary. The leading agricultural machinery manufacturers in the Dominion have, for a period of years, established branch houses in the principal Australian importing centres, and other Canadian makers are represented by capable selling agents who carry stocks of varied magnitude. The selling organization is as nearly perfect as ingenuity can devise, and fair trading, combined with the undoubted excellence of Canadian farming machines, has secured an enviable reputation for the goods. The lead held by Canadian manufacturers in these lines has been secured by effective local management, causing not only constant vigilance as to recurrent requirements, but also in anticipating the demand for perfected implements adapted to varied farming conditions. To secure the trade, it follows that the machinery imported must be suitable for the country, and, in a number of cases the implements are—through climatic and other reasons—of such character as to be unmarketable in North America.

The result achieved is an object lesson to Canadian manufacturers of other lines of merchandise as to what trade can be obtained in distant oversea markets by persistent effort while holding an equally prominent position in the home market.

THE DEVELOPMENT OF ST. JOHN, N.B.

THE following detailed statement shows the estimated expenditures on public works and buildings now under construction in St. John, N.B. The total construction on terminal improvements will, of course, be spread over a number of years:—

Dry dock, ship repair plant and wharves at East St. John, provisional contracts $11,500.000, estimated cost complete	$24,000,000
C.P.R., West St. John, million bushel elevator, additional yard accommodation, reclaiming land and erecting seawall	2,000,000
Dominion Government — present dredging grant, West St. John	900,000
Dominion Government — erection of wharves, sheds and terminal facilities, West St. John	2,600,000
Simms brush factory	350.000
Union Foundry extension	25,000
Automobile factory	50.000
Moore's saw mill	50.000
Armory	350.000
Theatre	100,000
Ames-Holden warehouse	75,000
Estimated expenditure on small buildings and residences under construction	150.000
	$30,700.000

In addition to the thirty million dollars shown above, buildings and works at an estimated cost of almost four million dollars, as shown in the following table, have been definitely decided on, although operations have not as yet started. These amounts bring the total cost of improvements in St. John, N.B., to the very large total of $34,660,000. In addition to this, it is estimated that several millions more will be spent by industrial concerns, etc., although no definite plans have yet been made.

New bridge, including street car tracks, between St. John and Fairville, estimated	$ 500.000
Bank of B.N.A. Building	150.000
Merchants Bank, remodelling	50.000
Post office	500,000
Sugar refinery, $100,000 put up as guarantee that construction will commence June, 1913	2,500,000
McClary Manufacturing Co.	75,000
Dominion Government — wharves, sheds and dredging for Marine and Fisheries Dept. (tenders called for)	185,000
	$ 3.960,000

LET THE FACTS BE KNOWN.

IF the Ontario Hydro-Electric enterprise is as successful as is claimed for it, there is no reason why there should be so much uncertainty as to the facts. It seems surprising that there should be such variant statements of actual conditions as those given by City Auditor of Toronto, Sterling, and those of John Mackay & Co. A similar difficulty in getting at the facts is apparent in the differing statements issued by the Hydro-Electric authorities and by the investigating commission appointed by New York State.

If the burden of cost of the undertaking is not properly distributed, if charges are not made to the proper accounts, if city lighting services are made to pay too much, so that private undertakings may receive power below cost; if these, or other wrong conditions exist, the facts should be made known to the public. In short, there seems no reason why there should be so very much public uncertainty about the whole matter or why facts of so much public concern should be so much matters of dispute, rather than of demonstration.

CHEAPER IRON FOR THE WEST.

WHEN the Panama Canal is opened for business, freight charges for both American and English pig-iron to the Pacific coast will be reduced, and there promises to be a hard fight between the furnaces around Birmingham, Alta., and those in Great Britain. At the present time English iron sells at Pacific ports for $22, whereas No. 1 Foundry from Birmingham costs in the neighborhood of $24.50. The result is that American iron is little seen in Washington, Oregon and California, but with the opening of the Panama Canal, a chance will be given to iron makers in the south .

It is then expected that pig-iron will be moved from Birmingham to Seattle for $5 a ton or less, thus allowing No. 1 Foundry to sell at $19.50, which is lower than the present English price. It must not be forgotten, however, that English prices will naturally be reduced also by the opening of the Panama Canal. The entire consumption of pig iron in the three above-mentioned States does not exceed 150,000 tons a year.

CANADIAN CAR & FOUNDRY CO.

THE Canadian Car & Foundry Co. has ordered three, single tandem, horizontal, double acting, four cycle engines, to be installed at their Fort William, Ont., plant. The engines, to be built by the Mesta Machine Co., Pittsburgh, at West Homestead, will have cylinderrs of 28-inch diameter by 36-inch stroke, and will operate at a speed of 150 revolutions per minute. Each engine will be arranged to drive direct connected a 600-kilowatt, 60-cycle 3-phase, 600-volt alternating current generator. The gas plant will be the largest producer gas engine plant in Canada, when completed. It will consist of four, double bituminous coal generator sets, furnished by R. D. Wood & Co., Philadelphia. The gas plant originally was intended for fuel gas purposes, but as it is necessary to intermittently change from the water gas operation to producer gas, it was decided to utilize the waste, or producer gas, for power purposes.

C.P.R. 1913 REQUIREMENTS.

THE rail requirements of the Canadian Pacific Railway Co., during 1913, will approximate 250,000 tons which, with the requisite fastenings, will represent an expenditure of over $8,000,000, according to the announcement made by Sir Thomas Shaughnessy, president of the road. The present orders for cars and locomotives, to be delivered before the end of 1913, aggregate $30,000,000, part of which will be spent in the United States, but the larger portion in Canada. Besides this, the important terminal works at Montreal, Toronto, Winnipeg and Vancouver and the large locomotive and car works at Ogden, near Calgary, will mean the use of a great deal of material and stimulate manufacturing in rail mill, iron and steel works.

UNIFORMITY OF SPECIFICATIONS.

IN a recent paper on "The Aims and Work of the International Electrotechnical Commission" Professor Silvanus P. Thompson pointed out that it would undoubtedly be of great advantage to an engineer if he were able to draft his specifications in terms which were practically identical with those not only in use in his own country, but also in other countries in which similar apparatus is in service. What an amount of misunderstanding would be avoided if this were made possible?

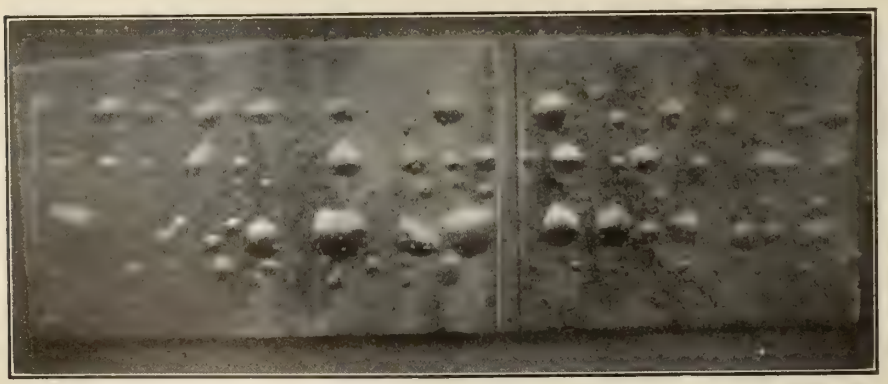
At the present time, a motor correctly described as a 10-kilowatt motor in one country is not necessarily a 10-kilowatt motor in another country, because the usages and regulations as to rating, and the requirements as to the physical tests which are made to determine the normal output of the motor, differ in different countries. Surely the same tests should be required and the same temperature rises should be named as permissible in the determination of the normal rating in whatever country the machine is constructed; otherwise the intending purchaser, who is offered by rivals in trade, machines of nominally the same output, has no guarantee that the competition is a fair one.

Allan Mosher and Austin C. Taylor have severed their connection with the Dominion Steel Castings Co., Ltd., Hamilton, Ont. They are giving their attention to the Stock Process Steel Co., Detroit, Mich., which has recently been incorporated and in which they are the principal stockholders.

The C.P.R. have outstanding orders aggregating $30,000,000 for cars and locomotives to be delivered before the end of the present year.

WHEN STEEL FREEZES.

AT a meeting of the Cleveland Institution of Engineers, held at Middlesbrough, England, recently, an interesting paper on "When Steel Freezes" was read by Dr. J. E. Stead, LL.D. First of all, Dr. Stead gave a general explanation of what occurred when the liquid steel changed to the solid state. When water passed into ice, each crystal as it formed had the same composition as the water. With steel it was quite different, for the first crystallites that formed were purer than the mother liquid. The octohedral fir-tree type of crystals fixed themselves on the side of the mould, and then grew inwards. While growing they entangled within their branches the greater part of the less pure and most fusible portion of the metal, which was rich in carbon, sulphur and phosphorus.



When a series of crystals grew side by side and developed from the cold sides of the mould, although the bulk of the impure liquid which was last to freeze was entangled in the crystals, a portion of it was always pressed forward, and mixed with the completely liquid steel inside. That accounted for the envelopes of ingots being purer than the average of the whole ingot. When separate crystals developed towards each other, they each drove forward some of the impure liquid, and this was eventually trapped between them. Before freezing, they formed irregular liquid envelopes around the crystals and were rich in carbon, sulphur and phosphorus, and when frozen constituted what was called "intercrystalline segregation." This was often found in serious quantities along planes radiating at 45 deg. to the sides forming the corners of the large ingot. The reason for this was that the crystals grew at right angles to the sides of the moulds, and meeting them near the corners the fusible impure parts were forced in and imprisoned along a plane at 45 deg. to the direction of growth. In small ingots this was not serious, but it was in the case of very large masses. To minimize this evil as much as possible, moulds with five, six or eight fluted sides were employed. Axial segregation was most pronounced when gas was driven off during solidification at the period when blow-holes formed in the partially solidified metal, which consisted of a solid purer part and a liquid rich in impurities. It might be taken for granted that if a mass of such a mixture were squeezed without cooling it, the impure liquid would be pressed out of it.

Cavities and Blow-holes.

Dr. Stead then dealt with the nature of the gas in cavities and blow-holes. There were several theories explaining what it was that initiated blow-holes in steel ingots. First, that the gases were more soluble in steel at high temperature than at low, and when the amount was in excess of what the plastic steel could hold in solution, they left the steel, passing out of solution. Secondly, that the gas which made the blow-hole was produced by the interaction of dissolved iron oxide and carbon, and was C O, a reaction that took place when the steel was cooling down and when it was in a plastic condition; thus $FeO + C = Fe + CO$. If this hypothesis were correct, it seemed reasonable to believe that the reverse might occur at higher temperature, $CO + Fe = FeO + C$. Thirdly, it had been suggested that hydrogen and nitrogen might initiate the gas bubbles.

In discussing those theories they must remember that the amount and nature of the gases finally imprisoned in the steel did not help one to any conclusion, for what was so left was not what would make the blow-holes, but what the steel could naturally hold in solution at the point of solidification and at atmospheric pressure. What one must judge by was the composition of the gases which were retained in the cavities, or which were evolved and escaped from the steel as it approached the point of solidification. Howe, in his classical work on steel, gave analyses of gases which escaped from the cooling steel ingots, some of which were made sound by silicon addition. Mr. Talbot, on the other hand, had in the course of his experimental trials at Cargo Fleet obtained gases from the central cavities of two steel ingots, one of which was very fiery and gaseous and honeycombed, and the other made dead sound by adding 2 oz. of aluminum per ton. The analyses of gases from Mr. Talbot's ingots showed that it was CO that formed the blow-holes, that hydrogen only passed out at surfaces and had not force enough to overcome the pressure of the steel itself and make cavities, and that hydrogen was always present in gases from cavities, because it readily left the steel at surfaces once they were formed.

Dr. Stead then dealt with blisters in steel sheets and produced a photograph one-third size of a blistered sheet. One of the most interesting features was that the blisters were in sequential order, many of them being parallel to others. He had not the history of the sheet, but the peculiar parallel arrangement suggested that the blisters represented blow-holes which had not been welded up or had contained oxide of iron or other substance which prevented union. Dr. Stead concluded his paper with a study of the fracture of a honeycombed ingot.

PHOTOGRAPH OF BLISTERED STEEL SHEET.

C. N. R. ORDERS.

DIRECTORS of the Canadian Northern Railway have announced their program of purchases of rolling stock for 1913. The sum to be expended aggregates $7,000,000, and it is noted that delivery of most of the items must be made before August 1, of this year. Apparently the intention is that the new rolling stock must be ready for use for the crop moving during the fall months.

To enable orders being filled within the eight months stipulated, the company have placed the building of the cars and locomotives with all firms manufacturing such throughout Eastern Canada. This will include Halifax, Amherst, Montreal, Preston, Cobourg, Hamilton and Toronto. The different classes of rolling stock ordered include 1,850 box cars, 700 flat cars, 300 ballast cars, 100 refrigerator cars, 150 stock cars, 76 passenger coaches, and 136 locomotives.

Hamilton and Cobourg will build 1,500 of the car orders, and Preston gets the order for the passenger coaches. Of the locomotives, 25 will be built in Toronto by the Canada Foundry Co. The company's car plant at Winnipeg will be fully occupied during the year building cabooses and rebuilding freight and passenger cars.

NATURAL GAS IN I.C.R. WORKSHOPS.

THE workshops of the Intercolonial Railway at Moncton, N.B., are now piped with natural gas, which is being used extensively for the generation of power. Experiments conducted for some time have demonstrated that the natural gas could be used more economically and to better purpose than the producer gas from the railway plant, and this latter is to be closed down and held in emergency reserve.

The entire railway plant is now supplied with the natural gas, which is being used under six large boilers, and in all forges and gas engines, as well as for heating purposes and for the generation of electricity for both power and light. It is also being used in the general offices and in the station as fuel, with the most satisfactory results. Further, successful experiments have been made in car-lighting, and pipe lines now supply the Pintsch gas producing plant, and the cars passing through Moncton are charged with natural gas for illumination.

CANADIAN SHIPBUILDING DEVELOPMENT.

IN view of Canada's offer of three super-dreadnoughts, the keels of which will, however, have to be laid down in the United Kingdom, it is of interest to note that very soon it will be possible to build ships in the Dominion as, according to all accounts, good progress is being made with the creation of the necessary establishments. Indeed, there are many competent authorities who do not hesitate to say that in the near future some of the finest vessels for the British Navy and mercantile marine will come from the Dominion.

Yard at Sydney, C.B.

The most important enterprise of the kind is associated with Sydney, Cape Breton, where the British-Canadian Shipbuilding Co., in which both the Fairfield Co., Govan, and Messrs. John Brown & Co., Clydebank, are interested, is now laying down plant. A site covering some 300 acres has been acquired, and, as a result of a plebiscite of the ratepayers, the municipal council has granted the company a bonus of 1,000,000 dollars ,in return for which, however, several important conditions have to be observed.

There are to be eleven slips, while the manufacture of guns, gun mountings and armour-plate will also be undertaken. In addition, there is to be a dry dock 1,150 feet long and 135 feet wide, with a depth on the sill at high water of 45 feet. Sydney, it may be mentioned, is the headquarters of two of the largest coal and steel companies in the Dominion, one of the latter having facilities for the production of 250 tons of pig-iron and 1,000 tons of steel daily, so that there will be an abundance of raw materials at hand.

Yard at St. John, N.B.

At St. John, N.B., where big harbor works are being carried out by Messrs. Norton, Griffiths & Co., the plans include a graving dock 900 feet long. It is also proposed to make provision for a huge shipyard, the firms of Messrs. Cammell, Laird & Co. and of Messrs. Vickers, Ltd., being prominently mentioned in this connection. The latter are, however, at present busy with operations at Montreal, where their floating dock, 700 feet long with a lifting capacity of 25,000 tons, is now available. According to the charter, the company has the right to manufacture steel in all its branches, and to transact general business as shipbuilders and repairers.

Further, on the Pacific Coast, at Esquimalt, B.C., Messrs. Denny Bros., of Dumbarton, are interested in a graving dock and shi, building company, which is to receive payment at the rate of 3½ per cent. for 35 years on an estimated expenditure of $2,500,000 for the construction of a dry dock 900 feet long, 122 feet wide, and 40 feet deep, while the building and repairing of ships will, it is expected, give employment to between 3,000 and 4,000 men. Other yards are being established at Vancouver and at Sault Ste. Marie.

HARDENING TWIST DRILLS AND TAPS.

A CONTEMPORARY gives the following methods of hardening twist drills and screw taps whereby maximum strength is said to be retained in the pieces treated:—The prepared drills or taps are held with their spiral or screwed parts submerged in molten lead (brought to red heat in iron or earthenware crucibles) till they too reach red heat. For pieces 3-16 in. to ⅜ in. in diameter this takes about one minute. The pieces are then withdrawn and at once plunged into water. If the lead bath is at the correct temperature, no lead will cling to the taps or drills on removing them. After chilling, the latter are cleaned and tempered.

A convenient method of tempering is to lay the drills and taps in lots of ten or twelve on a sheet of iron mounted over a charcoal fire. The plate should be rocked during the process in order that the pieces may be quite uniformly heated. On reaching a dark gold temper film, the articles are again water-quenched, and are then ready for use. The advantage of carrying out the first heating in lead instead of by direct firing is that the degree of heating is strictly limited, and it is impossible to burn the edges of the threads and drill grooves while waiting for the core to heat. Further, by the above process only the working parts are hardened, and the heads of the taps or drills can be subsequently worked if necessary.

SHIPBUILDERS WANT SUBSIDY.

REPRESENTATIVES of all the leading shipbuilding companies throughout the Dominion, waited upon the Right Hon. R. L. Borden recently, and described the keen competition which they had to meet. It was declared that unless assistance from the Federal Government was received they would be forced to abandon the struggle.

One of the spokesmen suggested the imposition of a duty on British ships, another thought such a plan would not prevent British ships from engaging in the coastwise trade, and proposed the payment of a bonus per net ton on ships built in Canada, and a subsidy on the cost of construction to the extent of about 20 per cent.

Premier's Promise.

The Premier promised due consideration when provided with a detailed statement by the shipbuilders. He was anxious to know for what period it would be necessary to aid the industry in order to ensure its continuance, adding that he had been told by a British builder that wages in Britain and in Canada tended to approximate in 10 or 15 years. The construction in Canada of vessels required by the Government might assist the companies of the Dominion.

Major Currie, M.P., introduced the deputation, which included Captain McDougall and Sandford Lindsay, president and secretary, respectively, of the Collingwood Shipbuilding Co.; John B. Miller, president of the Polson Ironworks, Toronto; Messrs. Black and Conn, representing the Pickford and Black Co., of Halifax; H. Bullen, president of the Esquimalt and Vancouver Marine and Dry Dock Co.; Geo. D. Davie, of Levis; S. Dyment and W. J. Fair, of the Kingston Dry Dock and Shipbuilding Co.

Torontonian's Testimony.

Mr. Miller, of the Polson Ironworks, said that at present the Canadian companies on the lakes had to confine themselves to ships which could not be built in Britain and sent through the St. Lawrence canals. On a vessel costing $120,000, the Canadian companies were taxed about $12,000 in duties on fittings and other "raw materials."

STANDARDISATION OF PARTS.

By "Cardilac."

THE makers of a certain machine tool for which they had held the market for a considerable time were feeling the effects of competition. Reduction of prices served as a temporary expedient to retain the trade. Finally, however, they were compelled to face the matter with a view to effecting such an improvement in the conditions of manufacture as would be sufficient to enable them to compete successfully with their rivals. The question of re-designing was considered. They held a large stock of parts which had become more or less standardised, some of them being common to several sizes. For their production special and costly tools had been devised.

To avoid the loss of capital which the modification of the parts would entail, the designer who had the matter in hand was given instructions that these parts must be incorporated in the new design. As a consequence, the new design, although improved in details in many ways, did not show as great a saving as was expected, and it became necessary to go still more deeply into the matter. Careful examination soon disclosed the fact that if no consideration had been given to the inclusion of the standard parts, more money would have been saved on each machine than was the entire value of the standard parts.

It would therefore, have, paid to scrap the whole of the stock in hand as well as the tools designed for producing the parts

Limits to Application.

The writer can cite many instances where, under the idea that standardisation is bound to pay, standard parts have been incorporated at a distinct loss. In fact, at one works the designers constantly complained among themselves of the chief's instance that standard parts must be used. Any appeal on the part of the draughtsman was without result. "The automatic machines must be kept running," or "it will cost more to change methods of production and scrap tools than the suggestion is worth," was the ever-ready response. Oftentimes, in order to use a standard part it was necessary to adapt it at a cost far exceeding its value—a dollar spent to save a dime. This, however, was not the worst aspect of the matter. Machines were rendered less compact than they ought to be; sometimes much more complicated. It did not pay to effect an improvement, and many such causes eventuated in the production of a machine which was not as suitable as it might be to its purpose.

Standardized Methods.

The very same result has been occasioned by standardized methods and designs in a certain American industry, and it is now suggested that a similar system of holding back progress towards perfection in design is to occur in England. Manufacturers are considering the advisability of standardizing their product at least in certain lines in exactly the same way. Whilst it cannot be doubted that a cheaper, perhaps better article will be thereby produced, there is at the same time a distinct danger that progress towards perfection in design will by this procedure have received its death blow. The effect on the present will be good, but the increased profits of to-day will be squandered in the losses of to-morrow. Just like the firms who in the good old days of various trade booms wrote down the value of plant to zero, and now if they make a 10 per cent. dividend place it to the credit of careful management, whereas in actuality that profit was made in the time of the booms, and if those booms had not been, neither would to-day's profits have been.

Careful Study of the Subject Commended

Standardization is all very well in its place, but it can be overdone in machine tool work. To standardize small parts common to many units is a valuable aid to dividend earning, but the standardization of the units themselves may result in the very reverse. It is the practice of some firms to build all the small units of machine tools in large batches. Some of these units are common to two, three or more machines, different in size. Naturally, the unit must be capable of fulfilling the requirements of the largest machine; hence, is unnecessarily large, if not cumbersome, for the smaller sizes. How far it is justifiable from the point of view of economy in production to adopt this form of standardization ought to receive the careful study of the manufacturer. It is to be feared that the consequences are not always fully considered. The saving to be effected by mass production is undeniable, but it has its limits.

The writer would unhesitatingly assert that it never pays to use the same unit for a smaller size if the cost of manufacture is not cheapened. If it would cost the same to make the smaller sizes even after adding to them the amount lost on the larger sizes by the reduced volume of production, make the smaller size. It is always necessary in applying some part larger than need be for its purpose, to make excuses for its presence, not merely to the client, but to one's own sense of the fitness of things. In many cases cumbersomeness would mean loss of efficiency in use. To move about large masses of metal in obtaining certain functions would tend to tire the operator and reduce output. In certain cases loss of power is entailed.

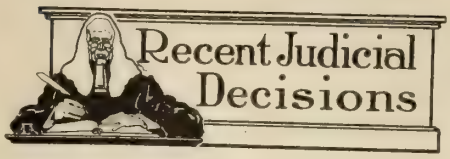
The question of wholesale standardization needs a vast amount of consideration in which the manufacturer would do well to give most careful attention to the points raised in the above random remarks.

INCREASED MILEAGE BETWEEN TIRE TURNINGS.

A TYPE of lubricator which was developed to meet the requirements of electric locomotive service through the St. Clair Tunnel was recently illustrated and described in the Electric Railway Journal. The oil for this lubricator is contained in an air-tight receptacle of one-quart capacity, whence it is led to the wheel flanges by pipes and sprayed upon the flanges by jets of air. The air is supplied from the main reservoir by a ¼-in. pipe, which is connected to the oil receptacle above the surface of the oil. A branch of this pipe is connected to the oil delivery pipe which leads to the flanges. When used with electrical equipment the air is controlled by an electric push button, so that the lubricant is applied only when needed, as on curves.

This apparatus has been in successful operation since July 10th, 1910. The six electric locomotives to which it has been applied haul 1,000-ton trains up and down 2 per cent. gradients on which flange wear had been quite heavy, owing to the many curves and the rather low centre of gravity of the locomotives. This lubricator has so improved conditions that 50,000 miles and more are made between wheel tire turnings. This means that the wheels can be removed for turning at the same time that the armature is removed for commutator dressing. The former mileage made between tire turnings was from 12,000 to 25,000 miles. Filtered reclaimed armature bearing oil is used as the lubricant.

THE TRAINING OF SALESMEN.



IN order to train their salesmen along practical lines the Carnegie Steel Company established a school to show the men how iron and steel and their products are made, to familiarize them with the materials they sell, to illustrate the care exercised in the various processes, and to demonstrate wherein the goods excel those of competitors. A paper read recently before the American Iron and Steel Institute by Mr. J. M. Camp contains an account of the course of instruction adopted.

The first few days are devoted to the

general principles of the manufacture of iron and steel, followed by a treatise on the foundation of the industry and the Lake Superior ores, with an account of their commercial grades and the different ranges, and of open cut, milling, and underground mining. The operations of loading the boats and transferring the ore to the cars and to the furnace bins are dealt with, and also the actual process of coke making. The requirements constituting a good quality of limestone are explained, and, with the necessary raw material on hand, the next few days are spent in studying the construction and operation of the blast furnace, together with the Bessemer and open-hearth processes and the manufacture of steel, its composition, testing, and analysis. A study of rolling mills and their products concludes the technical instruction, and the rest of the tuition relates to the path followed by orders from the office and other matters connected with clerical routine. It is stated that, so far, 25 students have passed through the course, with results that are regarded as gratifying to both the salesmen and the officials of the company.

CUTTING AND GENERATION OF GEAR TEETH.

A PAPER on "The Principles and their Application in the Cutting and Generation of Gear Teeth by Modern Gear Cutting Machinery" was read before the Manchester Association of Engineers, recently, by Mr. Vincent Gartside. The paper was intended to be of practical value to the "man in the shop" who has to deal with the use or production of cut gearing.Descriptions of the most common forms of teeth, namely, the cycloidal and the involute, were first given, after which the author went on to describe the different processes employed in cutting the teeth, dividing them into two main classes—non-generating and generating. Under the head of non-generating, the author described the three systems of milling, planing and forming. The paper included descriptions of the leading types of gear cutting machines now in use, including those made by Darling and Sellars, the Fellows, Sunderland, Holfoyd's worm gear milling and grinding machines. The section dealing with helical and spiral gears contained brief descriptions of the different types in use, including (1)—the simple spiral or single helical gear cut with disc cutters or hobs or planed; (2)—the Lewellen double helical gear cut with disc cutters ; (3)—the Wuest gear cut with hobs; and (4)—the Chevron gear with multiple helical teeth cut by end mills.

Montreal, Que.—Judge Lafontaine recently awarded a workman a pension of $100 per year for loss of a foot that was amputated through being frost bitten while following his employment.

Toronto, Ont.—On the ground that Michael McCormick, a C.P.R. contractor, did not guard against falling rock, Chief Justice Falconbridge has dismissed the appeal from judgment against his company in the case of George Dallontania, who was awarded $6,000 damages for injuries sustained in the C.P.R. tunnel near Sudbury.

Calgary, Alta.—At the enquiry into the death of George Beuk, the jury found that he met his death from shock and burns received from an explosion of natural gas in the basement of the Queen's hotel, Dec. 8. The explosion was due to a defect in the gas service in and around the said Queen's hotel, due to negligence of both the Canadian Western Natural Gas company and the City of Calgary. They censure the city of Calgary for not having a proper official on the scene immediately after the explosion.

Los Angeles.—The complaint in the long-expected suit of the Federal Government against the Southern Pacific railway, involving title to $250,000,000 worth of supposed mineral-bearing lands in Fresno county, has been filed. The suit is filed under the act of Congress passed July 27, 1866, requiring the department of the interior to exempt mineral-bearing lands in issuing patents to railroads. The land is, for the most part, in the Coaling oil field.

Montreal, Que.—Judgment has been handed down by the Dominion Board of Railway Commissioners disallowing the increase of cartage rates on freight proposed by the railway companies to be effective in Eastern Canada, but providing that the companies may impose rates not exceeding two and a half cents per hundred pounds and that the minimum toll charged for any complete single shipment shall not exceed fifteen cents. While granting a half cent increase per hundred pounds to the railroad companies, this judgment materially decreases the rates they proposed to charge. On October 7 of last year, the companies amended their tariffs, imposing a charge of three cents per hundred pounds, and a minimum rate of 20 cents in Montreal. The change was to have become effective on November 11.

Toronto, Ont.—An agent of the London Machine Tool Co. named Strong, brought action to recover commission upon the sale of the assets of this company to the Canada Machinery Corporation. Mr. Justice Middleton's decision was as follows: "I do not think that either plaintiff's or defendants' contention is sound, and that when defendants accepted plaintiff's services as intermediary in promoting the sale, he became entitled to receive a commission. The sale he arranged falling through, the dependent agreement also came to an end, but I think plaintiff is entitled to something because he set on foot the negotiations which ultimately resulted in the transaction actually carried out. I have difficulty in determining the amount that should be recovered, but, bearing everything in mind, I think the sum of $5,000 would be fair."

Montreal, Que.—Sidney Levine, a commercial traveler, has been awarded $100 damages in a libel suit entered against the C.N.R. Company. Levine was accused of having attempted to defraud the company by presenting an irregular ticket to the conductor of one of the company's trains west of Winnipeg. The charge was embodied in a communication and sent to the secretary of the Dominion Travelers' Association by one of the company's officials, alleging that the plaintiff's certificate of membership had been cancelled on the ground that he was not worthy to enjoy the privileges attached to membership in the organization.

Toronto, Ont.—A piece of iron crashed into a house 700 yards away from the Canada Foundry plant recently, where dynamite was being used to break a casting, doing $200 worth of damage. Under section 247 of the Criminal Code, the Canada Foundry were charged in the police court, and after hearing the evidence, and an explanation from Chas. Farr, who conducted the blasting operations, the magistrate remanded the case till called on. Assistant Crown Attorney Hughes remarked that this would meet the case, as it would serve to make it known to all, the liability which any one using explosives was under.

The section of the code under which the charge was laid reads as follows:

"Every one who has in his charge or under his control anything whatever, whether animate or inanimate, which, in the absence of precaution or care, may endanger human life, is under a legal duty to take reasonable precautions against and use reasonable care to avoid such danger, and is criminally responsible for the consequences of omitting, without lawful excuse, to perform such duty."

STEEL BELTS FOR POWER TRANSMISSION.

Steel belts have been used during the past year in some of the large manufacturing plants at Huddersfield, England, and have proved satisfactory. It is found that a 7⅞-in. steel belt, weighing 119 lbs., does the work formerly done by a leather belt 22 ins. wide, weighing 814 lbs., driving 300 h.p. In another mill a 3½-in. steel belt, weighing 12 lbs., does the work of a leather belt 12 ins. wide, weighing 64 lbs., driving 40 h.p. The steel belt saves space, does not slip or stretch, and gives greater efficiency of power delivery. Tests have shown a saving of 61 h.p. on a drive of 640 h.p.

THE MODERN GAS PRODUCER.

THE development of the gas producer formed the subject of a paper read before the Liverpool Engineering Society, recently, by Mr. F. Fielden. He said that the gas producer method of combustion is most commercially profitable with light moist fuels. He gave examples where spent tan, containing as much as 50 per cent. of moisture, is used in producers, the fuel being first gasified and the gas burnt in boiler furnaces. Such a plant has been working for some years at a tannery in Runcorn, while a more recent installation said to be the largest in the world for dealing with this waste product, is one of 700 horse-power now being erected at Ditton, in which 300 horse-power is to be used for power purposes and 400 horse-power for combustion under existing steam boilers. With a moisture content of 50 per cent., the consumption per brake horse-power hour amounts to approximately 3½lb., and the gas produced with this weight of spent tan is from 70 to 80 cubic feet at approximately 125 to 135 B.Th.U. per cubic foot on the lower scale.

On the subject of the application of gas power to marine purposes, the author said that the successful gas producer should be (1)—of the bituminous type, (2)—with open-hearth firegrate, (3)—with cascade type of washers and coolers in which no loose pieces of any description such as coke, earthenware, &c., are employed, (4)—with rotary tar extractors, and (5)—having the gas pipe connections to the engines so arranged by means of suitable cocks that when the gas is suddenly cut off from the engines, the same movement of the valve lever by-passes the gas to a boiler adapted to both gas or solid fuel firing, the boiler being used to supply steam for working the winches, etc.

A NEW ALLOY OF IRON THAT IS RUSTLESS.

CHEMICALLY pure iron—that is (Fe) without carbon or other alloy—is quite free from oxidization; but it lacks the strength of steel and will not resist abrasion well. For certain purposes, however, like corrugated metal culverts, fence wire, etc., pure iron has been used with great economic advantage. If reports are correct, a rustless alloy of iron has been recently made in France. Professor Borcheris of Aix-la-Chapelle, a well known metallurgist, is credited with having produced an iron alloy which resists even boiling nitric acid. The alloy consists of ferro-chrome (having very little carbon) and molybdenum. Titanium and vanadium give results not quite as favorable as molybdenum. The important question of cost is, as yet, unanswered, as is the question of strength. Nevertheless, we have in this announcement a finger post that may point the way to securing a commercial, rustless iron alloy for use in engineering structures and machines.

ELECTRIFICATION OF RAILWAYS.

AN American engineer has recently pointed out in connection with the electrification of railways that if the choice of system rested only on the locomotives, undoubtedly the standard 600-volt direct-current system would be chosen in the large majority of cases as being the simplest and best adapted for the work, but for the electrification of a main line this is an economic impossibility, because the low voltage requires too great an expenditure for sub-stations, which must not only be large but numerous. The efficiency is too low except where the traffic gives a good load factor. It is only possible with a third rail system on account of the enormous currents required. It is, therefore, generally accepted as a fact that the current must be taken from an overhead trolley. It then becomes a question as to how much current can be collected from an overhead wire, and this is really the most important problem of any. It is probably safe to say that a current of 200 to 300 amperes may be continuously collected at high speeds, either by wheel or some form of roller or sliding shoe. The wheel can scarcely be considered for high-speed locomotive work for obvious reasons, but both roller and sliding pantagraph trolleys have been used.

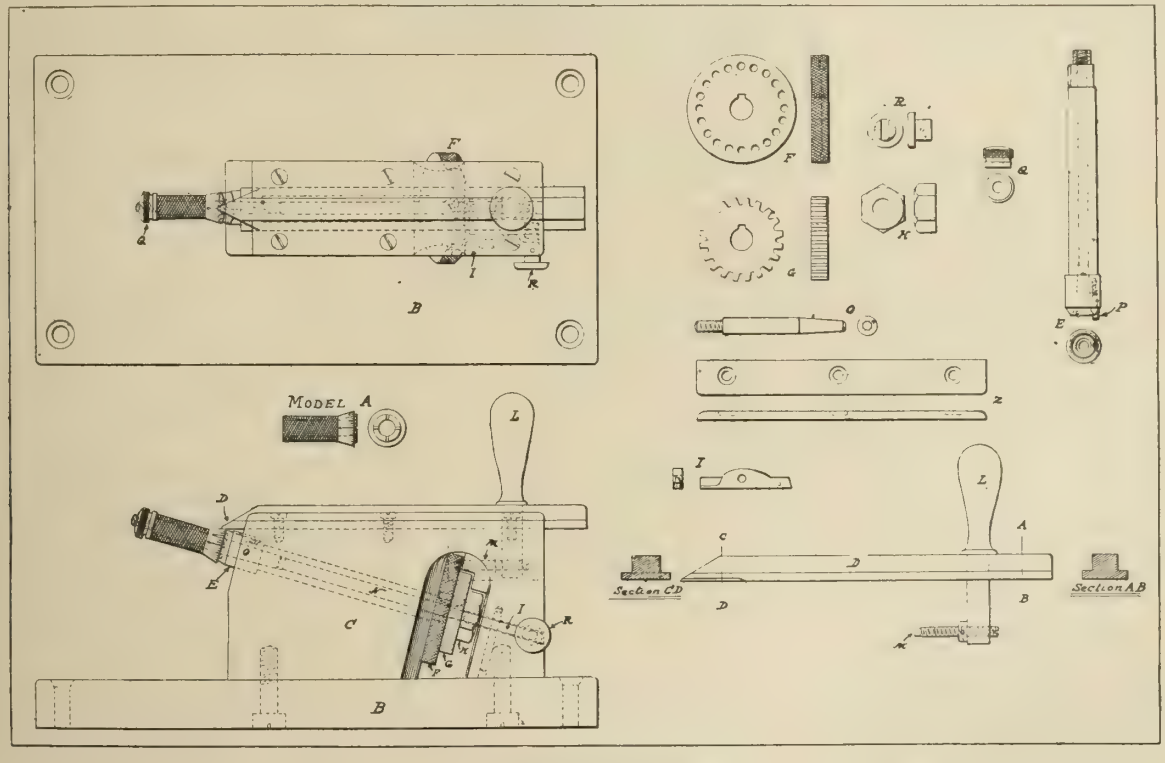
Mr. H. J. Fuller, president of the Canadian Fairbanks-Morse Co., and **Mr. F. P. Jones**, general manager of the Canada Cement Co. have been elected directors of the Canadian Bank of Commerce.

The Albion Motor Car Co., Ltd., of Glasgow, Scotland, a large manufacturer of motor trucks, has arranged to establish a factory garage for assembling cars in Montreal and proposes in the near future to manufacture in Canada.



MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

A GRADUATING FIXTURE.

By A. L. Monrad.

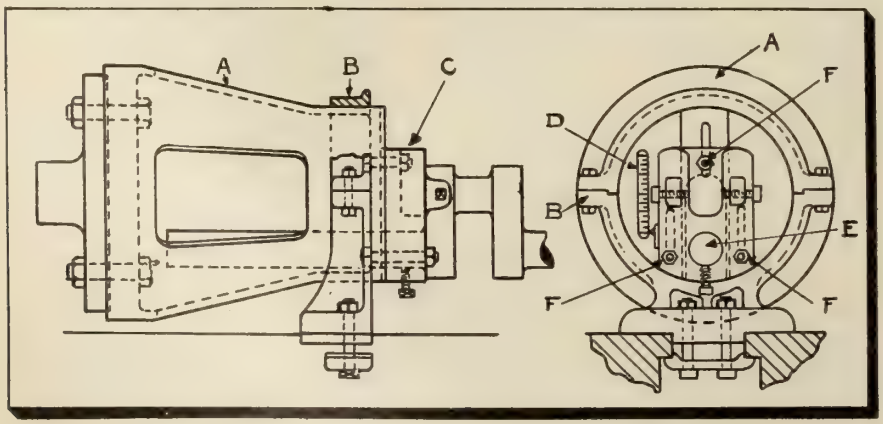
THE illustration represents a very simple, but absolutely accurate graduating fixture to cut twenty-five divisions on a thimble (A), indicated in the drawing. Lines on this thimble were at first rolled in a machine; but that method proved very unsatisfactory for the simple reason that after the thimble had been turned and finished on the automatic screw machine, the diameter on the angle was found to vary a thousandth or two, and when the divisions were rolled, the last line would be considerably thicker than the rest, sometimes twice as thick. It was therefore decided to discard the graduating machine entirely and a new method was adopted which has proved entirely satisfactory. The cuts of the lines are made one ten thousandth deep, so that when the diameter on the thimble varies by a few thoussandths it makes no material difference, as the depth of the lines can hardly be noticed.

A GRADUATING FIXTURE.

In detail the fixture is made as follows: It is held with two screws on a cast iron plate (B), which is planed all over. In each corner is drilled and counter-bored a hole for a wood screw, so that the plate can be fastened on a bench during operation. The block (C) is made of cast iron, and finished all over. On the top of it is milled a straight ¾-inch slot to a sliding fit for the cutter (B). In the bottom of this slot, at one end, is milled an elongated pocket to allow the stop screw in the cutter to move back and forth freely. In the centre of the block is bored, reamed and counterbored a ⅜-inch hole on an angle of 15 degrees. This is a turning fit for the spindle (E.) Through the other end is drilled a ⅛-inch hole to be used for the arbor knockout rod. At right angles with the spindle hole is milled a ¾-inch, three-step plate to accommodate the stop plate (F), index plate (G) and the spindle nut (H). On the centre line and parallel with the spindle a ⅛-inch slot is milled on the side of the block to fit the index finger (I). A 5-16-inch hole is counterbored on the end of this slot to receive the spiral push spring and button (R).

The cutter slide (D) is made of tool steel with a sliding fit in tthe block, and is T-shaped on the bottom. It is held in place by a steel plate (Z) which has three fillister screws on each side. The cutter slide is operated by a steel handle (L), driven in on top. On the bottom end of this handle is fitted a hardened stop screw (M). The other end of the slide is machined to a V-point. This end is hardened and drawn to a light straw color. The tool steel spindle (E) is made a turning fit in the block. A ⅛-inch hole is drilled through its centre for the knockout rod (N) which knocks out the arbor (O), when changing for a different length of thimble. On the end of this spindle fits a stop plate (F) and the index plate (G), these being held securely in position with a woodruff key and a nut (H).

The other end of the spindle is recessed to fit the bottom of the thimble, the outside diameter being slightly smaller than the work. In its centre is a taper reamed to fit the different lengths of arbors. On the one side of the arbor hole is located a spring plunger (P) held in position with a stop. The thimble (A) has two round grooves milled across its centre line at right angles to each other. These sometimes vary in depth. Therefore, when the thimble is placed on the arbor it will always locate itself central



with the plunger, as the long lines on the thimble must be central with the grooves. A knurled nut (Q) on the end of the arbor tightens the thimble securely in place.

The stop plate (F) has 25 stop holes milled on an angle of 15 degrees. Every fifth hole is 1-16 inch longer than the others, so that when the stop screw (M) comes up into the plate hole it cuts the division lines automatically short and long. This plate is made of tool steel, hardened and drawn to a light straw color. On the index plate (G) are milled 25 tapered grooves equally spaced. In these grooves the index finger (I) fits and is held to the block with a ⅛-inch pin in a rocking position. A spiral spring on the other end of the index finger holds the pointer down into the grooves. By pushing down on the button (R) with the right thumb, while the left hand turns the knurled stop plate round, the index finger locates itself into the index plate. Push the handle up to a stop and back again. Repeat the same motion until the 25 divisions are all cut automatically.

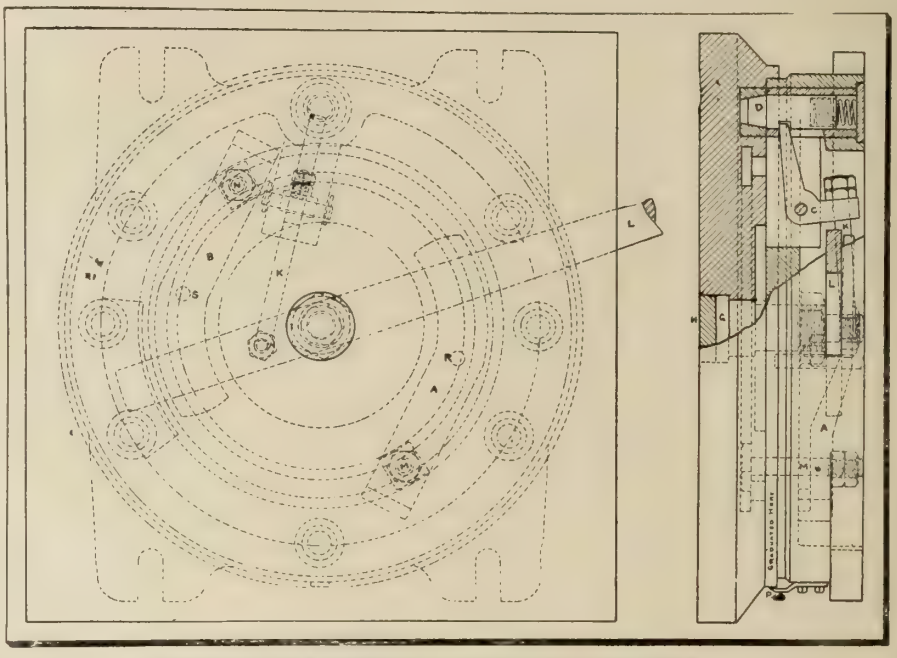
A CRANK SHAFT TURNING JIG.

By G. Barrett.

THE cut herewith illustrates a useful jig for turning crank shafts. The stool (A) is secured to the lathe face plate by four bolts and at its other end runs in a cast-iron steady rest (B), which is bolted to the bed plate. It will be noticed that the large end of the stool (A) is recessed to fit the face plate to ensure its running true when replaced. The smaller end of the stool is equipped with an adjustable bracket (C), which receives the web of the crank and also

A CRANK SHAFT TURNING JIG.

the end of the shaft—the latter being inserted through the hole (E). To fit this hole there are a number of steel bushings bored to suit various sizes of shafts.



By means of the three bolts (F) the bracket (C) is adjusted to suit the throw of the crank, the reading being given by a pointer and an ordinary 4-inch steel rule (D) pinned to the face of the stool. The right hand end of the shaft is carried in the usual way on the loose spindle by means of a crank block. The use of this jig not only increases the accuracy of the work, but also decreases the time required by about 50 per cent.

A MILLING MACHINE TURRET.

By D. O. Barrett.

IN ANY gas engine shop there is always considerable milling work of various kinds on which a turntable or turret can be used. A great deal of this is straddle milling, such as connecting rods, rocker arms; also facing and boring beds, etc.

This turret is especially handy for opposed engines, in boring the beds for the cylinders and other parts. It may be used on a milling machine or horizontal boring mill, the table being set over an amount equal to the distance between the centre lines of the cylinder and the base. When the turret is turned 180 degrees the opposite cylinder opening is brought into alignment with the spindle. This same method may also be used with other holes, finished pads, etc. The turret shown is not so much used for directly clamping pieces to be machined thereon, but rather for holding jigs, some of which may have even been used on other machines. It will soon pay for itself as there is an endless variety of work for which it is suited.

TURRET ATTACHMENT FOR MILLING MACHINE.

The body, or base, of the turret is equipped with a set of four lugs to suit the machine on which it is to be used. Steel guides are inserted in the bottom of the bed for locating in the table slots. Should it be desired to use it on a machine other than the one for which it was originally designed and with a different arrangement of slots, two diametrically opposite clamping bolts could be used and an extra slot milled in the bed to accommodate the steel guides. The upper face of the bed is finished flat with a raised portion in the centre, about which the table turns. The shoulder bolt (G) holds table and bed together. The large nut on the under side of the bed tightens the shoulder bolt, but this is not used in any way for clamping down the table, merely holding it in its proper position. To exclude dust a plug (H) is placed in the table over the shoulder bolt. Around the under side of the table and of as large a diameter as practicable is cut a circumferential T-slot, in which are the clamping bolts (M) and (N).

The flat pieces (A) and (B), through which the bolts (M) and (N) pass, are turned up square at one end to bear against the under side of the bed, while the other end is made on a taper. To secure effective clamping, the holes for the bolts are drilled near the turned-up ends. The pins (R) and (S) hold (A) and (B) in their proper positions at all times; these are simply straight pins driven into the bed. The clamping bolts are supplied with locknuts so that necessary adjustments can be made at any time.

Below the larger threaded portion of the centre bolt (G) is a bearing, turned smaller than the thread diameter, about which the lever (L) operates. Below this the pin is again threaded, and nuts hold up the lever. This lever reaches across the base so as to operate both the clamping pieces (M) and (N), bearing against the tapered portions of each. As the lever is pulled to the left it forces these down and effectively clamps the table.,

The upward thrust on the lever is taken up by the edge of the bed on the one side and by a special pad on the other. Operating from the lever (L) is a rod (K), which slides through the forged bell crank (C), adjustment of length being made by locknuts. One end of the bell crank engages the slot in the tapered indexing pin (D), which is pushed up into the indexing bushings by the heavy spring at the bottom, this being held in by the plug shown.

It is thus seen that as the handle is pushed to the right the tapered clamping pieces are released and the index-

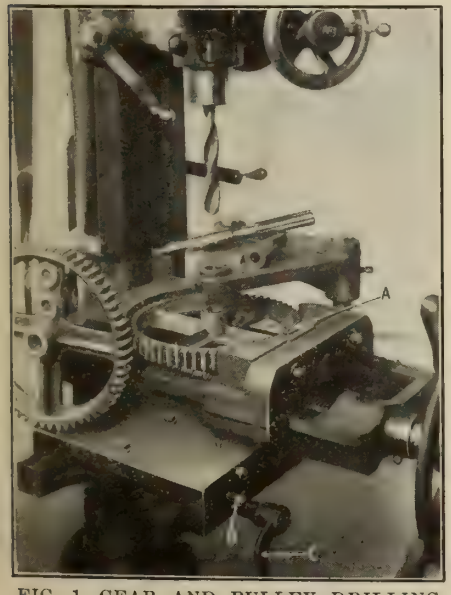


FIG. 1. GEAR AND PULLEY DRILLING AND REAMING FIXTURE.

ing pin drawn, all in one operation, by the use of one hand, leaving the other hand free to turn the table. Pulling the lever to the left allows the indexing pin to be pushed into place and any extra movement of the lever simply slides the rod through the bell crank. The clamping is done on opposite sides of the table and at considerable dis-

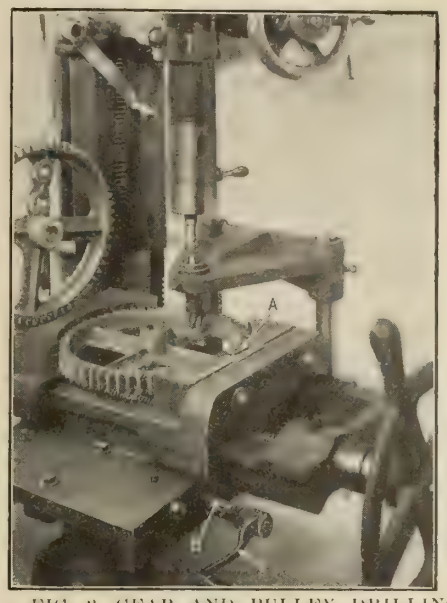

FIG. 2. GEAR AND PULLEY DRILLING AND REAMING FIXTURE.

tance from the centre, making it very effective.

The table in this particular case is shown with indexing bushings for 60 and 90 degrees positive spacing, although more could be supplied as warranted by the work. The table projects down over the outside of the bed, forming a dust guard and protecting the wearing surfaces. This portion of the table is graduated in degrees and a pointer (P) is attached to the base. The table can be indexed to any desired point, as the index pin will simply be pushed up against the under side of the table by the spring and the rod (K) sliding through the bell crank.

The table is here shown square, but could be made round or otherwise for special purposes. The T slots should also be arranged for the work in hand.

GEAR AND PULLEY DRILLING AND REAMING FIXTURE.

By Avery E. Granville.

WE use a great many cast-iron gears in which three holes must be drilled and reamed, and have made the special fixture shown in the accompanying cuts, to facilitate the work.

The main part of the fixture, as shown in Fig. 1, consists of a vise with formed jaws made of cast iron, into which a steel block (A), is fitted to locate the gear to be drilled, a tooth at right-angles to the arm to be drilled fitting the slot in this block. This vise is fitted to a base or cross-slide, which may be moved to give the different drilling positions under the spindle.

The various drilling positions are located by means of the pin (B), which fits index holes in the slide. A handle (C) turns a shaft which has a pinion on it meshing with a rack under the base, thus making it easy to move the fixture to the desired place. A bracket set on strong posts that are fastened to the table of the drilling machine, is used to hold the various bushings. This bracket is shown in Fig. 1 with the drill bushing for the hub in place. For reaming this bushing is removed entirely. The fixture set for the drilling of one of the crank holes is shown in Fig. 2. A bushing is also shown slipped into the larger one, to guide the drill used. By removal of the steel piece (A), the vise is used for the drilling and reaming of a special sized pulley, as shown in Fig. 3. After these pulleys have been reamed, they are pressed onto a mandrel and the rim is turned.

Where a firm has gears or pulleys that are run through in large lots, a fixture of this type will prove extremely valuable With slight modifications, it can be made to take any ordinary size.

DOMINION STEEL CORPORATION.

MR. J. H. PLUMMER, President of the Dominion Steel Corporation, spent a few hours in Montreal recently. He said that the coal department of the corporation was doing an excellent business, and that the steel plant was very busy at present, there being five blast furnaces in full operation, and the coke ovens working well. He intimated

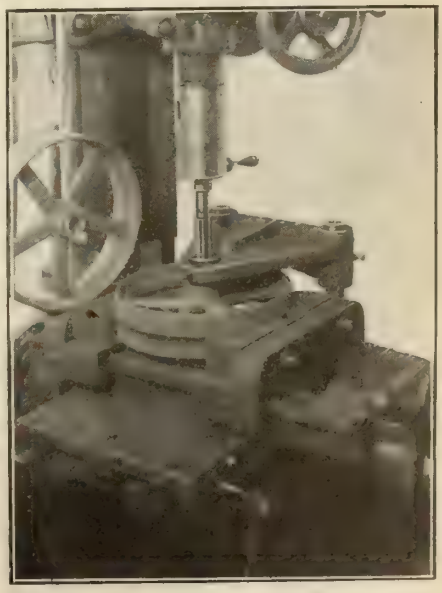

FIG. 3. GEAR AND PULLEY DRILLING AND REAMING FIXTURE.

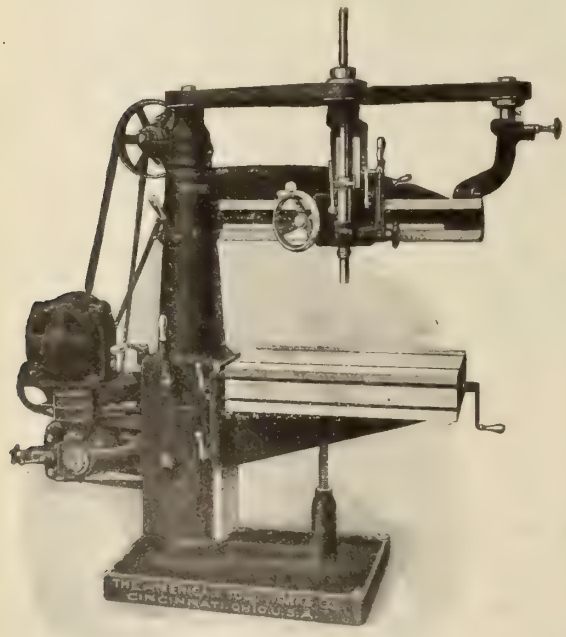
that the output of the steel products will be a record one this year, but profits are likely to be curtailed by lack of a bounty or tariff on wire rods.

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

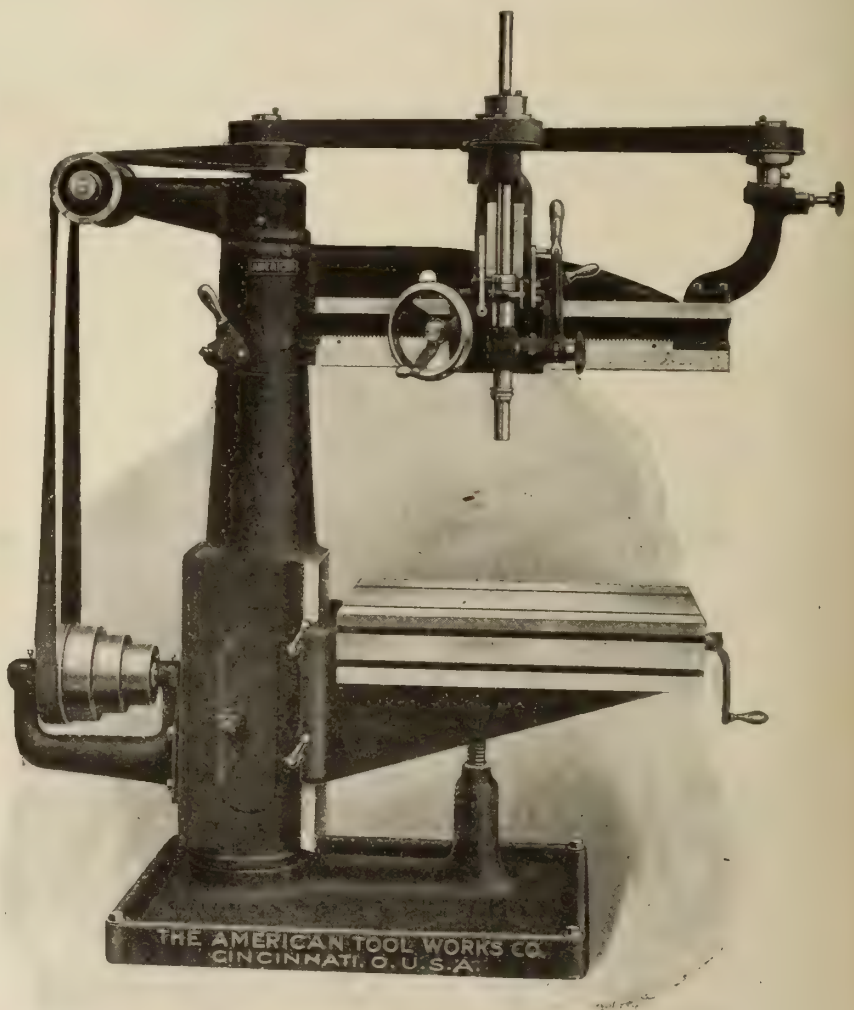


HIGH SPEED SENSITIVE RADIAL DRILLS.

THE illustrations show a line of high speed radials recently developed by the American Tool Works Co., Cincinnati, Ohio. These have been specially designed and built for drilling and tapping small diameter holes at high speeds, the aim being to combine the high speed efficiency of the plain sensitive drill with the productive capacity of the radial. In this manner the drilling and tapping of holes up to and including ¾-inch diameter, in such work as automobile parts, cash register details, etc., can be accomplished with great economy. An essential feature in such drills is the ability to cut down the time occupied, after one hole is drilled, in setting the machine for the next. This point has been kept in mind in the design, and all levers and operating members are placed in convenient positions for the operator. The feed lever is located on the head, directly in front of the operator, on his right side. An advantage of the ratchet feed lever used on these drills is the fact that when the lever is placed in its vertical position it is automatically disengaged from the rack pinion shaft and the spindle can then be adjusted quickly up or down by means of a small star knob on the end of the rack pinion shaft. The head can be moved rapidly along the arm by means of a rack and pinion operated by a hand wheel. The latter is located on the front of the head on the left of the operator, who can thus swing the arm with his right hand and at the same time adjust the head along the arm with his left.

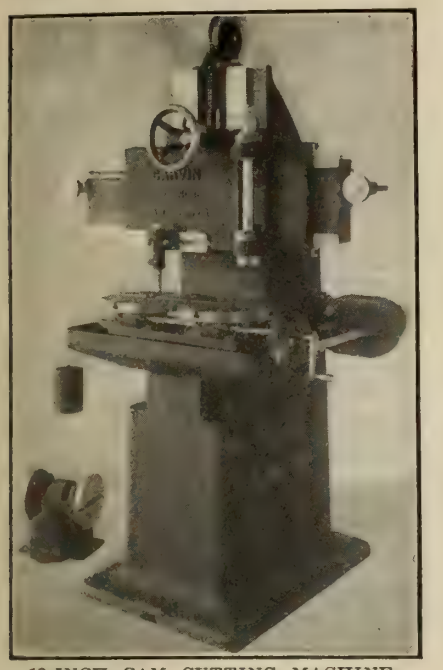
The head consists of a main saddle which has a bearing on the arm and carries an auxiliary sliding head upon a vertical dovetail. This sliding head is so arranged that it can be moved to or from the table, enabling a wide range of work to be accommodated.

The "American" sensitive radials are built with stationary or elevating tables, or with pedestal base (no table) for large castings. The elevating table is of semi-box construction, with a wide bearing on the face of the column. Its vertical movement is derived from the elevating screw, which is operated through mitre gears by a crank in front.



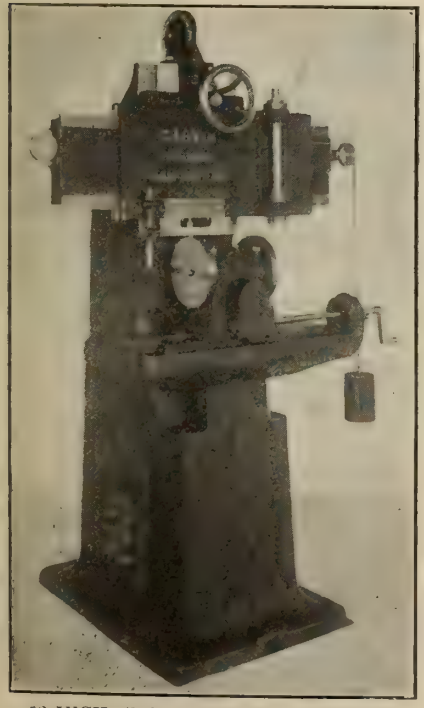
There are no gears anywhere in the driving mechanism of these drills, the drive being by a 2-inch double belt running at a high rate of speed. The spindle belt tension is regulated by turning the star knob located on the bracket at the outer end of the arm. The spindle is provided with a dust-proof self-lubricating ball thrust bearing and has six changes of speed, from 300 to 900 R.P.M. in geometrical progression. It is fitted at the top with an adjustable stop collar which may be used as a depth gauge.

MOTOR-DRIVEN "AMERICAN" SENSITIVE RADIAL DRILL, WITH ELEVATING TABLE AND TAPPING ATTACHMENT.



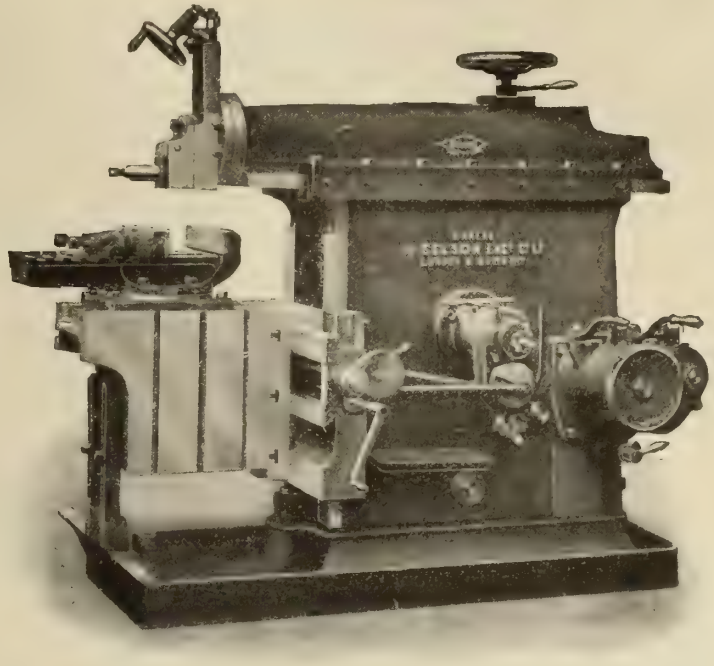
12-INCH CAM CUTTING MACHINE.

THIS machine has been designed by the Garvin Machine Co., New York, to meet a popular demand for a minimum sized cam cutting machine. It is well



"AMERICAN" SENSITIVE RADIAL DRILL WITH ELEVATING TABLE.

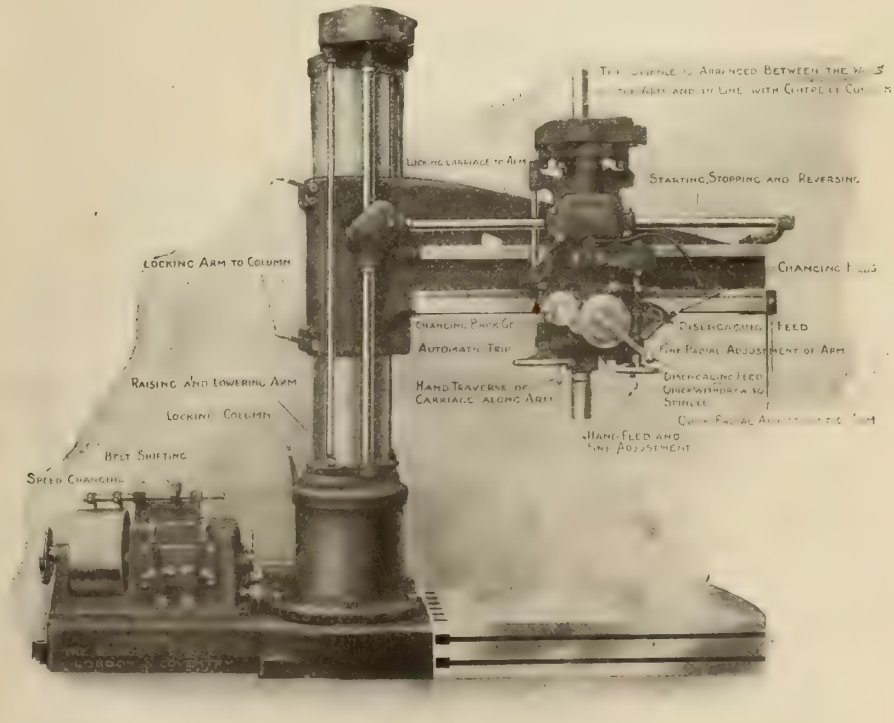
adapted for cutting face or barrel cams, also for the use of lubricant. The design follows closely their standard as used on the 24-inch and 36-inch sized machines. The spindle slide is very sensitive, running on large balls in steel tracks, while the drive is by universal joint from overhead counter. The rail-slide is accurately balanced and operated by rotary nut with ball thrust, giving a quick motion for the removal of cutter and former pin on the completion of the cam; the spindle slide being clamped in position while making the change, returning to a positive micrometer stop. All gears are protected, and the spindle bearings are of a style similar to those used in profilers. Provision is made for the instantaneous reversal of the feed, or the entire disengaging of same. The change from face to barrel cam fixture is also quickly made; the barrel cam fixture being shown on the floor in one of the illustrations and in place in the other.



12-INCH CAM CUTTING MACHINE.

12-INCH CAM CUTTING MACHINE.

equipped works at Coventry, are producing a number of machine tools which should prove of interest throughout the Dominion. One of the lines in which they have particularly specialized is shaping machines, which they make in seven sizes of a standard pattern, ranging from 10in. to 30in., together with two of a special type. The following advantages are claimed for this line:—

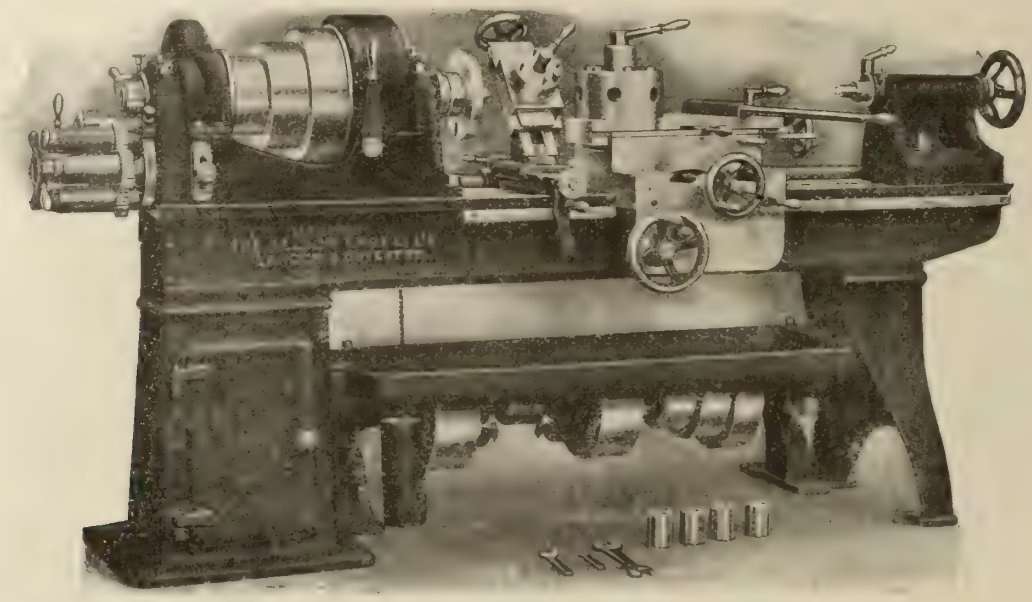


SELSON HIGH SPEED HEAVY DUTY SHAPER.

A WELL KNOWN LINE OF BRITISH MACHINE TOOLS.

THE Selson Engineering Co., of 85 Queen Victoria Street, London, England, who have modern and well-

1. The position of the ram is adjusted, by means of a rack and pinion, by a



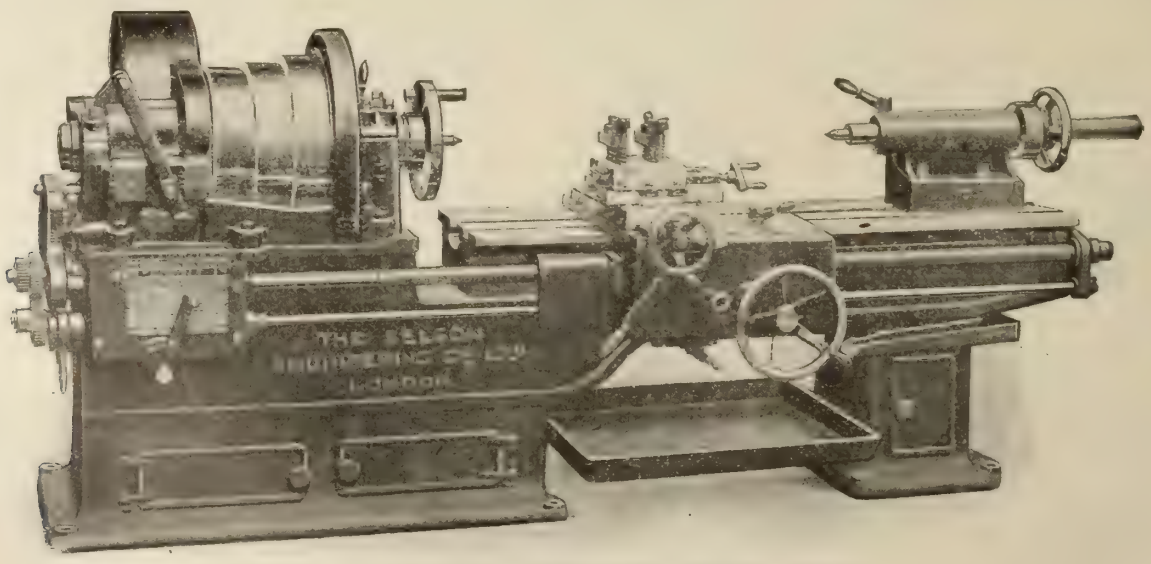
SELSON 6 FT. CENTRAL THRUST RADIAL DRILL.

hand wheel which is mounted on the same centre as the locking handle.

2. The ram is clamped to the crank by means of a serrated slide.

3. The main driving link is connected to the ram by a short link, thus imparting a draw stroke and a uniform cutting speed to the ram.

4. The index for the length of the stroke is mounted on a stationary index at the side of the machine immediately above the adjusting handle, so that the length of stroke can be set, either while the machine is in motion or while it is stationary, to any definite length.



SELSON PATENT BRASS FINISHERS' LATHE.

The special type shaping machines are designed specially for operating on large work, as the table can be swung aside on a pivot, and the work directly mounted on the lower table, an automatic cross feed being provided on the head. In other respects the construction is the same as the standard types and the shaper can be used with the automatic traverse to the table.

Radial Drills.

Another line which the Selson Engineering Co. have specialized in, is their radial drilling machines. These machines are that the centre line of the spindle being always in line with the centre of the column, no twisting strains are imposed on the arm, the thrust being taken up equally on each wall. The patent lies in the fact that a third bearing for the carriage is introduced on the top of the front wall, and takes the hanging weight of the saddle also the gear wheels on the top of the spindle for the back gears are taken from this bearing.

The machine is provided with an automatic stop and on the 6ft. machine a special arrangement is added for fine radial adjustments of the arm.

SELSON 17-INCH SWING HIGH SPEED ENGINE LATHE.

A patent feature on the machine is that for altering or reversing the feed, the whole of the feed motion can be stopped by depressing a lever and the alterations made while the machine is in motion. The index on which the alterations are made is stationary.

The special type shaping machines are designed specially for operating on large work, as the table can be swung aside on a pivot, and the work directly mounted on the lower table, an automatic cross feed being provided on the head. In other respects the construction is the same as the standard types and the are made in the Universal type with swivelling arm and swivelling saddle with 4ft. radius, and the new patent central thrust types, in the 4 ft. 6 in. and 6ft. sizes. The principal advantages claimed for these central thrust

The clutches for starting and reversing the spindle are arranged so that when the clutch is put in the bevel gears are driven round by a friction and when the speeds of the shaft and bevels are approximately the same, the

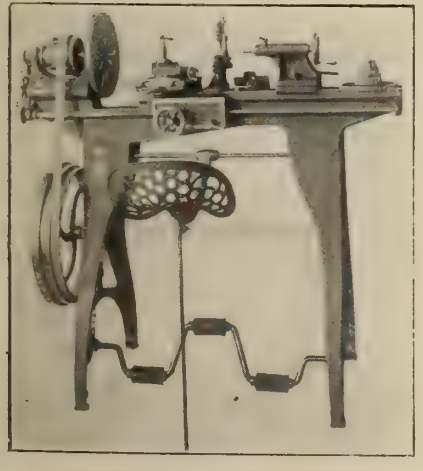
drive is taken up by a positive dog clutch.

Engine Lathes.

The high speed engine lathes manufactured by this Company are exceedingly powerfully built. They have a three stepped cone pelley, the largest step on the 17in. swing lathe, being 18in. diameter and the smallest 14 inches. The lathes are fitted with double back gears and two speed countershaft, 18 spindle speeds being thus obtained.

The end thrust on the lead screw is taken up on adjustable ball bearings. This is a great advantage when heavy threads are cut, as considerable friction is caused by the heavy thrusts on the end of the guide screw.

Monitor Lathe.



The Company also manufacture a patent brass finishers' lathe, which carries four hobs and chasers of different pitches, mounted on a turret. By simply revolving the turret four different threads may be cut. The chaser being also fitted with an auxiliary turret carrying four tools, internal threads of different pitches can be as readily cut.

BARNES NO. 5 GAP LATHE.

THE small gap lathe here shown is well suited for amateurs, jobbing shops and light work generally, and is a production of the W. F. & John Barnes Co., Rockford, Illinois. It is a screw cutting lathe, equipped with compound rest and off-set type of tail stock, permitting the compound rest to be set parallel with the bed. The head-stock boxes are accurately fitted to the spindle with provision for keeping them true and for taking up wear. Spindles of both head and tail stocks are of steel, with true taper holes for the reception of the centres; the tail stock centre is self discharging. The compound table has tee slots, and is thus adapted for clamping work for boring and milling operations.

All the mechanisms are securely protected from chips and dirt, thus insuring long wear and durability to the most vital parts of the lathe. The gearing furnished can be combined to make different leads of threads from 4 to 40, besides many others not mentioned on the index plate. All the gearing is cut from solid metal, and is as true and noiseless as it is possible for metal gearing to be.

This lathe swings 11 inches over the bed and 15 inches in the gap, which is 5 inches wide, measured from the face plate. The swing over the saddle is 6⅝ inches and the distance between centres 29 inches. The drive is by countershaft or foot-power, as desired. For the latter, either a velocipede or stand-up treadle can be supplied.

BARNES NO. 5 GAP LATHE.

TWO-SPINDLE DRILLING LATHE.

THE interesting two-spindle lathe here shown is a recent development of the F. E. Wells & Son Co., Greenfield, Mass. This lathe is a little out of the ordinary and would seem to give promise of considerably reduced drilling cost.

The construction is clearly seen from the cut. The purpose, of course, is the drilling or counterboring of two holes on opposite sides of a piece, or by the use of a suitable jig or fixture, one hole may be drilled in each of two separate pieces. It is not necessary that the two holes should be directly opposite one another, since in the machine illustrated, the right hand spindle is provided with six inches of cross traverse. The lathe is also built without this latter feature when desired.

TWO SPINDLE DRILLING LATHE.

Both spindles are brought forward by the foot treadle, coil springs pulling them back when the treadle is released. Draw-in collets are recommended for holding the twist drills, as the latter can then be ground down shorter than if held in an ordinary drill chuck.

The swing over the ways is 12 inches, and the distance between spindles is 16 inches. The spindles run in taper bronze ring oiling boxes and are 1⅝ in. in diameter by 3¼ in. long. The lathe is built with back gears when desired, in which case, a two-step cone pulley is provided in place of that shown in the illustration.

C.P.R. ANGUS SHOPS, MONTREAL.

THE Angus Shops of the Canadian Pacific Railway at Montreal had an immense output of rolling stock during 1912. It reached a total of 17,357 vehicles of every class. Included in this total were 248 passenger cars of all kinds; 16,693 freight cars; 119 snow plows, steam shovels, pile drivers, etc., and 297 locomotives.

Selected Market Quotations 128-129

"CANADIAN MACHINERY" A WEEKLY.

THE present number of Canadian Machinery marks its establishment on a weekly basis, and no more convincing evidence need be forthcoming of the steady development and successful enterprise relative to the production of mechanical equipment in Canada for general manufacturing and industrial purposes, than the demand from mechanical men, the Dominion over and beyond, for an increased and larger service than we have heretofore offered. Our journal has recently been increasingly recognized as not only the leading medium in the particular field of machine tool manufacture, foundry and general workshop practice, but has, in addition, been foremost in giving prominence to those supplemental contributories which determine efficiency of operation and consequent production economy. The foregoing references apply equally to the editorial and advertising sections of our Paper, each sharing the credit of accomplishing definite and highly satisfactory results from a gratifyingly large body of manufacturers, superintendents, foremen, draughtsmen and operative mechanics.

Weekly publication will naturally still further tend to increase the value of our Journal, for not only will each issue contain the usual attractive features of the monthly, but there will be found added selected and current market reports and clearly printed and displayed industrial developments and projects, calling for erection, equipment and installation.

THE BESSEMER CENTENARY.

THIS year witnesses the one hundredth anniversary of the birth of Henry Bessemer whose name will as assuredly be honored by posterity as are those of Watt, Stephenson and other great pioneers of engineering.

It is not too much to say that Bessemer's invention of the converter process of steel making has completely revolutionized modern life. Everyone now freely admits this, although at the time the discovery of the process was announced, there was not wanting the usual swarm of critics who freely decried the invention. Such, however, has been the history of all great discoveries. It is hard for us to put a true value on current events, we either under or over estimate their importance.

Our English contemporary, "Engineering," in the issue just to hand, has an interesting article on the life of Sir Henry Bessemer, from which we quote the following:—

Bessemer's work introduced an era of cheap production, without which our present conditions of existence would be impossible. The quickening of the pace, so noticeable of recent years, has been due to increased facilities of production, construction, and transport, all of which received an unprecedented impetus as a result of his work. It is difficult now to foresee any remaining direction in which a similar change could be brought about in the future; but on this point we do not propose to speculate. In several quarters at one time there might have been heard opinions unfavorable to Bessemer's work, but, in spite of such, it has played its part magnificently in the world's progress. We may also fall into the like error if we attempt to forecast the future of developments proceeding around us every day.

The era of steel, Bessemer's great bequest to mankind, has been put to such good purpose in the last forty or fifty years that the whole world has changed. Intercourse has increased; commerce has expanded, and incalculable benefits have followed in its train.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Owen Sound, Ont.—An extension is being added to the William Kennedy and Sons Foundry here.

Chatham, Ont.—An auto wheel factory, cost $40,000, is planned for the Chatham Auto Wheel Co.

London, Ont.—The G.T.R. lines at Windsor will be relaid with 100lb steel, the work to start in the Spring.

Windsor, Ont.—Fire did $6,000 damage to the Dominion Stamping Works, at Walkerville, Ont., on January 31.

Preston, Ont.—The Preston Car and Coach Co. will add four more shops to its plant, thus doubling its capacity.

Watrous, Sask. — The Farmer's Machine Co. will commence operations in their new factory as soon as power is supplied.

Transcona, Man.—The first engine has been taken into the G.T.P. shops, and two hundred mechanics have arrived from Rivers.

Winnipeg, Man.—A company here have made an offer to the Hercules Rotary Engine Co., Ltd., to manufacture their specialty.

Calgary, Alta.—The plant of the Western Iron Manufacturers, Ltd. went into operation, February 1. Thirty men are employed.

Saskatoon, Sask.—The Western Foundry & Machine Co. was gutted by fire recently, the loss of $25,000 being covered by insurance.

Orillia, Ont.—The works of the Canada Refining and Smelting Co., which were partially destroyed by fire recently, will be rebuilt without delay.

Sarnia, Ont.—An extension to their stove factory on Wellington and Vidal Streets, by the Doherty Mfg. Co., 157 Vidal Street South, is planned.

Belleville, Ont.—The manufacture of steel will be commenced here by the Twain Electric Steel Co. The company have secured mines in Hastings County.

Dunville, Ont.—The Canadian Engines Co. is having plans drawn for a large addition to be made to its plant for the manufacture of gas and gasoline engines.

Brandon, Man.—The Brandon Wire and Stamp Co., organized by eastern capitalists for the manufacture and distribution of metal goods, is about to start operations.

Pembroke, Ont.—The Alexander Barr Co., Pembroke, Ont., will need new equipment for their factory which was burned recently. Several new forges will be installed.

Fort William, Ont.—The first two car loads of structural steel for the construction of the Canadian Car and Foundry Co.'s plant, arrived on Thursday, January 18.

Edmonton, Alta.—Austin J. Bruff, a representative of the Union Metallic Cartridge Co., Bridgeport, Conn., has announced that his firm will establish a branch factory here.

Strathroy, Ont.—The Royal Motor Co. will build their new plant at Strathroy, Ont., early in the spring. They will employ about 300 men and Mr. J. G. Dunn is the president.

Sydney, N.S.—The Sydney Foundry and Machine Co., Ltd., Sydney, N.S. contemplate installing new forging equipment, traveling crane and latest type of casting machinery.

New Westminster, B.C.—Preparations are being made on Lulu Island, to build a new plant for the Heaps Engineering Works. Piles are being driven for the machine shop and other buildings.

Guelph, Ont.—The International Sand, Lime, Brick and Machinery Co., of Montreal, will start at once to build a plant at Guelph, Ont., costing $90,000, employing 50 men to begin with.

Vancouver, B.C.—Contracts have been awarded exceeding $1,200,000 for machinery, plant and structural steel in connection with the smelter to be erected at Granby Bay, Portland Canal district.

Montreal, Que.—Twenty-five heavy Mikado type locomotives recently ordered by the Grand Trunk Railway from the Montreal Locomotive Works, Ltd., will be equipped with vanadium steel frames.

Sydney, N.S.—The Cape Breton Electric Co., Sydney, N.S., will spend $200,000 on new equipment, including for a machine shop, also on railway motors, new telephone system and a ferry boat.

London, Ont.—The Guelph Tool Company, T. S. Hobbs, manager, have secured a site here, upon which they will erect a factory for the manufacture of tools and hardware specialties. Estimated cost, $50,000

London, Ont.—Chisholm Dunn Telephone Appliances, London, Ont., contemplate the purchase of machinery and equipment required for manufacturing telephone receivers, transmitters, etc., also stock required in the manufacture of brass and nickel goods, etc.

St. John, N.B.—T. McAvity & Sons are prepared to erect a group of 30 buildings and give employment to a thousand workers in the iron and brass industries when the city has its new industrial area ready for locating upon.

Montreal, Que.—The Dominion Steel Corporation has ordered additional machinery to increase the capacity of its wire and nail plant, which has been recently put on double turn. This will give at once an output of over 2,000 kegs daily and ultimately provide an outlet for the whole of the product of the wire rod mills.

Hespeler, Ont.—Hespeler is to have a new industry this spring. A company has been formed, at the head of which is Hon. Geo. A. Clare, M.P., of Preston, and other Waterloo and Toronto capitalists, to manufacture galvanized iron and steel household wares. The new factory will use the old woollen mills buildings, which ten years ago, ceased operations on account of an unfavorable tariff.

Shippegan, N.B.—Tenders for the purchase of the reduction works plant and property at Shippegan, N.B., will be received until noon of February 12th, 1913, at the office of A. Johnston, Deputy Minister of Marine and Fisheries, Ottawa. The plant consists of an office building, reduction works proper, warehouse and forge. Plant is equipped with a boiler, engine, feed water heater, boiler feed plmp, fire protection and general service pump, fish drier, and all the necessary fittings in connection with same.

Victoria, B.C.—Tenders will be received up to noon of Saturday, February 15th, 1913, for the purchase of the engines and boilers with fittings at pumping stations No. 1 and No. 2 Matsqui. The plant at each station consists of one 16-in. by 36-in. Hamilton Corliss engine, one Babcox and Wilcox water tube boiler about 180 h.p., one duplex boiler feed pump, one separator, one jet condenser, etc. Full particulars may be had on application to Mr. D. McCaskill, caretaker, residing on dyke near pumping station No. 1, or E. A. Wilmot, Inspector of Dykes, office of Inspector of Dykes, Victoria.

Municipal

Summerside, P.E.I.—A steel bridge was opened on Friday, Jan. 10, at Montagne.

St. Catharines, Ont.—The C.N.R. will build into this city, and will erect a high-level vehicular bridge across the old canal.

Sydney, N.S.—Owing to last year's disastrous drought the capacity of the water works plant must be increased to connect other lakes with the present supply, a pipe line and pumping station will be required.

Prince Albert, Sask.—The council have agreed to make a temporary loan of $400,000 in order that the development work on the civic power plant at Lacelle Falls, on the Saskatchewan River may be proceeded with.

Saskatoon, Sask.—By-laws to issue $150,000 for electric light extensions; $20,000 for fireproofing pumping station; $50,000 for fire equipment, and $70,000 for the purchase of an incinerator, will be voted on this month.

Calgary, Alta.—The city commissioners intend recommending to the city council that the sum of $11,100 be spent on the purchase of a pump to be installed at the intake on the Bow River.

Toronto, Ont.—The Board of Control have recommended to the city council that the tender of the Turbine Equipment Company, of New York City, for a 15,000,000 gallon pump for the Waterworks System, be accepted. The tender price was $44,000.

Electrical

Ottawa, Ont.—The Ottawa Electric Railway will extend its lines in the spring. Twenty new cars will also be required.

Assiniboia, Man.—This municipality is planning to install an electric light plant this year. The secretary is Frank Ness, Kirkfield Park, Man.

St. John, N.B.—The New Brunswick Hydro-Electric Co., will, during the year make a large expenditure in connection with its project to provide another source of light, heat and power.

Hamilton, Ont.—The Dominion Power Transmission Co. is considering the purchase of twelve double-truck cars for use on the Hamilton Street Railway.

Winnipeg, Man.—A 9,000 k.w. 3 phase step-up transformer is required at Point du Bois power house. Tenders to Chairman of Board of Control before Feb. 14.

Welland, Ont.—The town council have authorized the purchase of the Ontario power plant, and will use it in connection with the Hydro-Electric System. The price is $26,350.

Orillia, Ont.—The town intends to sell its power dam to the Dominion Government for about $100,000. With the money a new power plant will be built, capable of supplying four thousand horse power.

Sault Ste. Marie.—The H. E. Talbot Company, of the Soo, have been awarded the contract for the construction of a 1,500-foot dam and the installation of a complete hydro-electric system at Grand Mere, Que.

Thornsbury, Ont.—The Forbes Bros., of Seaforth, Ontario, have the contract for the erection of poles and installing telephones for the Beaver Valley Municipal Telephone System. They commenced operations last week.

St. Catharines, Ont.—The city council have received a quotation from the Hydro-Electric Commission of $14 per horsepower for 2,000 horsepower, the city to install a transformer station and system, estimated to cost $15,000.

Brandon, Man.—The city council have awarded the contract for machinery for the power plant in connection with the street railway system to the highest of the three tenders sent in—that of the Canadian General Electric Co. for $15,750.

St. Thomas, Ont.—Surveyors for the new Hydro-Electric power line from this city to Windsor, started work on the St. Thomas end on Thursday, Jan. 2. The line will run through Dutton, West Lorne, Rodney, Ridgetown, Chatham and Kingsville.

Estevan, Sask.—A company capitalized at $2,500,000 will buy coal land near here, and will generate power from engines using coal gas. Machinery will be required this summer. Mr. Geo. D. Casson, publicity commissioner, Estevan, is handling the matter.

Port Alberni, B.C.—Messrs. Quinn & Rowley, of this city, have been given the contract to install the lighting system in Port Alberni, the price being $10,000.

Prince Albert, Sask.—The commissioners of this city were authorized to purchase two new 300 h.p. Babcock and Wilcox boilers and a new turbine exciter for the enlargement of the present power plant. Preliminary steps were taken towards the erection of a larger power house in another portion of the city.

Saskatoon, Sask.—The Saskatoon Electric Railway have been asked by the town of Sutherland, about two miles from here, to extend its line there. Sutherland is also considering the installation of an electric light and power plant to be owned and operated by the municipality.

General Industrial

Vancouver, B.C.—The American Can Co. have taken over the Cliff Canning Co. of East Burnaby, and will move their plant to this city. The latter company sold their machinery, stock-in-trade and good-will for $200,000.

Moose Jaw, Sask.—The Western Canadian Brush Mfg. Co. has arranged for a factory site here.

Maisonneuve, Que.—A shoe factory is contemplated for the Smarton Shoe Co. of Quebec, 245 ft. by 230 ft.

Calgary, Alta.—The Burns Packing Co. will erect a new factory to replace that destroyed by fire recently.

South Vancouver, B.C.—Two incinerators, costing $60,000, have been recommended by the health committee.

St. Catharines, Ont.—W. J. Brigger, of Hamilton, has been granted partial exemption for a $45,000 jam factory.

London, Ont.—An Aurora, Illinois, concern has bought out the Chelsea Green Hardware Co., and will operate here.

Fort Frances, Ont.—R. Bruce & Son are preparing to make some additions to the firm's tie-cutting plant at this point.

Sydney, W.S.—The Cross Fertilizer Co., Ltd., Sydney, N.S., will spend $80,000 on an extension and machinery this year.

St. John, N.B.—The Edward Partington Pulp and Paper Co. will increase the capacity of its pulp mill by 50 per cent.

Toronto, Ont.—The Hinde & Dauch Paper Co. are putting up a four-storey brick and steel factory here, to cost $80,000.

Prince Albert, Sask.—A creamery will be erected here. J. F. Hansen has approached the Board of Trade with the proposition.

Edmonton, Alta.—The City Commissioners have decided to spend $50,000 or $60,000 upon machinery for a street paving plant.

Prince Rupert, B.C.—The Cold Storage Company will erect a fertilizing plant this spring, and possibly a fish canning factory.

Dundas, Ont.—The Wentworth Orchard Co., of which Dr. A. C. Caldwell is president, will erect a jam factory at Waterdown, Ont.

Kingston, Ont.—The American Creosote Paving Co. will build a plant here, if the harbor is dredged to allow their shipping to come in.

Edmonton, Alta.—The Acme Brick Co., operating a plant six miles west of Edmonton, Alta., will spend $250,000 on additional equipment.

Berlin, Ont.—S. A. Brubacher, of this city, will manufacture motor washing machines, for which purpose a good-sized shop has been erected.

Toronto, Ont.—The Dominion District Steam Heating Co. asked the controllers recently for a franchise to supply steam through an underground system.

Red Deer, Alta.—The Great West Lumber Co., Ltd., are preparing to add considerable machinery to their mill

here. This will include a lathe mill, a resaw and a new boiler.

Fort William, Ont.—The Board of Trade will consider a proposition, with much capital behind it, for the installation of a gas plant in this city.

Fort William, Ont.—An extension to their elevator is planned by the Western Terminal Elevator Co. Capacity to be increased by 1,000,000 bushels.

Lethbridge, Alta.—A broom factory is to be added to the jail the Provincial Government maintains here, and machinery is to be put in at once.

Winnipeg, Man.—The H. B. Reinforced Brick Work Co. will establish a factory at Winnipeg in the near future. Sten Lund, of Winnipeg, is president.

Burlington, Ont.—A fire in the boiler room is supposed to have been the start of a big blaze which completely destroyed the basket factory of J. W. Dalton on January 26th.

Blenheim, Ont.—A canning factory, cost $40,000, on Talbot Street, is planned for the British Canadian Canners, Ltd.; manager, John Wall, 34 James Street, N. Hamilton.

Calgary, Alta.—The B. B. Rich Cut Glass Mfg. Co. is preparing to establish here a factory that will employ about fifty men to start with. The president of the concern is R. T. Brooks, of Philadelphia.

St. Catharines, Ont.—The B. F. Goodrich Co. of Akron, Ohio, will establish a Canadian branch here, to employ a thousand hands. The city has given 17 acres of land, fixed assessment of $10,000 for ten years, and the privilege of taking water from the canal.

Montreal, Que.—The St. Lawrence Pulp and Lumber Corporation, with a capitalization of $4,000,000, will establish a $2,000,000 pulp and paper plant in Quebec province. The offices will be at New Carlisle, Bonaventure County, and its limits at Grosse Pabos, Gaspe Peninsula.

Walkerton, Ont.—The Canada Saddlery Hardware Co. have asked the Town Council to submit a by-law to the ratepayers of the town granting them a loan of $10,000. This company was established about six months ago, and the $10,000 capital stock subscribed for was expended in putting the factory in running order.

Gananoque, Ont.—Plans are being prepared by Cowan & Britton, Ltd., Gananoque, for enlarging their plant to three times the present size, for the manufacturing of all descriptions of builders' hardware, specializing tee and strap hinges and butts of all kinds. The building of the new plant will begin in the spring. Presses for stamping butts and hinges and other hinge and butt machinery will be purchased.

Saw and Planing Mills

Battleford, Sask.—The Galvin Lumber Works, Ltd., will establish a branch here.

St. John, N.B.—Haley Bros. & Co., have applied for a site upon which to erect a woodworking plant.

Fort William, Ont.—Fire did a thousand dollars damage to the C.P.R. carpenter shop on Monday, Jan. 13.

Regina, Sask.—J. A. Menzies, will erect a sawmill at Merritt in the spring. He will purchase a new boiler and engine, and some other machinery.

Calgary, Alta.—The wood-working plant of the J. M. Bateson Co. was reduced to ashes on Sunday, Jan. 19. The loss was $60,000, including $30,000 worth of fixtures for the new Hudson Bay store.. The plant will be rebuilt.

Building Notes

London, Ont.—The International Harvester Co. will build a large warehouse here.

Nanaimo, B.C.—The Nanaimo Amusement Co., Ltd., will build a handsome theatre here.

Toronto, Ont.—The Shea Syndicate will build a new vaudeville house to seat 3,000 people.

Saskatoon, Sask.—The Calgary Brewing Co. will, it is rumored, build a plant here in the spring.

Winnipeg, Man.—Plans for 200 additional rooms to the Royal Alexandra Hotel have been completed.

Weyburn, Sask.—The Weyburn Club will be incorporated shortly, and premises costing $25,000 erected.

Ottawa, Ont.—Tenders for the new Customs House will be called for shortly. Excavating is now going on.

Hamilton, Ont.—It is rumored that the C.P.R. will spend a million and a half dollars on an office building here.

Vancouver, B.C.—Mr W. G. Elliott will erect a $30,000 apartment house at the corner of Sixth Ave. and Alberta St.

Toronto, Ont.—The Temple Pattison Co., makers of dental supplies, will erect a five-storey warehouse at 243 College Street.

Vancouver, B.C.—The Standard Trust & Industrial Co. will build a four-storey reinforced concrete building costing $45,000.

Victoria, B.C.—Sealed tenders have been invited for the construction of the new jail. Bids were received up to January 28.

Saskatoon, Sask.—The contract for the three-storey Ash-McGowan building has been awarded to the George H. Archibald Co.

Victoria, B.C.—Permits for two apartment blocks have been taken out by Parfitt Bros. Sums of $11,000 and $40,000 are to be spent on them.

Ottawa, Ont.—Tenders for Montreal Postal Station "H" will be received at the Department of Public Works until Monday, February 10.

Toronto, Ont.—Messrs Teagle & Son secured the contract for the masonry work on the new Keele St. public school. Their price was $38,800.

Victoria, B.C.—The Victoria Warehouse Co., Ltd., took out a building permit recently to construct an addition to warehouses costing $8,000.

Toronto, Ont.—The Methodist Book Room board will erect a $1,000,000 building on the site at the south-east corner of Queen and John Streets.

Prince Albert, Sask.—It is stated that the Canadian Northern Railway will erect a large hotel here, at a cost of between $250,000 and $500,000.

Winnipeg, Man.—It has not yet been decided whether the grain elevator at McLean, Sask., which was burned down on Tuesday, Jan. 21, will be rebuilt.

Toronto, Ont.—The A. B. Ormsby Co. have amended plans for their proposed new factory for manufacturing metal window sashes. It will be 50 feet high.

Toronto, Ont.—Messrs Hyman, Simon and Henry Franklin have bought land in Toronto, and will build a five-storey warehouse on the Queen and Portland St. corner.

Winnipeg, Man.—Tenders are being called for a new factory building for the Smart-Woods, Ltd., bag manufacturers. It will be five storeys and basement, and 147x98 feet.

Vegreville, Man.—A large building will be erected here to accommodate stores, opera house, offices and moving picture show. It will be 60x100 feet, costing $25,000.

Vancouver, B.C.—The Canadian Brewing Co. have awarded the contract for the erection at a cost of $70.000 of a four-storey brick and steel addition to their premises on Yew Street.

Berlin, Ont.—It is proposed by the Government to erect a new Federal Building at an estimated cost of $200,000. The present post office will be used as a customs and excise office.

Toronto, Ont.—Thirty-two tenders were received for the construction of the Technical School, but only the five lowest wanted the contract for the entire work. The lowest tender was $1,219,000—$400,000 more than the appropriation.

Toronto, Ont.—The Canadian Bank of Commerce has acquired, or is about to acquire, the Manning Estate, on which the McConkey Restaurant stands, and will erect a new building. Darling & Pearson are their architects.

McLeod, Alta.—The first building permit this year was given to the Calgary

Brewing Co. for a large cold storage warehouse on N. Fourteenth St. It will measure 34 x 34 feet, with a big basement, and a complete refrigerating plant.

Montreal, P.Q.—Mr. Alphonse Piche has been instructed to proceed with the plans for the erection of a post office at Westmount. Its approximate cost will be $75,000. He is also completing the plans for the new fire and police station for Longue Pointe Ward. Tenders are being called for by the Postmaster-General of Canada for the construction of the big post office at the corner of St. Catherine and Bishop Streets. It will be four storeys high, of classic design, and cost about $300,000. The frontage will be 77 feet, and the depth 120 feet.

New Incorporations

Ottawa, Ont.—The Toronto Structural Steel Company, Limited, have been incorporated with a capital stock of a million dollars.

Ottawa, Ont.—Letters patent have been issued incorporating "Ocean Freight Line, Limited," of Toronto, with $100,000 capital. The company is authorized to build or buy and operate ships.

Toronto, Ont.—Streetsville Brick Co., Ltd., capitalized at $100,000, has been incorporated. Provisional directors: Edgar Vandewater, real estate agent; Frederick Longwell, manufacturer; and John Drummond, builder.

Peterborough, Ont.—The partnership between Peter H. Spies, Geo. F. Schneider, F. S. Schneider, S. E. Risher under the name of The Peterborough Engineering and Constructing Co., has been dissolved by mutual consent. Peter H. F. Spies will continue the business.

Joliette, Que.—The Joliette Steel Casting Works has been incorporated with a capital stock of $2,000,000. The incorporators are George A. Delisle, manufacturer; John Lawrence McDonald, contractor; A. Carle, accountant, and John B. Duclos, all of the town of Joliette, Que.

Winnipeg, Man. — The Strong-Scott Manufacturing Co., manufacturers of flour milling machinery, has been incorporated with a capital of $150,000. The firm's headquarters are at Minneapolis, and their Winnipeg plant at 774 Dufferin Ave. Mr. A. W. Strong is the president.

Port Arthur, Ont.—Diamond Brewery Company, Limited, capitalized at $100,000, has been incorporated. Provisional directors are: Allen Alphonse John Guerard, manager; Alexander George Guerard, farmer; Peter Wilfrid Whalen, conductor; Austin Dunn, gentleman, and Hugh Keefer, barrister-at-law, all of Port Arthur.

Montreal, Que.—The Grenier-Warrington Motor Car Co., Ltd., has been incorporated at Ottawa with $50,000 capital to manufacture and deal in automobiles, motor cars, motor boats, etc. Dr. E. Ostigny, Theopile Viau, John T. Warrington and Aime Grenier, of Montreal, and Hector Paiment, of Outremont, Que., are the incorporators.

Winnipeg, Man. — Frank Ruwecke, Frank Leitner, Ephraim R. Chapman, Carl Wilhelm Mentzendorff, and S. Hart Green, all of Winnipeg have incorporated under the name of the Roehrig & Koehig Machinery Company, for the purpose of carrying on business as engineers. The new firm is capitalized at $100,000, and will have headquarters in Winnipeg.

Toronto, Ont.—Legal and Financial Corporation, Limited, capitalized at $500,000, has been incorporated. The company will erect a 12-storey office building. The Provisional directors of the company are: Augustine Joseph Gough, Alexander John Russell Snow, K.C., James Edward Murphy, Alexander Stephen Butchart, Henry Hampton Pirie, Frederick Gordon Dyke, and Daniel Webster Lang.

Winnipeg, Man. — William Frank, Thomas Foster Shannon, Sampson Leslie Head, John Robert Little, and Ernest Angus Fletcher, all of Winnipeg, have incorporated under the name of the Lake Winnipeg Brick & Lumber Company, Limited, for the purpose of carrying on a business of manufacturing brick and timber merchants. The new firm is capitalized at $200,000, and will have headquarters at Winnipeg.

Montreal, Que.—Griffiths and Co., Ltd., have been organized at Ottawa with a capitalization of $2,500,000. The company is incorporated with the object of carrying on the business of general contracting, construction and development work, and of electrical, civil, hydraulic and harbor engineering, etc. The chief place of business is Montreal. Amongst the names of the corporators is that of Philip Risdale Warren, chief engineer of the Norton Griffiths Co., Ltd.

Walkerville, Ont.—Plans are being made for a two-storey factory, for the Tate Electric, Ltd., a motor car company organized by Toronto and Montreal capitalists. The directors are Henry and N. A. Timmins, W. Scott Hutchinson, C. E. Archibold and S. Carsley, of Montreal; D. A. Dunlap and A. O. Tate, of Toronto, and Albert Kaltschmire, of Detroit, factory and production manager. The general offices will be at Walkerville, with executive offices in Montreal.

Personal

City Engineer Wilson, of Fort William, Ont., recently sent in his resignation, which was accepted at a meeting of the Council on Friday, January 21.

John F. Curry, who for twenty-four years has been an important official of the Canada Car and Foundry Company, at Amherst, N.S., has lately been appointed to the sales department of that concern.

Mr. George G. Powell, of Toronto, has been promoted from principal assistant city engineer to deputy city engineer, and his salary advanced from $2,700 to $4,000. He turned down an offer to go to Prince Albert, Sask., as Works Commissioner, for $6,000 a year.

Obituary

James Scott, 35 years of age, chief engineer of the Winnipeg waterworks department, died of scarlet fever on Thursday, January 23.

John Patterson, of Hamilton, Ont., died at his home on Sunday, January 26. He had been a sufferer from Bright's disease for years, and this caused his death. He was one of the first men to realize the possibilities which Hamilton offered for electrical development, and although his efforts did not always meet with success, he has several big schemes to his credit. He died on the eve of the completion of plans for the Hamilton, Waterloo and Guelph Railway—his pet scheme. Among his most important achievements was the formation, in 1896, of the Cataract Power Company, which transmits power from Decew Falls to Hamilton.

Geo. S. Smith, general superintendent at Montreal of the Canadian Steel Foundries, Ltd., died suddenly of heart disease at his apartments in the Windsor Hotel, Montreal, January 30. He had been connected with the above interests since 1889, and although troubled with his heart during the past two years, was able to be down at the office of the company, in the Transportation Building, on the Monday previous, but since that time his condition became gradually worse. Mr. Smith was born in Montreal forty-eight years ago. He was educated at the Montreal High School, following which he served his apprenticeship in the mechanical department of the C. P. R., being associated at that time with Mr. K. W. Blackwell, into whose service he later entered. Following his apprenticeship, Mr. Smith entered the office under Mr. F. H. F. Browne, who was at that time mechanical superintendent. In 1889 he went to the Canada Switch Co. as superintendent, this concern being later known as the Canada Switch and Spring

Co. Later, the name of the firm was changed to the Montreal Steel Works, and a few years ago it was purchased by the interests of the Canadian Steel Foundries, Limited, the present title of the company, of which business Mr. Smith was general superintendent. His duties embraced the supervision and administration of the foundries in Point St. Charles, Longue Pointe, and at Welland, Ont. Throughout his long business career Mr. Smith had been associated with Mr. K. W. Blackwell, who, after severing his connection with the C. P. R., started the first concern with which Mr. Smith commenced as superintendent.

Catalogues

The Whitman & Barnes Mfg. Co., St. Catharines, Ont., have sent us an attractive folder, in which the picture of a drill holds the folder closed for mailing. It contains an argument in favor of "W. & B" drills.

W. S. Rockwell Co., New York, have sent us a copy of Catalogue No. 44, on the subject of Rockwell Tilting Crucible Melting Furnaces. It consists of two pages, yet therein, by excellent drawings and photographs, accompanied by terse reading matter, the whole system of melting non-ferrous metals is laid bare. A careful study of these two pages gives one a clear idea of what the Rockwell Furnaces consists, and how it is operated. The catalogue is a model of condensation.

Industrial Works, Bay City, Mich., have favored us with a copy of their latest catalogue of locomotive cranes, the same being a most artistic and attractive production. The book is a collection of large size photo-illustrations of 42 industrial works locomotive cranes supplied to the United States Steel Corporation, by whom they were used in the construction of their enormous steel plants at Gary, Ind., and South Chicago, Ill. An early illustration is entitled "The Beginning of Things," and shows one of the cranes breaking ground for the foundations of one of the buildings. Successive pictures show other cranes setting concrete, erecting the steel work, etc., the progress of the work being readily followed. The illustrations are really excellent examples of half-tone work and can hardly be distinguished from photogravures. Altogether the booklet is a credit to everyone concerned in its production.

The Eugene Dietzgen Co., Chicago, manufacturers of drawing materials and surveying instruments, have issued the ninth edition of their very complete catalogue. Some idea of the size of it will be gathered from the fact that it contains over 550 pages. It is bound in cloth cover. This firm carries everything required in the drawing office, from ink to drawing tables. Their stock seems to be complete. The last portion of the catalogue is devoted to surveying instruments and accessories. They have an office in Toronto, which has been opened since their last catalogue was issued. Their goods may also be obtained in Chicago, New York, San Francisco, New Orleans and Pittsburg.

Wanderer Milling Machines are fully described in an attractive catalogue forwarded to us by the Wanderer Works, Ltd., Schoenau, near Chemnitz, Germany. These millers are made in all types—plain, universal and vertical and are of thoroughly modern design and construction. The plain and universal types are built with cone drive and geared feeds, or with a single pulley constant speed drive and automatic longitudinal and transverse feeds. The latter type can also be supplied with an electric drive when required. On such machines the motor is carried by a cast knee solidly clamped to the column of the machine. Power is transmitted from motor to spindle by two double helical spur wheels. In this way the space occupied by the machine is considerably reduced and a smooth drive is secured, enabling accurate work to be turned out.

These machines are thoroughly well designed and constructed, and seem to follow closely along the same lines as the best American millers.

The Standard Electric Tool Co., Cincinnati, Ohio, in Bulletin V 7, issued on the first of the year, take considerable pains to show that their "Standard" high-power universal portable electric drills are the best; that they will run off any lamp socket or power circuit, both alternating and direct current of the same voltage, and will operate satisfactorily on low frequency circuits, such as 25 and 40 cycles; further, that they do not race when running light; and that consequently the drill points are not burned. The firm guarantees to make good by repair or replacement any part of their product which proves defective within a year from date of shipment.

AGENTS WANTED

MESSRS. ROYCE, LIMITED, ELECTRICAL and Mechanical Engineers, Trafford Park, Manchester, England, wish to communicate with a firm of constructional engineers in Canada who wrote them during 1912 offering their services as agents, and will be obliged if the firm in question will respond to this advertisement. Weekly Market Letter

THERE is no diminution in the consumption of iron and steel, either in this country or the United States. There is, however, less new buying, both of finished material and of pig iron, but this is accounted for by the fact that practically all large buyers are well covered for forward delivery for some time ahead, and have heavy orders on the steel companies' books for spring and summer delivery.

New projects requiring steel, such as is required for building and bridge work continue to loom up every week.

There is little change in prices, the move being upwards if any. Open hearth billets are offered in Pittsburg this week at $30.00, which is $10 a ton advance on the price this month last year. There is some quietness and weakness in the pig iron market.

The local representative of the United States Steel Corporation informs Canadian Machinery that the proposed plant at Sandwich is an assured fact; that construction work will start there in the spring, and that they will probably be making steel there in two years.

Mr. Chas. M. Schwab, president of the Bethlehem Steel Co., has denied the report that he is connected with a reported consolidation of a number of independent steel companies of the United States and Canada.

Screws.—Orders for screws, nuts and bolts are coming in freely, with no falling off. This, however, is not a good time of the year for this trade. Stock-taking is only just over, and manufacturers are coming across stocks which require using up. Business should be very brisk in May.

Nails and Wire.—There is a big demand for wire from the trade in general, particularly oil annealed and galvanized. Nails are strong, the demand for this product being very consistent. Track fastenings are selling well.

Coke.—Owing to the exceedingly high pitch at which industries are being worked just now, all high grades of coke are scarce, and prices are stiff. Cars are scarce too, which makes it difficult for manufacturers to secure a prompt and good supply. The price of Solvay coke, which is generally used in this part of the Dominion, remains unchanged, though Connellsville coke has taken a jump of fifty cents a ton.

Old Material.—The market in old material is weak and featureless, and prices are not now what they have been for some weeks past. People who bought scrap when prices were high are not anxious to sell, and are holding until a jump occurs again.

"CANADIAN MACHINERY"
A Weekly

¶ With this issue, "Canadian Machinery" becomes a weekly, and every subscriber will receive it four times a month, instead of monthly as in the past—you will get a copy *next week,* not next month.

¶ Subscribers in Ontario and Quebec should get their copies every Thursday. Delivery at more distant points will be later, according to distance from centre of distribution.

¶ Developments and changes in various lines of machinery manufacturing, shop management, shop practice, etc., have been so rapid during the last few years, that a weekly publication has become necessary in order to keep our readers fully informed along these lines. The usual mechanical features for plant superintendents, foremen, draftsmen, etc., will be continued in each weekly issue.

¶ Manufacturers who are interested in effecting economies in their plants, will do well to watch each issue closely for articles pointing the way to savings by suggestions to be obtained from articles on cost systems, efficiency, etc.

¶ Manufacturers having engineering product to dispose of will find in our "Industrial News" dept. many items which will be new to them, and every effort wil be made to have this dept. give a complete and reliable record of developments which may mean the purchasing of any class of engineering equipment.

¶ An entirely new feature in "Canadian Machinery" is our market reports on Iron and Steel, Metals, etc. While this department is not as complete in this issue as we would like to have it, those interested will find many items of information. Future issues will show a steady development in this particular feature.

To Advertisers

¶ By changing our journal from a monthly to a weekly publication, we are greatly extending our field of usefulness among our readers as outlined briefly above.

¶ Mechanical men, purchasing agents, and manufacturers will all find news and mechanical articles of vital interest to them in each issue, and by receiving their copy regularly each Thursday, will unconsciously set aside a definite time for looking over the latest issue.

¶ Our weekly issues offer an unprecedented opportunity for advertising to a large list of the best manufacturers, plant superintendents, and purchasing agents in every province of Canada. The frequency of issue, combined with strong appealing copy, will make an impression on buyers that cannot be denied.

¶ Every advertisement in this issue is run under contract and paid for at our regular card rates, and each number will show a steady increase of advertising carried.

¶ A line will bring full particulars, or we will arrange to have our representative see you at an early date.

THE PUBLISHERS

CANADIAN MACHINERY BUYERS' DIRECTORY

To Our Readers—Use this directory when seeking to buy any machinery or power equipment. You will often get information that will save you money.

To Our Advertisers—Send in your name for insertion under the heading of the lines you make or sell.

To Non-Advertisers—A rate of $5 per line a year is charged non-advertisers.

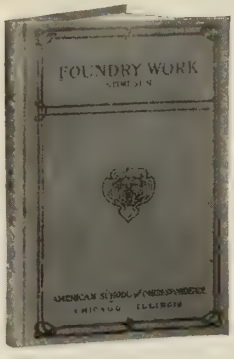
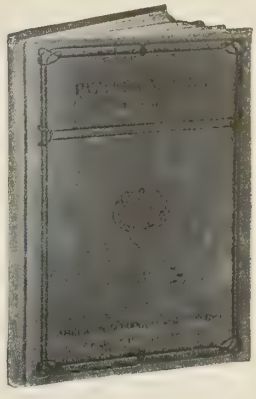
Mechanical Engineering Books



If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.



MACHINE-SHOP WORK. By Frederick W. Turner, Instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price ...$1.50

MECHANICAL DRAWING. By Ervin Kenison, S.B., Assistant Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price $1.00

FOUNDRY WORK. By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 142 illus. Cloth binding. A practical guide to modern methods of moulding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price $1.00

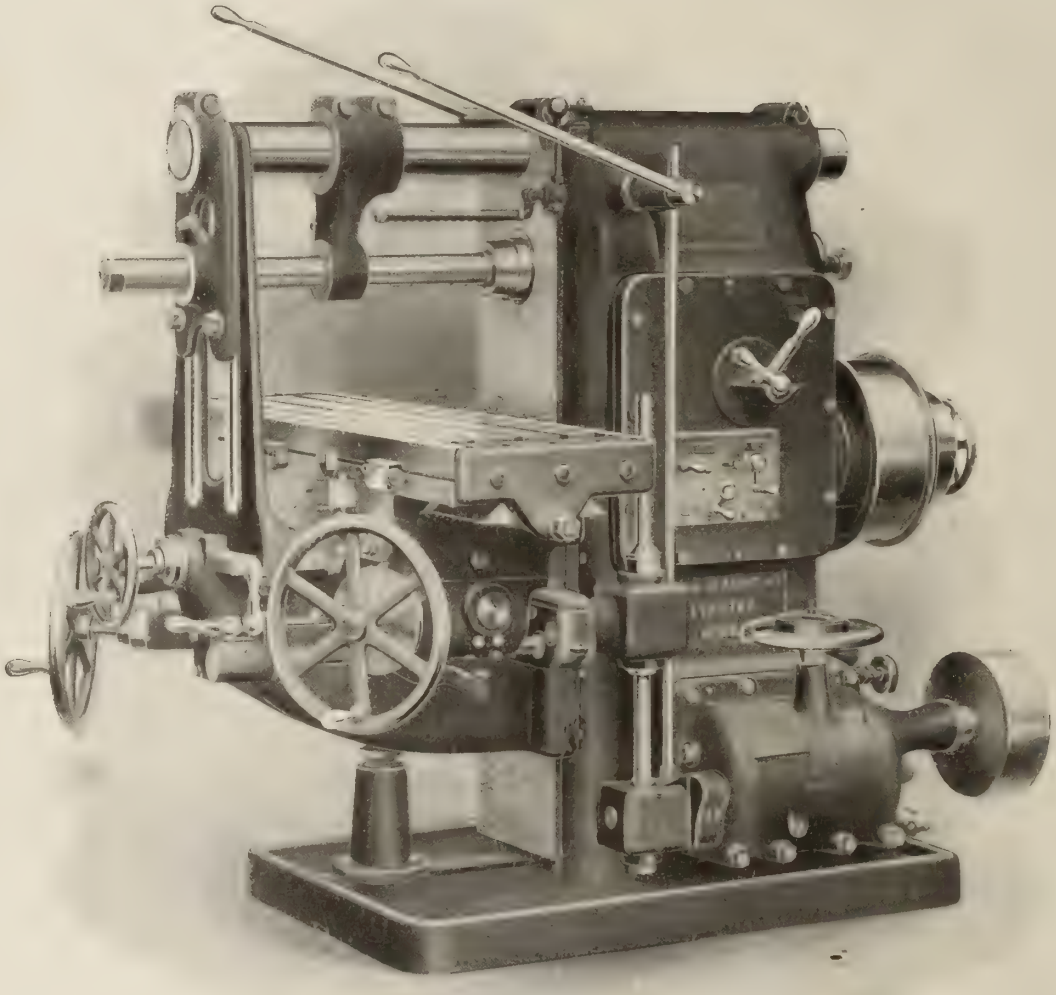
PATTERN MAKING. By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price $1.00

MACHINE DESIGN. By Charles L. Griffin, S.B., Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price $1.50

FORGING. By John Lord Bacon, Eng. and Supt. of Construction, with R. P. Shields & Son, San Diego, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working handbook of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price $1.00

TOOL MAKING. By Edward R. Markham, Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers, Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels (annealing, tempering, spring tempering, hardening, case-hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandrels, taps, hobs, reamer and tap-holders, jigs, gauges, dies and die-holders of all kinds, counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price $1.50

Sent postpaid on receipt of price. We can also furnish you with other standard works on Engineering in all its branches, including books for Civil Engineers, Contractors, Electricians, Foundrymen, Steam Engineers, Mechanical Engineers, Municipal Engineers, Railroad Engineers, Sanitary Engineers, Gas Engineers, Hydraulic Engineers, Technical Men.



Technical Book Department

MacLean Publishing Co. **143 University Ave., Toronto**

A WIDE RANGE OF WORK

can be successfully handled on the

ALFRED HERBERT LIMITED HORIZONTAL MILLING MACHINES

No. 22 HORIZONTAL MILL, 42" x 13½" x 21".

WORKING SURFACE OF TABLE, 68" x 17". **AUTOMATIC FEEDS IN EVERY DIRECTION**

These machines not only handle a **wide range of work,** but what is even more important, they **continue to handle it successfully,** or in other words, our Milling Machines will run with consistency and at the same time retain their accuracy.

All the materials used in their construction are severely tested in Herbert's laboratory.

20" Engine Lathe with Quick Change Gears

Since the introduction of High-Speed Tool Steel into everyday machine shop work it is necessary that your tools be built to withstand this extra strain. Our lathes have been so designed that they will maintain their rigidity and alignment under the most severe operating conditions.

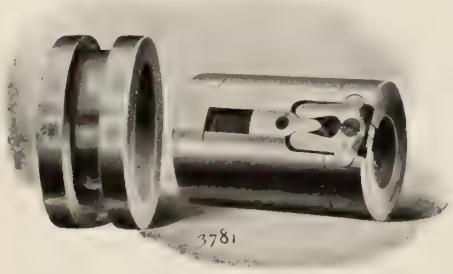
GALT :: ONTARIO

Builders of High Class Machine Tools and Woodworking Machinery

A Good Head Gets Results



Note the *three* liberal spindle bearings, providing unusual support.

The P. & W. Turntable Lathe

is provided with a remarkably well built head. A few distinctive features are as follows:

1. Head is oil tight, permitting gears to run in an oil bath.

2. All gears and clutches are accessible by simply lifting off the head cover.

Expanding ring clutches used in headstock

3. All gears are of coarse pitch and have a wide face.

4. All bearings are provided with independent lubrication.

5. Boxes are of bronze, are accessible and have easy adjustment for wear.

6. Spindle is located centrally on the ways, bringing work close to the operator.

7. Unequalled clutches of the expanding ring type are provided. They are easily and quickly engaged, and afford a very powerful grip They are accessible, easily adjusted and their durability is unquestioned.

8. Eight spindle speeds covering a wide range are available. They may be changed while the machine is running and are within easy reach of the operator, while watching his work.

Write for full descriptive catalog "Turntable Lathe."

CHEAP AIR or CHEAP COMPRESSOR, WHICH?

You can't have both because it's the very features that make for cheap air that increases the cost of a compressor.

Curtis Air Compressors

furnish cheap air—

BECAUSE they make available the power they consume, with the least possible loss, and do this year in and year out at the lowest operating and maintenance cost.

Records of fifteen years and longer in service is proof of their longevity. Their capacity is 95 per cent. of their piston displacement. Heads and valves, as well as cylinder walls, are water cooled, and they have the fewest possible moving parts (no piston rods, no stuffing boxes, no crossheads, and no guides); hence, there is less friction, less power required, less oil, less attention and greater freedom from breaking down losses.

"The Mueller for Mine"

The Standard Type Mueller is especially adapted for shops where the work requires a high priced Radial Drill. We also build Simple Type Radial Drills for those whose work does not require our Standard Type Drill.

We wouldn't turn out a drill at any price if it wasn't good enough to be labeled "Mueller."

Mueller Radial Drill

is the **only** radial drill having a patented stationary column. This column is one of the most valuable features of our drill, because it prevents springing of the arm when the drill is under severe strain, eliminates all vibration, and enables you to do the heaviest class of work, in the shortest possible time.

It is one whole piece, and reinforced by four internal webs extending from top to bottom, and is finished by grinding, making it very accurate.

Send for the Mueller Catalog

No User of Ball Bearings Can Afford to Neglect These Points

1 **Double Row of Balls**—virtually two bearings in one—a splendid feature under **any** load condition.

2 **Pressed Retainer in One Piece**—made from Swedish Lancashire Iron. No rivets, wires or screws to work loose, jam balls, disarrange spacing or make noise.

3 **Outer Race Spherical**—providing for a frictionless self-alignment that absolutely and automatically compensates for shaft spring.

4 **Best Swedish Crucible Steel**—Carefully heat-treated and uniform in hardness throughout. Unequalled for toughness, carrying capacity, accuracy and durability.

SKEFKO

is the only truly self-aligningbbearing. This feature alone is worth most careful consideration.

SKEFKO Self-Aligning Double-Row, Double-Capacity, Double-Life Ball Bearings cost no more and are made in international standard sizes. Their use is practical under any speed and load condition and the lubrication and protective housing can be made to conform to any service requirements.

SKEFKO are the recognized standard and are replacing other constructions in many types of machinery.

Our literature explains these matters in detail. Your best interests demand that you investigate. Tell us your bearing troubles and ask for our bulletins.

The Necessity of Efficiency in the Office and Foundry*

By Loyal S. Wright **

A foundry may have up-to-date machinery, its capital may be ample, and its product be near perfection, yet there may be no "efficiency." In this address, Mr. Wright outlined some of the essentials of an efficient organization, and emphasized increasing the efficiency of the individual unit, which is trueness plus, by eliminating weakness, sickness and laziness.

PERHAPS business is the only occupation that has not had the true application of science. Some people do not seem to understand what the word science means. In Spencer we find a very simple definition. He says, "Science is organized knowledge, classified facts," therefore, if we get at the basic facts of any subject and correlate them, we have a science. A doctor is not a professional man, however, because he is a scientific man. The difference between profession and science is in practice, so that a business man might be thoroughly scientific, yet if he did not practice this science he would not be a professional man.

The Profession of Business.

There is, and should be, no greater profession than the profession of business. I will give you in a simple way the result of many years of careful research work, and the expenditure of large sums of money in order to reduce business building to a science. That the institution that I have the honor of representing has been successful in doing this is a generally conceded fact.

Three great truths I want you to grasp —and if you truly appreciate them and use them, you will have received a great deal of benefit. The first one is that the science of business is the science of service. The second is, that he who serves best will profit most. The third one is that employers and heads of departments are teachers of their people, consciously or unconsciously, and it is the duty of every employer to realize this and to take means for training the people under them. We do not come assuming that we can run your business better than you can, because we know that your years of experience have made you more or less expert in your particular line, especially in regard to technicalities. We humbly admit you know more about this than we do. What we have to say is suggestive power and methods in order that the execution of your business may be made easier.

Four Departments Involved.

It is well for us to have an understanding of what we mean by the term efficiency. Efficiency is the accomplishment of one's work with the least expenditure of space, time, money, material and energy. I want to confine myself to four departments, namely, producing, executive, financing and selling. I wish, in your imagination, you would draw a circle, and label that circle Business Building. Draw another circle within the other and label that Salesmanship. Draw a third circle, which shall be the inner circle, and label that Service. Thus you see that the blood of business building is salesmanship, but the heart that pumps the blood is service. If you want the heat of profit you must first build the fire of service.

Again, if you will imagine in your mind four great cups. At the top we will call the first cup the Manufacturing Department of business. Over at the right we will name the second cup the Executive department. Over at the left we will call the third cup the Financing Department, and down at the bottom, forming a diamond shape, we will call the fourth cup the Selling Department. The Manufacturing Department, the Executive Department and the Financing Department all pour their product down through the selling department. This does not mean necessarily that the selling department is the most important, but rather, that all four departments are so closely allied and linked together that they form the great composite salesman, and a lack of efficiency in any of them means a general lack of results for the composite salesman, or the firm itself.

Advent of Advertising.

Some years ago competition started in this way. A certain company tried to do a little better than a certain other company that was manufacturing practically the same goods. The other company in turn went the first company one better, and then the first tried to outdo the other by manufacturing their goods a little better. The result of it was that they were perfecting their product to a large extent and thus competition was a benefit, because it made them think. It started their energies to work. Just at this point came that important written salesman called Advertising. Companies commenced to realize that if they made a success of their business the people in general must know of it, and know something of their products—so they commenced to spend large sums of money through this channel of advertising. Many thousands of dollars have been poured into the gutter through inefficient advertising, and there is still a large flow of money taking the same course. Later, there came the engineer in the business, whose profession it was to systematize and organize and show where waste should be eliminated and efficiency increased. Business, in consequence, has developed and grown, until it has reached this age of specialization, this age of expert artists, and the manufacturing end of the business has finally come to this important conclusion, that they might have a splendid manufacturing plant as far as machinery goes, that they might have ample capital, their product might be nearly perfection, but unless the brains of the individuals through their plant were right, they still would not have efficiency.

Efficiency of the Individual Unit.

The great problem in every country has been to increase the value or efficiency of the individual units, knowing well that if we can successfully increase this, that the composite whole will take care of itself. The efficiency of any individual is measured by the degree of supervision which he requires. This supervision is necessitated because people make mistakes—or commit errors. You have all known this for years, but what you have not known is why people make mistakes, why they commit errors. Here lies the essence of this science.

Loyalty in Business.,

That there are positives and negatives in human nature is an acknowledged fact. For instance, in nature we have light and darkness, in human nature we have observation and carelessness. We have imagination and dullness, concentration and scatteration, memory and forgetfulness, reason and unreasonableness, etc. Every normal individual has the faculty to think (this does not mean they all do it, by any means.) They have the power of emotion or feelings, and they have the power of will—choice—and they have the physical side. The positives which I have just mentioned will be found in the know-

*Address delivered before the Philadelphia Foundrymen's Association.

**Eastern Sales Manager, The Sheldon School, New York City.

ing part of the mind, or intellect. In the feeling part of the mind we have powers like faith as the positive, with doubt for the negative; loyalty and disloyalty, honesty and dishonesty, etc. Let me call attention to the faith in business—commercial faith. The man who has this faith in himself, in his business, in his employer, radiates the very spirit of confidence, and confidence is the basis of trade. We connot make profitable permanent patronage without instilling confidence into the minds of the buying public, and confidence is radiated through that man who has commercial faith.

Let us dwell for a minute on loyalty. There is no greater word in the whole organization of business than loyalty, that spirit in employees which is trueness plus, that makes the employer feel he can absolutely rely upon such persons that he knows they are doing their business and would do no different if they stood in his place. Gentlemen, such a spirit as that brings about that team work which always results in the highest business success. The positives which I have just named in the second division are found in the feelings of the individual.

The Physical Feature.

Let us look at the physical side. We cannot slight this or pass over it lightly, because it is an important part of the commercial organization. Socrates said, "We must be better horses." That a vast amount of business is lost, and that many errors creep into the routine because of physical trouble, is an acknowledged fact. It, therefore, behooves us to study the development of strength by eliminating weakness, of health by eliminating sickness, of industry, by eliminating laziness. Perhaps as much business is lost through this last negative, laziness, as by any other.

There are too many clock watchers. Too many people are like the colored man lying out in the field in the shade of a tree. The planter came along and saw a negro lying under the tree in his field in the afternoon. He looked at him and said, "You negro, what are you doing?" He said, "Boss, I'se the man that was sent here for to hoe this field." "Well, what's the matter? Why ain't you hoeing; are you tired?" He replied, "No sir, I ain't'zackly tired, I was just waiting for the sun to set so that I could quit work." Too many people are not tired, but they are simply waiting for the whistle to blow, that's all, so they can go home.

Development of Initiative.

When we develop the knowing powers of the mind, the result will be increased ability of the intellect. When we develop the feeling part of the mind the result will be increased reliability of the individual. When we develop the physical powers of the body, the result will be increased endurance. Ability, reliability and endurance do not, however, make a successful man. He must develop such powers as initiative by eliminating inertness, decision against indecision, dispatch as against procrastination, perseverence instead of fickleness, and with the development of such positives as these we get his increased action. Gentlemen, the man of positive action is the man who does things, and while I will grant you he may make mistakes, yet, we can overlook a few errors.

Now, if you will go back with me for a moment, you will find that we are evolving a valuable formula, or a yardstick by which you can measure yourself and any employee whom you may have. I said the value of an individual was lessened by the supervision required, necessitated by his errors or mistakes. Every error he makes can be traced directly to some sixty or more of the negatives which exist in his mind and body. Every negative has the germ of the positive power; therefore there are sixty of those. I have shown you briefly what the development of these positives in the knowing, feeling, physical and willing part of the mind means, and the result has been ability reliability, endurance and action. If you will just take the first letter of these words you will find we have the "Area" of the individual. The extent of this "Area" will determine the ultimate measure of his success. The "Area" of an institution makes up that institution as a whole, so you can see how vastly important it is that you teach each man, and that you train yourself in this great "Area" development.

Salesmanship.

There is a vast difference between the salesman and the order-taker. We believe that the salesman is born and made. We do not believe in the old rusty statement that a man is a "natural born salesman" except so far as he is naturally born. The only natural born salesman I ever saw was the wooden Indian in front of a cigar store, and he sometimes takes more orders than the clerk behind the counter. Granted that the individual has ability, reliability, endurance and action, the next important step for him to master is the science of reading the other fellow and suffice it to say that every salesman, in fact every business man, should be a master of this subject.

In business building and in salesmanship there are four important factors. The first one is the salesman himself; the second is the customer or the other fellow; the third is the goods or article which he handles, and the fourth is that intangible thing which we call the sale itself. Touching the third factor in business building and salesmanship, namely, the goods, we find there are four important things which we must know. The first is the ability to analyze the subject at hand, or the goods, the article which we are selling; to be able to break the great mass up into units and to ascertain the value of each of those units into a logical arrangement, order or sequence of points; lastly, to be able to express this knowledge in the best possible, clearest way.

A man may know all about his product, and be able to analyse it thoroughly; for instance, I feel quite certain I could take my watch all apart, each of its intricate wheels and parts. I might be able to do this, with a hammer and a screw driver. I am also certain I could not put that watch together again so it would run. In like manner, a man might be able to analyse his goods thoroughly and minutely, and yet not be able to put the result of that analysis in such form that it would appeal to the mind of the customer and persuade him to buy.

This naturally leads us to the question of what takes place in the mind of the customer, because we are all familiar with the fact that the sale is a mental thing and that it takes place in the mind, and that the mind passes through certain distinct mental steps.

How to Effect a Sale.

The first step is favorable attention. There are two kinds of attention—favorable and unfavorable. Unfavorable attention will naturally lead to disgust and repulsion. Favorable attention, if held, will naturally lead to and culminate in the sale. Favorable attention sustained or held, will, of its own accord change into interest, which is intensified attention. If desire is augmented sufficiently it will naturally result in action, or decision to buy. This makes you see that salesmanship, being a mental thing, requires a tremendous lot of magnetism and of enthusiasm.

Let me suggest a definition of salesmanship which you can easily remember. Salesmanship is "The Power to Persuade Plenty of People to Purchase your Product at a Profit." You see how important this last is in this definition. If you leave profit out, you have an order taken, and not a salesman. When the customer's mind passes through these four mental steps and the money and the goods change hands, then we have business-getting, yet a great many concerns mistake this for business-building. For business building there are two more

steps necessary. The first step is confidence, as the result of business done; the second is satisfaction, as the result of service rendered. The best advertisement you can have is the wagging tongue of a satisfied customer.

There is, then, a science of salesmanship, and a science of business-building, but both of these rest heavily upon the science of building the individual.

STANDARD CROSS SECTIONS.

THE committee appointed by the American Society of Mechanical Engineers to go into the question of cross-sections and symbols have presented unanimous findings. They are strongly of opinion that a standard method of showing materials in cross-section should be recognized, and state that there are many advantages in the use of such cross-sections and symbols. It is as easy to draw an adapted design to represent a specific material as to draw any other. It makes mechanical drawings easier to read and understand, and diminishes the danger of interpreting their meaning wrongly.

They do not believe it wise to complicate the matter by adopting too many standard cross-sections or symbols. It would be best, they consider, to have standard cross-sections for the most commonly used materials, and that these should be of such a character as to permit of subdivision, if found desirable. To this end, they propose the use of standard cross-sections to represent nineteen materials as shown in Fig. 1, —cast iron, wrought iron, cast steel, wrought steel, babbit (or white metal), copper (brass or composition), aluminium, rubber (vulcanite or insulation), glass, wood ,water, puddle, concrete, brick, rubble, ashlar, rock, earth and sand. To facilitate the drawing of cross-sections, the committee have used the same thickness for all lines made with the drawing pen.

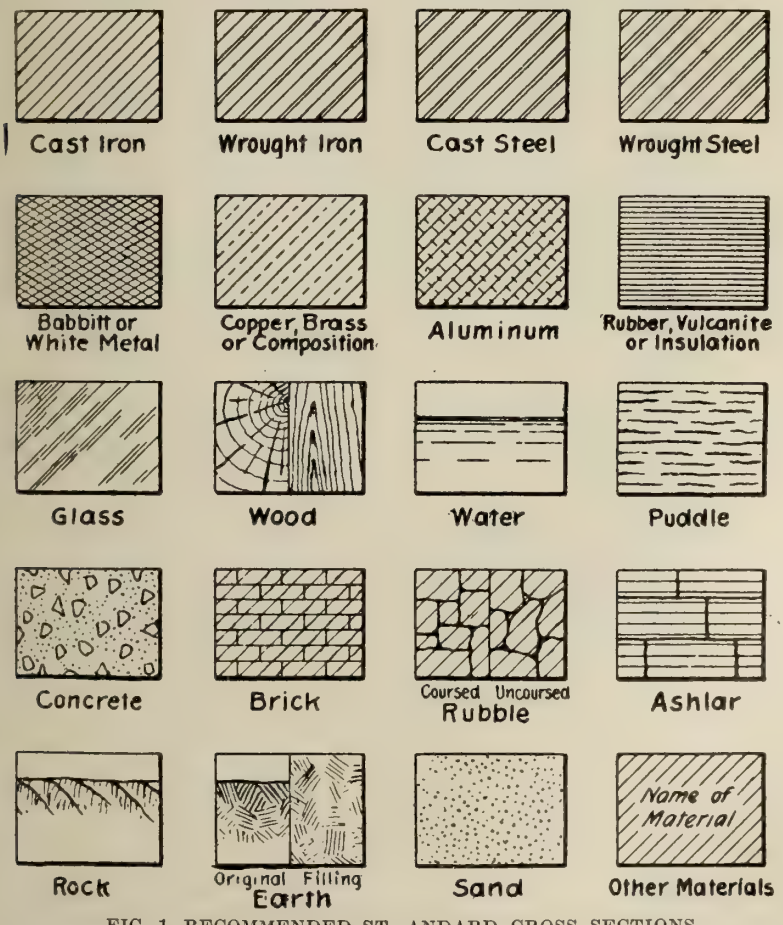

FIG. 1. RECOMMENDED ST ANDARD CROSS SECTIONS.

On some drawings it may be desired to specify a material other than those mentioned above, or some particular kind of material which the above generic names would not clearly indicate To cover this contingency, they recommend writing the name of such material on the section and cross-hatching the section, as shown in Fig. 1 under the title "Other Materials." They recommend, also, that subdivisions of any of the materials shown generically on Fig. 1., should be made by taking one of these standard cross-sections as a basis and making minor changes, but maintaining the general characteristics; or by writing on the standard section the name of the material. To illustrate, the committee have subdivided concrete into concrete blocks, cyclopean-concrete and re-inforced concrete, as shown in Fig. 2; also wrought steel into nickel, chrome and vanadium steels.

FIG. 2. TYPICAL SUBDIVISIONS.

It is urged that the standard cross-sections should be printed in a suitable form for hanging on walls of drafting rooms of engineers, architects and educational institutions, so as to encourage their universal use.

CURES FOR MISFIT EMPLOYMENT.

By H. F. J. Porter.*

DON'T expect to find in strikes the greatest industrial waste; it will be found in the wrong employment of men. Out of ten men probably only one fills the job that he ought to be filling; and out of ten jobs probably only one is filled by the man who ought to be engaged for it.

The Testimony of Common Experience.

Of all the statements made before the last Conservation Congress at Indianapolis, this one left perhaps the strongest single impression upon the thousands of delegates who had gathered to consider the saving of vital resources. Every one felt that the plain, unsupported statement needed no statistical evidence to give it weight. Common ex-

*Secretary, Efficient Society.

perience testified to its substantial correctness. Of course, there are jobs that are not fit for any man. They are not careers—they are seething infernos. Again, there are men who are as certainly not fit for any job. Such jobs and such men are huge unsolved public problems in themselves, but an even greater problem confronts society, because, in nine cases out of ten, the fit man and the fit job do not meet.

Vocational Guidance.

To grapple successfully with the delicate and perplexing task of the assignment of work will require increased effort along several lines. Vocational guidance is perhaps the most important. Genuine expert advice to young or prospective wage-earners as to the work for which they are fitted is a social need of the greatest value. In response to recognized need, a science is developing for the discernment of latent talent, and the men engaged in this work will have an increasing influence upon educational methods. Indeed, the time is not far off when vocational guidance will begin with the kindergarten, and when, as fast as a talent is discovered, it will govern the later emphasis in the education of the student. This will mean a gradual and rational induction of all pupils into special studies so that they will pass almost imperceptibly from general theory into the actual conduct of their life work.

At best, however, vocational guidance secures only approximate judgments. There are many jobs within a vocation, and there are great numbers of men in each calling. A much closer articulation between worker and work is needed than a mere tactful steering of a talent into the kind of labor for which it is designed. Work within a vocation has infinite variations, and to secure every time, the man who most nearly fits the requirements, demands from the employer or his agent a special discernment. The science of hiring, of which we hear relatively little, is needed to supplement the science of vocational guidance.

The Science of Hiring.

Only recently the Efficiency Society, which includes among its thousand members many of the largest employers of the country, emphasized this new subject of scientific hiring at a special conference held in New York. At this meeting the various standards for appraising men were briefly considered. During the coming year the society will conduct careful investigations concerning this important supplement to vocational guidance.

A wider interest in these two complementary subjects, the science of guiding the worker and the science of selecting the employee, will go far toward elminating the economic wastes from misfit employment. There are other remedies to be applied to this problem, however, which are of an equally fundamental nature. Sometimes a deserving man doesn't find the right job because he is miles away. To remedy this situation there must be a freer movement of labor and better means for spreading reliable information about the conditions of work in various localities. Little short of Federal Governmental action or a national co-operation between State and municipal employment bureaus can provide such facilities.

Complete Industrial Organization Necessary.

Sometimes a man doesn't find the right job because he cannot afford to wait for it. Seasonal fluctuation in industry frequently throws capable people out of employment and forces them into work for which they are less fitted, but in which they are often by economic necessity compelled to stay. The cure for this is a more complete industrial organization. A thoroughly organized industry, by registering all of its members, by insuring them against temporary unemployment through funds to which employer and employee contribute equally, and by scheduling work so nearly continuous as possible, will enable workers to choose their careers and to remain with them in increasing efficiency and contentment during their productive years.

GRAIN ELEVATORS FOR THE WEST.

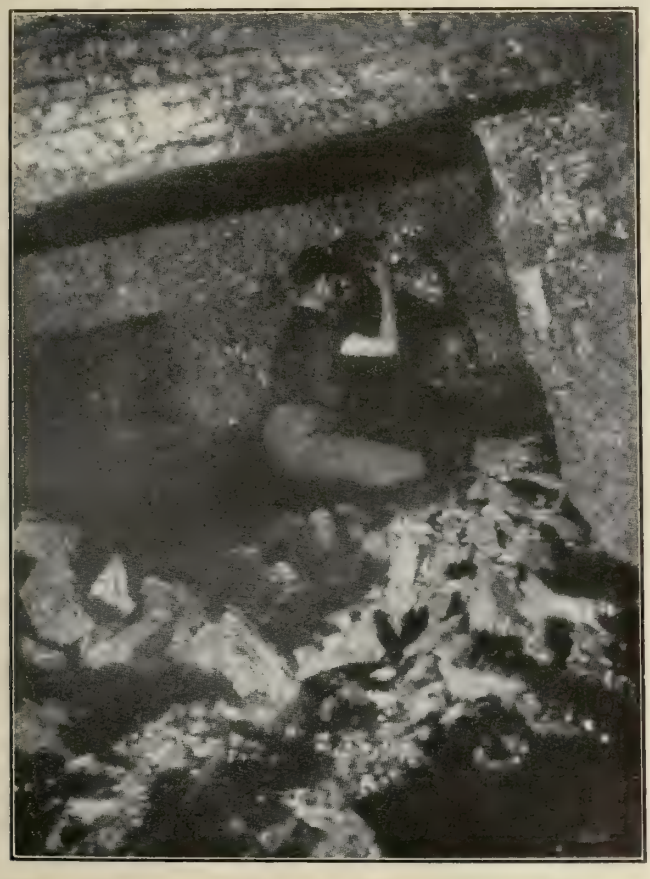
THE annual report of the Federal Grain Commission, issued on Feb. 3, strongly recommends Government action towards establishing a system of Government internal grain elevators in the West, with transfer elevators on the Pacific and Hudson Bay, so that there will be adequate facilities for handling future grain crops to the best advantage, on the completion of the Hudson Bay Railway and the Panama Canal. The Commissioners suggest that they be given authority to investigate and report on the most suitable locations for these elevators. They also recommend sample wheat markets at Winnipeg and Fort William, and the establishment at Winnipeg of a laboratory for testing the milling and baking qualities of Canadian grain.

The report notes that there are now in the West 2,225 elevators, with a total capacity of 67,000,000 bushels. The capacity of the terminal elevators at Fort William and Port Arthur is given at 27,820,000 bushels, as compared with 25,700,000 in 1911. During 1912 preparations were made for additional storage accommodation to the extent of 12,120,00 bushels.

D.C. SUB-STATION DESIGN.

"NOTES on Direct-current Sub-station Design and the Plant Installed," was the subject of a paper read by Mr. H. D. Phelps before the Newcastle Students' Section of the Institution of Electrical Engineers. The author outlined the principal requirements of the site, buildings, etc., and discussed the lay-out of plant therein. He described the principal features of induction motor generators, motor converters, rotary converters, and synchronous motor generators. and discussed their relative merits for sub-station equipment. Induction motor generators, on account of their low efficiency and poor power factor, especially at light loads, might be left out of consideration, as also might synchronous motor generators, on account of their high cost. In comparing motor converters and rotary converters, he gave preference to the latter for 25-cycle traction sub-stations, but for higher frequencies he considered the motor converter more suitable and less liable to flash over.

MECHANICAL STOKING OF LOCOMOTIVES.



WITH the rapid increase in size and power of railway locomotives during recent years, the problem of mechanical stoking has engaged the attention of locomotive engineers, especially in the United States, and several more or less satisfactory contrivances have been evolved. Tests made in South Africa have demonstrated the usefulness of such an appliance, and, as it becomes necessary to provide still larger engines, there is no doubt that a suitable mechanical stoker will become more and more a necessity. That now being experimented with on these railways (reports Mr. Hoy) is an advance on any previous type tried, but further improvements are necesary before it can be said to be of practical value. When oil fuel is available at a cost which will compare with coal, locomotive work will be much simplified, and it is hoped that oil will yet be found in payable quantities in Africa south of the equator.

Some men control their business; others are controlled by it. Some men are more self-sacrificing than others, some are more industrious, but when all is said and done, the only real way to get a man to work well is to offer him something worth working for.

The Coal Resources of the Dominion an Empire Asset

In these days when so much attention is being directed to the possibilities of oil fuel in its varied applications, it may not be amiss to point out the prominent place that coal mining fills in Canada's industrial development, and to have brought home to us some facts and figures concerning same.

OUTSIDE the United Kingdom the nearest Imperial source from which fuel can be secured is Canada, and the nearest portion of it in which extensive coalfields exist is Nova Scotia. All the discovered coal measures of the province are adjacent to the coast, and those who are acquainted with the mineral resources describe the supply as inexhaustible. Twenty years ago, Nova Scotia's annual production of coal was about 1,000,000 tons, a figure which five years later had increased by 50 per cent., and within a decade by 100 per cent. In 1911 the output aggregated 6,994,000 tons, valued at about $14,050,000, the increase in production as compared with 1910 being 600,000 tons. The industry gives employment to some 12,000 persons, whose annual wages bill amounts to $7,500,000.

COAL HEWER AT WORK IN A CAPE BRETON MINE.

The largest colliery undertaking in the province is the Dominion Coal Co., who have seventeen collieries in operation and three more which will, before long, be adding their quota to the Company's aggregate output. They raise at present 4,000,000 tons annually. Second in the list of producers are the Nova Scotia Steel and Coal Co., the other big concerns being the Acadia Coal Co., the Inverness Railway and Coal Co., and the Maritime Coal Co. The Dominion Coal Co. produce a steam coal of good quality and do a large bunkering business, besides shipping coal to such far-distant markets as Mexico, South Africa, and the West Indies.

Eastern Coal Deposits.

The tendency in Nova Scotia is towards the extinction of the small coal-owner. Two decades ago the number of companies engaged in the industry was twenty; to-day there are under a dozen, and only six of these are operating on a really large scale. The coal deposits may be divided into four divisions. There is, first of all, the Cumberland coalfield, situated on the Bay of Fundy, where, however, the cost of mining is rather high owing to the disturbed conditions of the coal measures. The same remarks apply to the Pictou and Inverness districts, and in the case of the latter, the difficulties are somewhat increased owing to the necessity for carrying the workings under the Gulf of St. Lawrence. Inverness coal is, for the most part, of fairly good quality, but the lack of adequate and ice-free harbors involves long haulage of the coal—in some cases all the year round—to the Straits of Canso.

Nova Scotia's richest store of coal is contained in the Sydney field, in which it is estimated that there lie some 9,000,000,000 tons. The area extends for about 32 miles along the coast, runs about 8 miles inland, and can, it is believed, be penetrated for miles under the sea. The measures are dry and free from gas, while the easy incline at which, for the most part, the coal lies, added to the contiguity of good harbors, have combined to create an industry of important dimensions. During 1911 the Dominion Coal Company alone shipped 1,450,000 tons to St. Lawrence ports, they having a fleet of steamers which carry a large proportion of the total production during the open season of navigation.

Western Coal Fields.

Taking the Dominion as a whole, the total annual coal production is in the neighborhood of 13,000,000 tons, this figure comprising sales and shipments, colliery consumption and the fuel used for making coke. Crossing the Dominion towards the Pacific coast there are coal measures of minor importance in New Brunswick, but no seams of any magnitude are found until we reach Manitoba. The coal-bearing area of this province extends for about 15,000 square miles; while the neighboring Province of Alberta contains something like 85,000,000,000 tons—lignite, bituminous and anthracite. Little of this could be of much service to the Mother Country, in view of the long rail haul to the coast, but it is, nevertheless, interesting to learn that in the opinion of an eminent authority on the mineral resources of Canada, the richness of the Alberta measures renders it highly probable that in course of time the province will become one of the greatest coal-mining centres, not only in the British Empire, but in the world.

In the year 1910, the daily output of the Alberta mines, of which there are about 150, large and small, in operation, was about 18,000 tons; in other words, the annual production was nearly 3,000,000 tons, an increase of 59 per cent.,

compared with the figures for 1907. The total production of the Dominion in 1910 was almost equally divided between the eastern and western coalfields, and Alberta contributes about 22 per cent. of

NOVA SCOTIA STEEL & COAL CO. COAL AND ORE PIERS AT NORTH SYDNEY, C.B.

the whole, as against 5 per cent. ten years previously.

In British Columbia a coal of better quality is produced, there being several rich seams of excellent anthracite. In 1910, the coal output of British Columbia reached a total of 2,800,046 tons, of the value of $9,800,161, which figures constitute the highest ever recorded in the history of coal-mining in the province. The greater proportion of the output—about 79.3 per cent., in fact—came from the collieries owned by three companies—the Canadian Collieries (Dunsmuir), Ltd.; the Western Fuel Co., on Vancouver Island; and the Crow's Nest Pass Coal Co., in the East Kootenay or Rocky Mountain district, which, by the way, exports something like 80 per cent. of its production to the United States.

Mr. W. F. Robertson, the mineralogist of the Province, states in the annual report on the mining industry of British Columbia that the demand for export coal, especially on the seaboard, has been so constant and the price obtainable so satisfactory to the shippers that it has permitted of the domestic price being maintained at a figure which enables Californian fuel-oil exporters to compete for the fuel requirements of those railways and steamships which burn liquid fuel. "The maintenance of the present high price of coal on the seaboard in face of the direct competition of fuel-oil both in British Columbia and Pacific Coast of the United States, and the fact that the British Columbia collieries have greatly increased their output, would," he says, "seem to indicate that the market is growing faster than the collieries are being developed, and that the present price of coal is likely to be maintained, a consoling thought to the mineowners, if not to the consumer."

SHIPPING BRITISH COLUMBIA COAL AT NANAIMO.

LOADING CAPE BRETON COAL.

Coal in British Columbia.

In spite of the operations of the various colliery companies the coal measures of the province have as yet hardly been scratched. Many fields of proved value, though they have been partly developed, have not contributed a ton of coal to the market, largely because the demand is at present fully supplied. Lack of transportation facilities is another obstacle, albeit this can, and doubtless soon will, be remedied. Hundreds of millions of tons of coal are lying ready for the hewer, and a very considerable prportion of this hidden wealth is situated adjacent to the Pacific Coast, both on the mainland and on Vancouver Island. In the valley of the Skeena river there exist extensive beds of anthracite, the output from which could be brought to tidewater at comparatively moderate cost. The coal industry of the Dominion is making steady progress, although the report on mineral production issued by the Department of Mines, show a slight decline in 1911.

Bunkering Facilities at St. John, N.B.

The bunkering facilities provided by the port of St. John, New Brunswick, may prove of interest, seeing that geographically it is very favorably situated for vessels engaged in the North Atlantic trade. No other Canadian Atlantic port can compete with St. John in point of cheapness, for there is no reason why coal from the adjacent Queen's County field should not be brought down the river for at least seven months in the year at a cost of from 16 to 20 cents per ton, as against a dollar a ton in the case of the Cape Breton coal generally used in the port. Moreover, the price of the latter is enhanced by unnecessary hand-

ling, which also means breakage. Queen's County coal has been employed with satisfactory results by at least one British steamship company engaged in the Canadian trade.

From the foregoing it will be noted that we have not only the resources for more than immediate future contingencies, but the port facilities and ready markets in addition.

AIR-OPERATED HYDRAULIC DROP PIT JACK.

By M. J. Hayes.

THE operation of removing the driving wheels from locomotives is accomplished in a great many different ways in the various railroad plants of the country. In the majority of shops a traveling crane is used, which lifts the engine off the wheels and carries it to another pit, the wheels being then carried away to the wheel lathe. In others, an electric hoist is used which raises the engine up, the wheels being then rolled out and the engine let down again on blocks. In some shops with limited facilities jacks are still used, and the engine is jacked up first at one end, and then at the other, being blocked securely at each end in turn, until finally it is high enough to allow the wheels to be rolled out. This is a laborious and dangerous operation and takes considerable time and labor to accomplish.

The method in use, where the number of the engines handled does not justify the installation of a traveling crane, is the drop pit method. In such a shop, the engines are moved over a pit with removable rails, and a jack, mounted on a

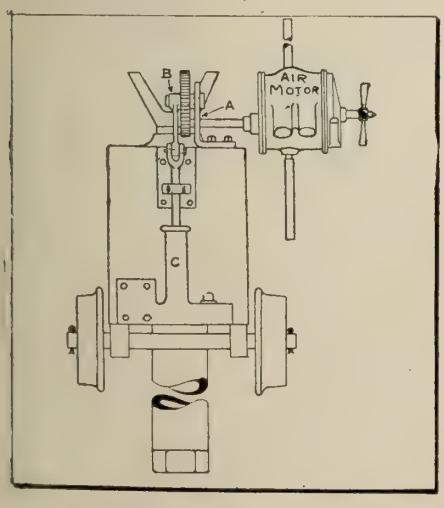


FIG. 1. AIR OPERATED HYDRAULIC DROP PIT JACK.

carriage, runs along the pit bottom. After removing the pedestal binders and taking the weight of the engine with jacks placed under the buffer beam and end rails, the pit jack is run up and takes the weight of the pair of wheels off the rails which are then removed and the wheels lowered into the pit. The carriage and wheels are then moved clear of the engine, and the wheels jacked up level with the floor and run off to the wheel lathe or wheel press. The rails are then replaced, the locomotive is moved forward to bring the next pair of wheels over the jack and the operation repeated. In replacing the wheels, the operation is of course reversed.

Different styles of jacks are used in such pits; some use the screw jack, which is very slow, while others use air jacks

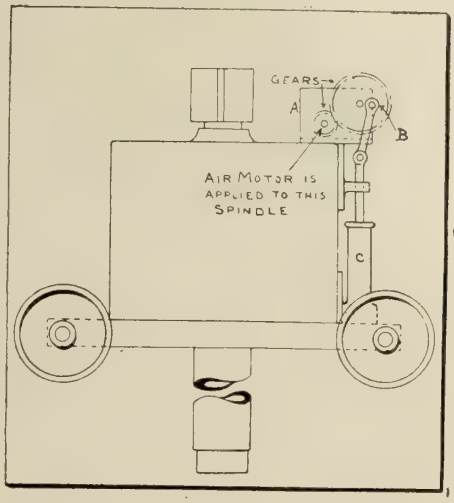

FIG. 2. AIR OPERATED HYDRAULIC DROP PIT JACK.

which are fast, but not always safe. The majority prefer the hydraulic jack, which, although not so fast as the air jack, is a great deal more dependable.

The accompanying sketches show how a hydraulic pit jack was changed at the shops of the T., H. & B. Rly. at Hamilton, Ont., and made nearly as fast as an air jack, while still retaining the safety of the hydraulic. Originally it took two men on the end of a 4-foot lever to raise a heavy pair of driving wheels into position under an engine, and took just five times as long as it now takes a boy and a "Little Giant" air motor to do the same thing. As will be seen by the sketches, after taking off the hand lever, two gears with a ratio of four to one were fastened to the bracket (A), which was bolted to the top of the reservoir. In the larger of the two gears was inserted a crank pin (B), having a 2-inch throw. This was coupled up by a short connecting rod to the plunger of the pump. The small gear was keyed to a shaft, which extended through the bracket and had one end turned to a No. 3 standard Morse taper.

All that it is necessary to do now, when the wheels are to be raised, is to apply the air motor and turn on the air, the wheels being lifted into place with a great saving of time and labor.

RAILROAD CAR EQUIPPED WITH EDISON CELLS.

THE Electrician gives some particulars of a car which has been placed in service on the Chicago Great Western Railway for use in connection with the local passenger and express traffic. The car is equipped with 220 Edison cells for power purposes and 10 for lighting use. These batteries are placed under the car in two compartments, strongly reinforced and riveted to the underframe. The batteries are of the special railway type, and have 3 in. of electrolyte over the plates. The car is equipped with four 20 horse-power, 75-ampere, 200-volt, series-wound motors running at 720 revolutions per minute. Two of these are placed on each truck, one on each axle, and one wheel on each axle is driven by a gear fastened to the inside of the wheel hub, the ratio of reduction being 3.5:1. There are two series-parallel controllers, one on each end of the car, with four series and three parallel positions. All power wires are carried in conduit securely fastened to the underframe.

In all its trial runs the car showed very satisfactory running qualities. Most of its trips were made between Jersey City and Silver Lake, N.J., a round trip of about 20 miles. A maximum speed of 35.6 miles per hour on level track and 29.6 miles per hour on a 2 per cent. gradient was attained with an energy consumption reported to be 30.4 watt-hours per ton-mile in the former case, and 46.3 watt-hours per ton-mile in the latter. The car, including the battery, weighs 29.5 tons.

DRAWING OFFICE EFFICIENCY AND ECONOMY.

By A. M. Rochester.

THERE has been considerable discussion in the technical press lately on the above subject, one point considered being whether or not speed of execution has a large bearing on the general question of individual efficiency. The writer was for many years employed as a draftsman and has worked in a good many different shops and offices, so that his opinions on the subject are at least not those of an amateur.

Designers.

As the efficiency of the individual is largely and primarily a question of the right man in the right place, there are certain fundamentals which a draftsman, to be successful, must possess. He should first of all be a man of constructive habits of thought and possess an active imagination, so that he is able to see "in his mind's eye" the outline of the machine or other structure he is design-

ing. He should also have an analytical temperament to be able to systematically and logically consider each new point as it is presented and to recognize the good and reject the bad features of each. All this presupposes and should supplement a thorough and exact knowledge of the general principles of design and a full acquaintance with the state of development of the subject in hand and of present practice with regard thereto.

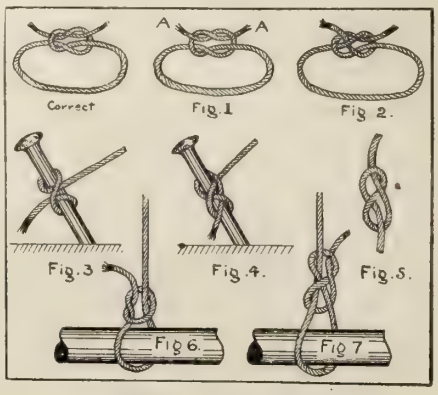
The above remarks refer more particularly to designers, or men doing original work, and it is usually a matter of wise economy to pay such men a high wage in view of the importance of the results expected. The matter of speed of execution of the work is usually secondary to the importance of having the work done thoroughly and satisfactorily. To try to distinguish between two men by the test of mere speed will give a very inconclusive result, since one man may be slow and methodical, never drawing a line until he is certain it will not have to be afterwards erased, while another man may draw a device a dozen times and rub it out time after time until he is satisfied with it. Both ultimately obtain the same result. Now if the slow man works three months on the job and the quick man works one month, but the slow man's design is acceptable while the other's is not, it is clear that the slow man's work is the more valuable, even if it cost three times as much as the other. It will usually pay to allow a designer all the time he desires to study a problem, provided the end sought is accomplished. It is not wise to hurry him unduly.

Detailers and Tracers.

When it comes to detailers and tracers, however, the question of speed in relation to economical production is of more importance. As the work of these men is of a more or less mechanical nature, not involving much original thought, it is comparatively easy to distinguish between different individuals on the basis of output, and to grade their pay accordingly. If two men at this class of work are on even terms as regards neatness of execution, it nearly always follows that the speedier one is the more efficient, and the element of speed should be a basis for determining which man's work is of the more value.

Time Saving Appliances.

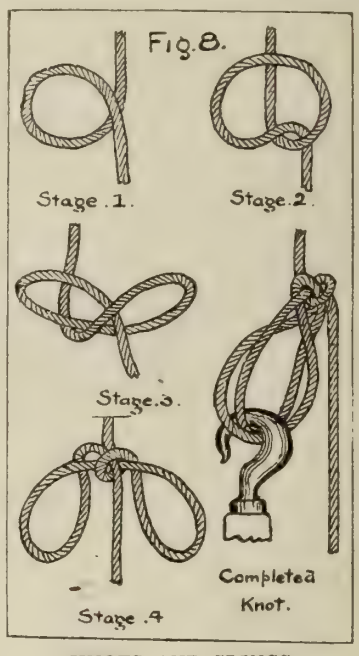
The writer was lately working in the drafting room of a firm which has given the question of efficiency in every department most painstaking attention and has been modernizing its methods with that end in view. This firm has made quite an investment in time saving appliances for the drafting department with a marked increase in the efficiency of the workers.



There are many things draftsmen occasionally need in their work and which few of them possess, as they usually consider that they will not get their money's worth of use out of them. Among these may be mentioned a beam compass, an 18-inch triangle, a pair of proportional dividers, etc. In the shop just mentioned all these are furnished for the general use of the draftsmen by the company, who believe that such appliances will receive sufficient use by a staff of twenty-five men to justify their purchase. In addition to the above, the company have installed a pencil sharpening machine, a section liner, a set of scales for odd proportions, such as 3 to 2, and a set of "Payzant" lettering pens for block letters and border lines. Other devices are being added from time to time. A great labor-saver to be found here is a motor-driven erasing machine, consisting of an ordinary circular eraser mounted on a flexible shaft joined up to a small electric motor. The latter can be coupled up to the nearest lamp socket, and by its use remarkable results are accomplished. In the drafting room in question all those appliances regularly supplied to the draftsmen by the employer are of the best type. Thus the drawing boards are equipped with parallel attachments, dispensing with the usual Tee squares; the tracers' inkwells are of the "Altenedeer" pen-filling type. In short, everything in the drawing office has been selected with a view to obtaining the most efficient results.

There are doubtless many firms who could follow the above example with advantage.

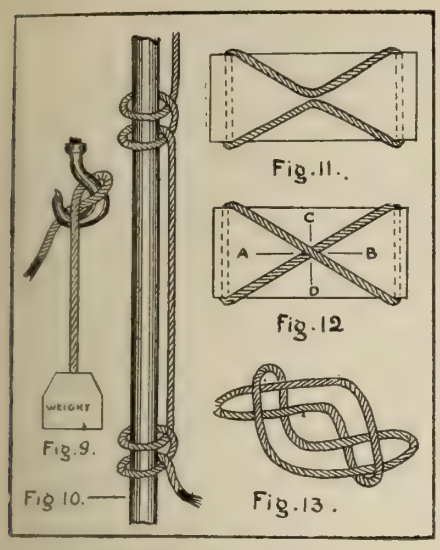
KNOTS AND SLINGS.



By F. R. Parsons.

AMONGST the duties of engineers, power-house attendants, mechanics and erectors generally is that of handling awkward-shaped and sometimes cumbrous masses of metal, engines and engine parts, machines, girders, joists, gearing, shafting, etc. There are innumerable little lessons to be picked up in this direction, which, when learnt, are invaluable as time savers and aids to safety. Many lives have been needlessly sacrificed through the snapping of a twisted link in a chain, a faulty knot in a rope, a rotten sling, eye bolt or shackle, or a job slipping out of its tackle when hoisted. Many of these accidents might have been avoided had those in charge known the right and safe way.

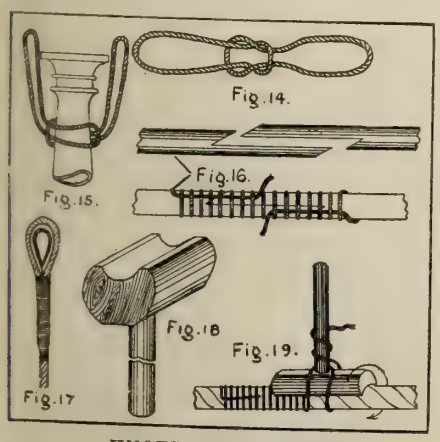
KNOTS AND SLINGS.



Slings and methods of slinging, the right and the wrong way of tying knots, hitches and bindings, are worth serious attention. Simple knots, simple as they may be in themselves, form the very foundation of that knowledge which any erector finds indispensable. Fig. 1 shows the right and wrong way of tieing two ropes together, or the ends of one rope in order to make a sling. In the right way no amount of tension will cause the ends to slip, but if wrongly tied, with ends (A) (A) as shown, these with ends (A) (A) as shown, these will have a tendency to withdraw themselves directly the pull is applied. A variation of this knot is also shown in Fig. 2. **A scaffold knot**, or as it is sometimes termed, two half hitches, is

KNOTS AND SLINGS.

another simple tie over which frequent mistakes are made. This is a knot useful for various purposes, not the least of which is securing the ends of guy ropes to stakes driven into the ground when erecting high derricks. This application which is the correct method of tying it, is shown in Fig. 3. Fig. 4 is another knot much in favour in some quarters, used for the same purpose, and really an adaptation of the simple twist or figure eight knot in Fig. 5. If you make a slip in the end of a rope like Fig. 6, you are courting trouble; see that the loose end is tied like Fig. 7.

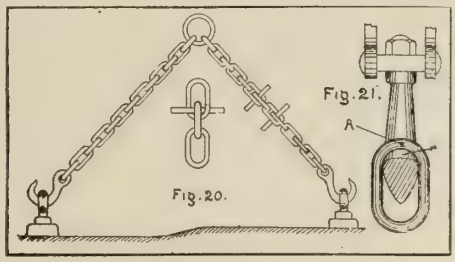


To make a bight in the middle of a rope on which to hang lifting tackle.—If the two ends are engaged and there is some loose rope in the middle, proceed

KNOTS AND SLINGS.

as shown in the first stage of Fig. 8. The second stage shows the single loop given an upward twist, thus forming a double loop—half on each side of the vertical portion of rope. Another twist in the same direction, keeping the loops equi-sided, brings the knot to the third stage. Take the two loops, fold them backwards (from you) and bring them together, and you are then ready to hitch in the hook of the lifting tackle. If this is done correctly you will have a bight which will never slip. It is quickly made and as quickly undone—which cannot be said of the ordinary doubled loop knot when strained tightly through lifting. In all knots of this description the primary object to keep in view is that each tightening curve or twist of the rope bears on the one which has the most tendency to slip. This is best exemplified by a study of the old and extremely simple loop seen in Fig. 9.

To lift a shaft into perpendicular position.—Some do this by lifting from



KNOTS AND SLINGS.

a collar or a lathe carrier affixed to the top end of the shaft; but an effective and secure way of doing it without the the use of these is shown in Fig. 10.

The Rope Sling.

A sling is a rope with the ends spliced together. It serves a variety of purposes and can be readily adapted to many requirements that a rope falls short of, but one can easily go wrong in using it, simple as it appears, for there are several wrong methods to the one right one. Fig. 11 illustrates a wrong method; the right method being to cross the sling as in Fig. 12. Here again there is a liability to go astray when attaching the hook for lifting. This should never be put through the loops in the direction (A) to (B), but from (C) to (D), and should this appear a trivial detail, try it and note the difference. **A basket hitch** is shown in Fig. 13, and its application in Fig. 15, attached for lifting (A) a cast iron column. When one sling is short join two together in the manner indicated by Fig. 14.

In splicing derrick poles, a good plan is to dovetail the poles to be joined, as in Fig. 16, whipping the joint with rope, and to ensure neatness with strength,

KNOTS AND SLINGS.

it should be done as shown. In starting the bind, leave sufficient of the first end of the rope so that it can be pulled tight when wound, and when finishing interpose a stick or hammer shaft between the pole and the last half dozen coils, so that when the latter number is completed, the stick can be withdrawn, and the rope end pushed through. Next, tightly pull up each of these coils singly, finishing off with a stout pull on the rope end. If this is done carefully, the coils being hammered down with a wooden mallet, as you proceed, and the ends pulled tight and afterwards cut off, you will have an excellent splice.

It may be of interest to describe the methods employed when a rope end requires to be bound around a "thimble" and afterwards whipped, as in Fig. 17. This, if done by hand alone, does not result in a satisfactory job, owing to the degree of tightness required. Therefore, it is best to have recourse to the method adopted by many old sailors. They use what is termed a "serving board," as illustrated in Fig. 18. It is made throughout of hard wood, finished with a round smooth handle, and longitudinally grooved to fit the diameter of the rope. The method of using it is shown in Fig. 19. The cord is twisted once round the instrument as shown, the loose end round the handle held lightly, and the board turned in the direction of the arrow. By this means, the whipping can be done quickly, and as tightly as the strength of the cord will allow.

Sling Chains.

If, when lifting with coupled sling chains, you find one end of the sling too long owing to the points of attachment being out of level, don't on any account knot the sling—it is a dangerous practice. Adopt the course shown in Fig. 20. Bolts or pieces of round iron interposed between the links will allow to a nicety for a limited amount of variation, and the work may be slung level without endangering the safety of the links.

Another danger with sling chains is that of using a link too small for the body of the lifting hook—one which does not bear properly but forms an arch. This danger is illustrated in Fig. 21, the tendency of the link being to fracture at (A) when strained.

Care Of Ropes and Slings.

Just a few concluding remarks on the care of ropes and slings. Don't allow ropes or slings to get alternately wet and dry, this rots the fibres. Don't keep ropes in a damp place. Don't permit ropes to get more greasy than can be avoided; remember that a knot always grips better in a dry rope than a greasy one. Don't put knotted ropes away in the store, always untie them and give them a few blows on the floor in order to straighten out the fibres. Don't allow the ends to become frayed; keep them whipped. Don't fail to protect a rope sling against contact with sharp edges or corner when lifting; interpose old sacking, waste or board. Don't fail to run your eye down a rope always before using. Don't under any consideration, permit a twist or a knot in a chain sling. Don't hitch a chain sling over a girder or joist in such a manner that a part of a link lying horizontally is overhanging the edge, and so has to bear the whole strain of the load. Don't fail to have your chain slings periodically annealed; the links become crystalized through repeated strains in one direction. Finally, don't forget that you can always have your slings tested by competent people at a nominal charge.—From "The Machine Tool Engineer."

Toronto, Ont.—Robt. S. Hunt was recently awarded $2,500 damages for the loss of a foot, sustained while taking down casings from a cement roof when the scaffold broke. John E. Webb Co., were the defendants.

Dundas, Ont.—A jury has awarded $1,650 damages against Jones Bros. Co., Ltd., to a widow, whose husband was killed in defendant's factory by being struck with a piece of wood that had come in contact with the belt or driving shaft of the wood-turning machinery. "Do I understand you don't accept the theory put forward that the deceased was holding the belt on by a piece of wood?" asked the judge. "We do not accept that theory," was the foreman's reply.

The defendant's lawyer moved for a non-suit, on the ground that the judge should have held that it was established that the accident was due to the negligence of the deceased, or to his disobedience.

Toronto, Ont.—The Kent Co., Ltd., Montreal, were sued recently by a stationary engineer in charge of refrigerating machinery, for damages resulting from the blowing out of a joint, which alowed ammonia to escape. Judgment was given in favor of the plaintiff, and damages were assessed at $1,000 and costs.

Toronto, Ont.—Judgment for $1,000 in favor of Mrs. Hattie Peacock and her two little daughters against Wells & Gray, was entered by consent at Osgoode Hall a few days ago, having been ratified by Mr. Justice Latchford. Mrs. Peacock sued for $5,000 damages for the death of her husband, Wm. Peacock, who was killed by the fall of a derrick, on September 13, 1912. He was foreman of a derrick crew, and had been employed by the defendants for nearly five years. His employers alleged that if the derrick was faulty Peacock should have known of it and remedied it. Of the judgment, $150 goes in costs. The balance will be paid into court and will be paid out in instalments for the maintenance of the children.

GRAIN SHIPMENTS AHEAD OF LAST YEAR.

The Canadian Pacific Railway has given out the official returns of all wheat marketed over their lines from September 30, 1912, to January 25, 1913. An increase of over 30 per cent. over last year in the gross amount of wheat marketed is shown, and an increase of nearly one hundred per cent. in other grains. This season, 81,747,000 bushels of wheat and 28,126,000 bushels of other grains were marketed, as compared with 61,740,000, and 14,388,000, respectively, last year. This season's shipments consisted of 41,877 cars of wheat and 14,105 cars of other grains to the elevators and 11,147 cars of wheat and 3,948 of other grains shipped direct. The totals show 71,077 cars of grain this year and 48,379 last.

WASTE OF NATURAL GAS IN CANADA.

By W. J. D.

MUCH has been written about the saving effected by using natural gas in gas engines to generate power, instead of burning the gas under boilers to generate power from steam. Experiment has shown that the amount of gas required per hour, for the development of one horsepower, varies from 9 cu. ft., with the highest type of large internal combustion engine, to 130 cu. ft. with the ordinary steam engine. In other words, the efficiency of the gas is over fourteen times as great when used in gas engines as when used for generating steam under boilers.

It has also been suggested, in other countries, that provision be made for preventing the use of natural gas for such purposes as lime and brick burning, etc., in order to conserve this ideal and economic fuel for domestic and other less wasteful industrial purposes, for which, owing to its nature, it is especially useful.

Reckless Waste in Canada.

We, in Canada, need not at present consider the above refinements in the use of natural gas. Such a course, particularly in Western Canada, would seem like trying to stop a leak in the bung before "heading" the barrel.

Natural gas rights in the Provinces of Alberta, Saskatchewan, Manitoba and Northwest Territories are disposed of under Dominion laws. These laws make no provision for preventing the waste of natural gas, and the consequence is that considerable waste occurs. The importance of natural gas in Alberta may be realized when it is considered that a company is now piping it from Bow Island to Calgary, a distance of 175 miles. In addition to supplying Calgary, the company has branch lines to Lethbridge, MacLeod, Granum, Nanton, Claresholm, Brooks and Okotoks.

The province of Ontario has reduced the waste of natural gas to a minimum by causing all abandoned wells to be plugged and by levying a tax of two cents per thousand feet, with a rebate of 90 per cent. when the gas is used.

FORT WILLIAM.

FORT William lays claim to having secured during 1912 more manufacturing industries employing the greatest number of men than any other city in the Dominion of Canada. The particulars are as follows:—

Canadian C. & F. Co.	$1,500,000	1,600
Fort William Starch..	500,000	200
National Tube	400,000	150
McKellar Bedding ...	100,000	60
Great West Wire	100,000	60
Superior Brick	200,000	100
Mt. McKay Pressed..	100,000	50
Maritime Nail	700,000	250
Can. Steel Foundries.	250,000	250
Total cost of plants	$3,850,000	
Total number of men employed		2,720

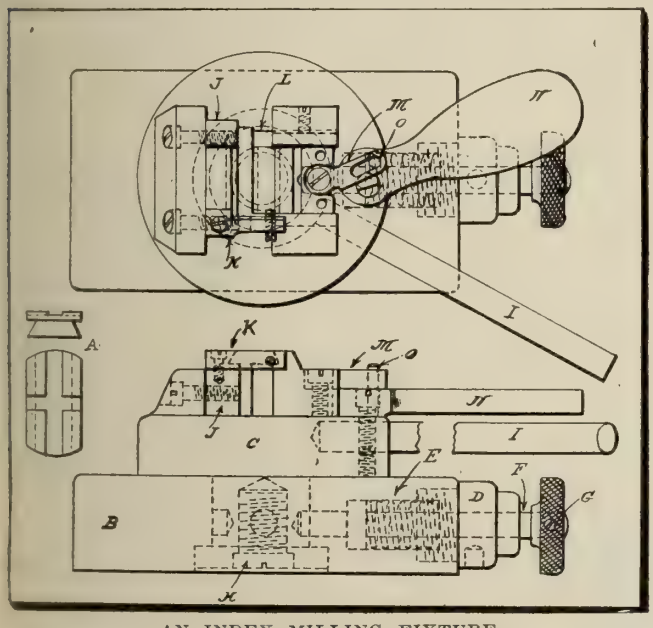
ONTARIO NATIONAL BRICK CO.

CONSTRUCTION of the works and plant of the new Ontario National Brick Co. is proceeding apace. Foundations for two of the three big kilns have already been completed, and the masonry erected a couple of feet above ground level. The same amount of work has been done on the machinery building, which is now ready for the steel. This steel is already on the way from Montreal, and it is now anticipated that the entire plant will be ready several days before the time specified.

Some three hundred men have been working on its construction during the past few weeks, and 300 more have been added recently. The Canadian Pacific Railway has run three spur tracks right into the works alongside of the three kilns, making it possible to load and ship bricks immediately they are dried. Construction of the gas plant is also well-advanced, and should be easily finished by May 1, at which time the company expects to commence operations.

The Ontario National Brick Co. is the new brick company organized a couple of months ago by interests closely connected with the National Brick Co., of La Prairie. The capital issued is $2,000,000 common stock, which is the full amount of authorization; and there have also been issued $1,250,000 40-year six per cent. first mortgage bonds. The board of directors is made up of the following gentlemen: J. N. Greenshields, K.C., Thos. Long, J. W. Pyke, Hon. Robt. MacKay, and John McKergow.

MACHINE SHOP METHODS AND DEVICES



Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

INDEX MILLING FIXTURE.

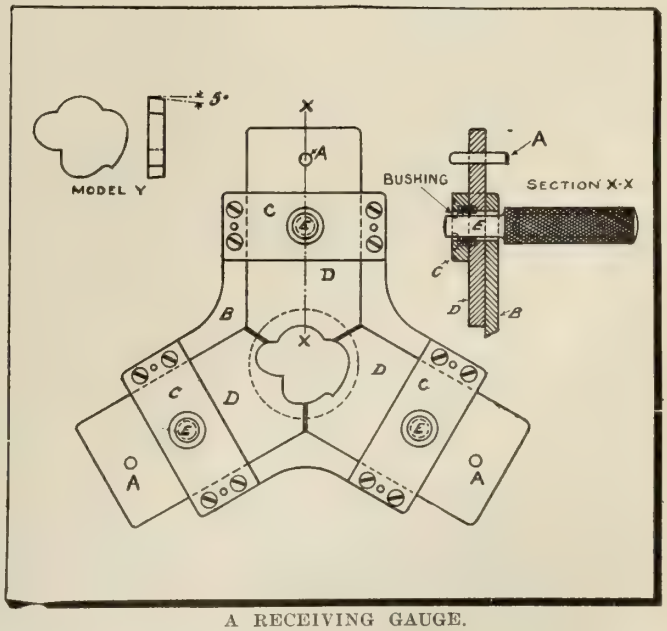
By A. L. Monrad.

IN THE illustration is shown the design of a milling fixture which had to have a number of cuts taken at different angles as indicated at (A). The base block (B) is machined all over. In its centre a 1-inch hole is bored to a turning fit for the jaw holder (C). On the end of the block is located a hardened screw bushing (D). On one end of this bushing is recessed a ½ inch hole for location of a spiral spring (E). Through the other end of the bushing slides a hardened, ground and lapped locating plug (F), with a knurled thumb handle on the end. This is secured to the plug with a centre screw (G). This plug enters into one of the four holes of the jaw-holder (C), serving to locate the position of the jaws when milling.

The end of the moveable jaw is the novel feature in the device. A cam was designed in such a way that it draws the jaw back and forth. A plate (M) is held on the movable jaw with a shoulder screw. In this plate is milled an elongated slot, just long enough for the cam handle (N) to draw up solid against the work. In so doing, the pin (O), which is driven in the cam handle, is free in the bottom of the slot. On the return of the cam lever the pin strikes the other end of the slot and draws the jaw back from the work. This fixture is placed on two parallels in a vise on a hand milling machine. By releasing the plug (F) from its index hole the jaw-holder is moved round to the next hole by the handle (I). The plug will locate itself in position as the point is slightly tapered to allow for wear and tear.

AN INDEX MILLING FIXTURE.

The holder is held in position with a T-head screw (H) and a washer. The shoulder is faced off to a turning fit and the jaw-holder (C) is revolved by the handle (I). On top of the holder is located one stationary and one movable jaw. The stationary jaw (J) is held in place with two fillister screws. On top of this jaw is secured a stop-plate (K) with an adjusting screw for setting the work in proper relation to the cutter. The moveable jaw (L) is bevelled on the sides to an angle of 15 degrees to form a sliding fit in the holder. A gib between it and the wall provides for adjustment.



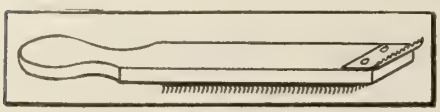
A RECEIVING GAUGE.

By A. L. Monrad.

THE illustration shows a receiving gauge for inspecting the model (Y), which forms part of a counting machine and is tapered 5 degrees on all sides. The making of this piece presents many difficulties, but it is still harder to gauge it accurately, as it has to be absolutely accurate all round, both as to shape and taper. The ordinary push receiving gauge answered the purpose fairly well, except that the inspector could never be sure of the correctness of the angle. When it comes to handling thousands of pieces it is very essential to have a gauge that the inspector can operate instantly and one that will absolutely assure him that all work passing through his department is in perfect shape.

In order to overcome the defects of previous designs the receiving gauge here shown was decided upon. It enables the inspector to see clear through and on both sides, so that he is assured of the proper angle. A very slight variation can be instantly detected. To relieve the inspector of the weight of the gauge, the latter may conveniently be placed upon a wooden stand before a window in such a way that one of the arms stands upright, as shown. At night an electric lamp is used.

The frame (B) is made of machinery steel, casehardened. It is lapped on the bottom and both sides to a true surface. At the centre of the frame a hole is bored a little larger than the diameter of the work to be gauged, in order to let the light through. This hole is shown by the dotted circle. On top of the frame (B) the plates (C) are secured by four fillister-headed screws and two dowel pins in each. These plates are also casehardened and lapped to a true surface on their bottom side. The slides (D) are lapped on all four sides to a push fit in the frame, and, like the latter, are of casehardened machinery steel. The pins (A) are used as a handle to slide (D) to and fro. These slides are held in position by hardened ground and lapped plugs (E) and bushings, as shown by the



A RECEIVING GAUGE.

section X.X. If any plug refuses to enter when the work is inspected, the amount of error in the piece is easily ascertained by the removal of one of the plugs.

A FILE-CARD ATTACHMENT.

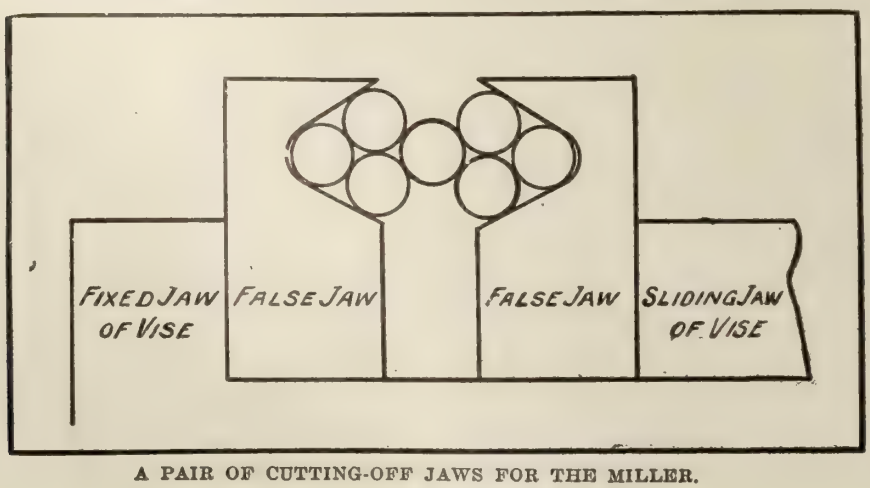
By J. E. Cooley.

WHEN a file becomes clogged up with steel or brass chips, the latter often become so tightly wedged between the teeth, especially in the case of smooth files, that a file-card will not remove them, and one has to resort to the use

FILE CARD ATTACHMENT.

of a sharp-pointed instrument of some kind to force out the chips from each tooth separately.

The accompanying sketch shows a device for this purpose. It consists of a piece of sheet steel having teeth filed on its turned up edge. This is fastened to the back of the file-card and saves handling a separate tool when cleaning a file. It is of course used by simply turning over the file-card and cleaning several teeth simultaneously.



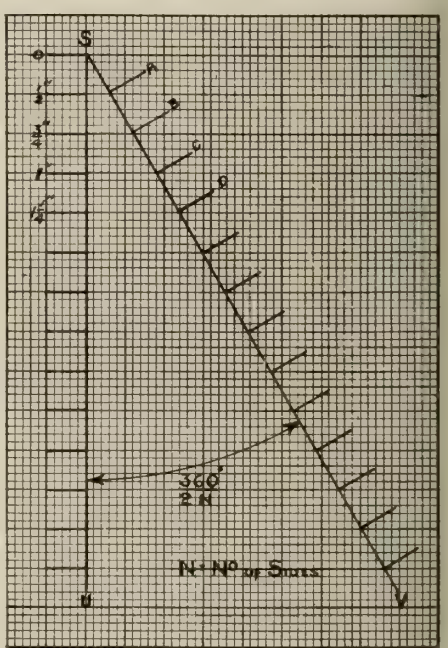
A PAIR OF CUTTING-OFF JAWS.

By D. A. Hampson.

WE at one time received an order for some metal specialties for printers' use, part of which consisted of 5,000 pieces of ½-inch round stock. Half of these were to be of cold rolled steel and half of steel tubing 1-16 inch thick. The length of each piece was to be exactly 1 inch, and the ends had to be square. The people for whom the work was being done were to afterwards own any special tools or fixtures found necessary for turning out the pieces, but naturally wished this item of expense kept as low as possible. We had a full equipment of milling machines and plenty of cutters up to 4 inches diameter; so it became a question of how many parts could be severed at one cut of the machine.

Jaws to hold the work were planed up from a piece of steel 1¼ x 2½ x 14 inches, and at what was to be the top, a V-groove was cut with 30-degree sides. This piece was cut in two and bolted to the cast-iron jaws of the miller vise, as seen in the sketch. Seven bars of stock were put in the vise, and thus, with four milling cutters on the arbor, we got an output of twenty-one pieces per cut. While increasing the number of cutters would have apparently increased the output, there would have been a longer wait between cuts while the operator was removing the work and cleaning out the vise. During cuts the operator burred up his work. The sketch clearly shows how tightening the vise securely gripped all the seven pieces, and no trouble was experienced from loose bars. Needless to say, the false jaws had to be tightly bolted to the vise, and the sliding jaw of the latter had to be well gibbed.

The above method of working may be cited as an example of a policy we always followed, and which might be roughly set forth as:—"Three pieces complete are better than four partly finished." Except on long runs of the same piece, we found this policy to pay. Instead of "tearing" the work through the machine, making a fine numerical showing, but accumulating piles of unburred and uncleaned work, we set the machine to a point where the operator could, by hustling, just keep his work dressed up and keep the machine cutting during the greatest number of minutes per hour. In this way the pieces were all cleaned up and ready for subsequent operations without having to pass through the hands of bench workers,—an item to be considered, especially when the shop is short of help.



A PAIR OF CUTTING-OFF JAWS FOR THE MILLER.

SIZES ACROSS FLATS AND CORNERS.

By E. W. Tate.

ILLUSTRATED herewith is a method which a draftsman, or in fact any mechanic, will find to be useful. If the distance across flats is given, it is quite bothersome to calculate the distance across corners, or resort to a table, which is not always at hand. The machinist may wish to know the circle to lay out that a given piece of hexagon stock will pass through or the draftsman may wish to specify the diameter to which to turn a piece in order that it may be milled to a given hexagon. The line cut shown is laid out for hexagonal work.

The line (S. U.) represents one-half the distance across flats, and (S. V.) represents one half the distance across corners. Assume that it is required to lay

SIZES ACROSS FLATS AND CORNERS.

out a hole that a piece of 1¼- inch hexagon stock will just slide through. Locate the line marked 1¼ and project a line perpendicular to (S.U.) and the point (D), where it intersects (S.V.) will give the required radius, with the point (S) as a centre.

These diagrams should be laid out on cross section paper and mounted on Bristol board to preserve them. For ordinary work, not more than two diagrams will be found necessary, one for hexagonal and one for square stock. The time saved by their use will be surprising.

PIPE BENDING DEVICE.

By E. W. Tate.

HAVING a considerable quantity of brass piping to bend to the shape shown at (B) Fig. 1, we decided to

make the machine (A) Fig. 2. This consisted of a cast iron wheel (C), grooved to suit the outside diameter of the pipe (B). A wrought iron forked lever (D) was made, and two cold rolled pins (E)

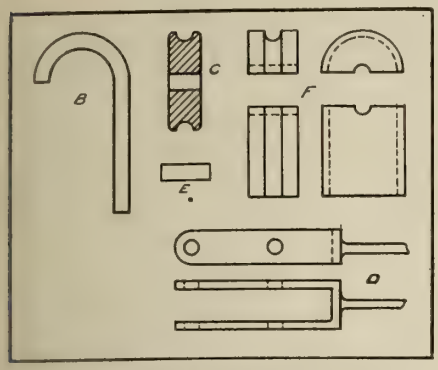


FIG. 1. PIPE BENDING DEVICE.

formed the spindle of wheel (C) and the fulcrum of lever (D). The hardwood block (E) was made in two pieces, the semi-circular portion being turned separately and afterwards fastened to the larger part.

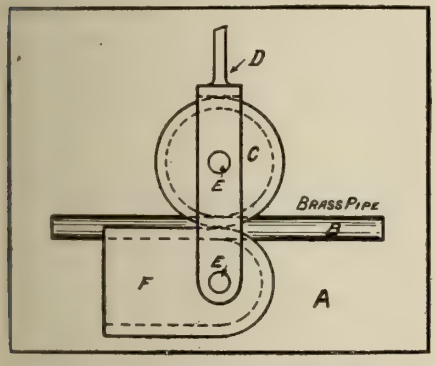

FIG. 2. PIPE BENDING DEVICE.

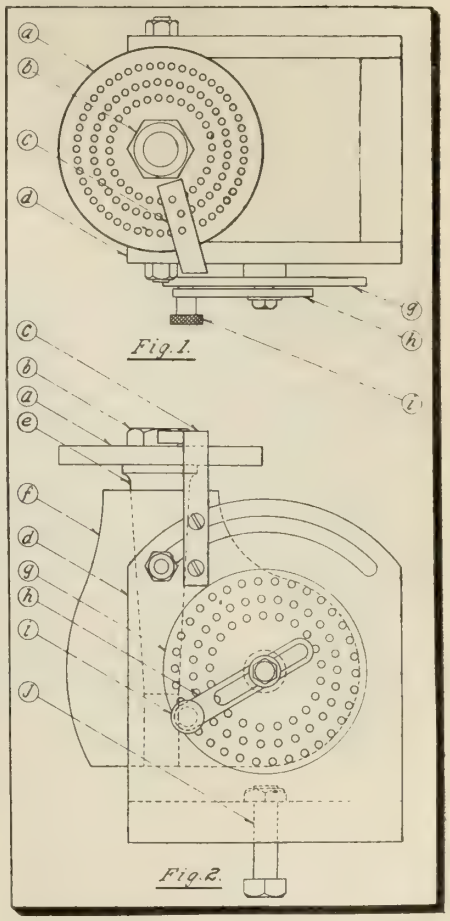
The method of usage is shown by Fig. 2. The pipe (B) and hardwood block (F) are secured in a vise. Pressure is applied through the lever (D) and the pipe is thus bent to the desired shape. This device has proved very satisfactory and the same arrangement could doubtless be used in other shops to advantage.

A LATHE TRUCK.

By Avery E. Granville.



THE Le Blond Machine Tool Co., Cincinnati, Ohio, use the truck shown in the accompanying halftone to move finished or partly finished lathes from place to place in their factory. The body of the truck is of cast steel with two heavy 14-in. cast iron wheels placed on a steel axle in the middle. A 6-in. wheel is carried in a swivel at each end, these wheels being set high enough above the middle wheels to insure only three wheels being on the floor at one time.

The lathe to be raised and moved, is elevated by means of three cut steel screws, the nuts for which have sprocket teeth cut on the outside, so that they may all be connected together by a bicycle chain, and all worked in unison. Two of these screws carry one of the cross-pieces, there being one at each end, so that the lathe is held steady with no tendency to tip. The third screw is set in the middle of the cross-piece it carries, and the nut on it not only has sprocket teeth like the others, but also has bevel gear teeth cut on its lower side into which the teeth of a bevel pinion mesh. This pinion is carried on a small shaft having a crank at one end, so that a workman can easily run the screws up or down by turning the handle. Only a few seconds are required to run this truck under a lathe, run up the screws till the lathe is well off the floor and then push it wherever desired. For light lathes, only one man is needed to do the work, but, if the lathe is a heavy one, two or more are required. This device is the quickest operated and saves more time than any the writer has seen.

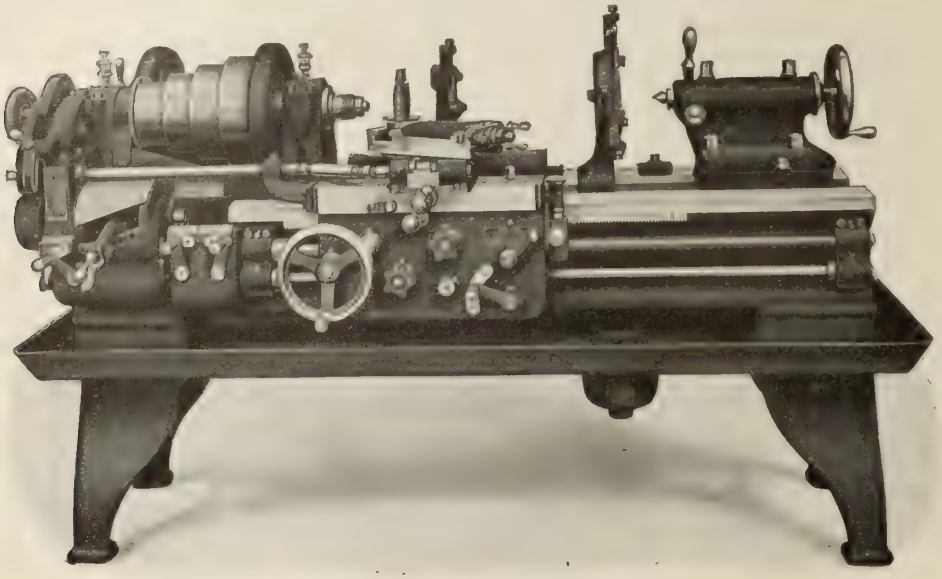
A DIVIDING HEAD AS A DRILL JIG.

By J. H. R.

THE accompanying sketch illustrates a useful means of using an old dividing head as a jig for the drilling machine. The cut shows the jig being used for drilling a series of equidistant holes on concentric circles in a perforating die. The work arbor (e) is fitted to the hole in the dividing head and its upper end is made to suit the requirements of the work in hand,—in this case, the round steel disc as shown at (a). The gauge (c) is secured to the body of the head (d) and overhangs the die-plate, as shown in Fig. 1. Holes are drilled in the piece (c) to conform with the required radii of the different rows of

DIVIDING HEAD AS A DRILLING JIG.

holes. By the ordinary method of division with the use of the spacing crank (h) and disc (g) the holes in the die (a) are spaced equidistant and in concentric circles.



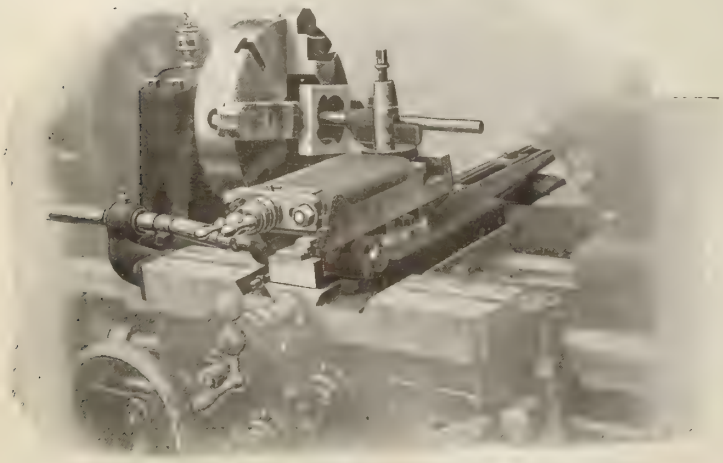
A LATHE TRUCK.

DEVELOPMENTS IN MACHINERY

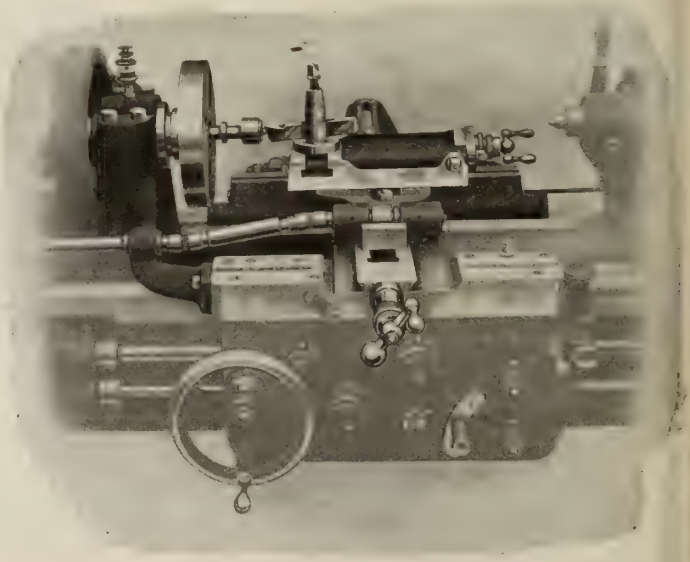
A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

HIGH DUTY TOOL ROOM LATHE.

THE tool room lathe which we here illustrate is a recent design of the American Tool Works Company, Cincinnati, Ohio, and is built in 14-inch, 16-inch, 18-inch and 20-inch sizes. In its general features this lathe is similar to the regular "American" high duty engine lathe with patented drop vee bed, double plate apron patented quick change mechanism, etc.



HIGH DUTY TOOL ROOM LATHE.



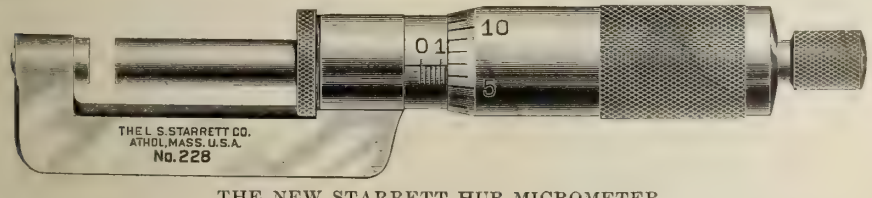
The chief interest in a tool room lathe centres in the various attachments such as taper, draw-in and relieving attachments. In the lathe under review these have all been designed with a view to efficiency and ease of operation. The taper attachment is constructed to avoid the spring and inconvenience sometimes found in such a device. All parts are amply heavy and numerous sliding joints have been avoided, thus insuring a rigid mechanism producing accurate tapers. It is bolted to the carriage and can be thrown into operation at any point along the lathe bed by tightening a single nut. When attached for taper work, the sliding shoe is directly connected with the bottom slide of the tool rest by a heavy cast-iron yoke, making its operation instantaneous, and at the same time doing away with all lost motion, weakness and inaccuracy liable to be found in taper attachments directly connected with the cross feed screw. The cross feed nut is always connected with the tool rest, so that it cannot fall to one side and out of position.

The "American" relieving attachment has been designed along original lines with a view to making it completely universal in its operation. The result is that end and internal relieving can be readily performed as straight relieving work, such as relieving taps, hobs, cutters, etc. An important feature of this new attachment is that it can be applied to any type of "American" high duty lathe and is not limited to one special type or size. Thus, it can be as easily applied to a lathe with a geared head or a motor drive as it can to one with a cone head drive.

The change gear mechanism is supported by a bracket located at the front of the headstock on top of the quick change gear box. The gear train has a small quadrant which carries the change gears, and which is used to disengage the drive when not required. Power is taken from a spur gear located on the end of the spindle and is transmitted through the change gear mechanism to the driving shaft which extends through the supporting bracket on the quick change gear box and is journaled at the other end in a suitable bracket fastened to the left wing of the carriage. Between this bracket and the tool rest are located the universal or knuckle joints which permit cross movement to the tool slide.

INTERNAL RELIEF, HIGH DUTY TOOL ROOM LATHE.

END RELIEF, HIGH DUTY TOOL ROOM LATHE.



The driving shaft revolves constantly in one direction until the direction of the spindle rotation is reversed, at which time the driving shaft ceases to reciprocate the tool slide. This feature is of great value, for by means of it the tool side will remain stationary when the direction of the carriage travel is reversed while the half nuts are engaged. By means of this same feature the tool can be withdrawn from the work and run back for a new cut, as is the practice in tap and hob making, without any waste motion of the parts and with absolute safety to the cams.

Another valuable feature of the attachment is that which permits the tool slide to be operated at every 30 degrees, thus giving twelve operating positions within a circle. It is this feature that permits of relieving side cutters, end mills and numerous similar jobs. When necessary to relieve taps or hobs having spiral flutes, the attachment can be arranged to handle such work by the addition of extra gears.

This tool room lathe is also fitted with a draw-in attachment of simple design, equipped with collets for holding stock up to 7/8-inch diameter on the 14-inch and 16-inch sizes. and up to 1-inch diameter on the two larger sizes.

THE NEW STARRETT HUB MICROMETER.

UNTIL recently the only method of measuring hub thicknesses has been to lay a straight edge on one side of the hub and put a steel rule through the bore, reading the thickness on the opposite side from the straight edge. Sometimes, if the total diameter of the wheel or gear was small, a pair of calipers was slipped over and the thickness of the hub calipered in the usual manner.

THE NEW STARRETT HUB MICROMETER.

The new Starrett micrometer, here shown, does away with liability of error common with the rule or caliper method, because the measurement is made direct, and the micrometer reading insures absolute accuracy. The chief feature of this micrometer is the frame, which instead of flaring out in a semicircular form, as do ordinary micrometers, is offset only slightly from the centre line of the spindle. By making the frame narrow, it may be easily inserted in holes as small as 3/4-inch diameter.

The new micrometer has the combined speeded thumb piece and ratchet stop that have been a feature of other Starrett micrometers, and it also has the lock nut. The speeded thumb piece gives a much smaller periphery for the thumb to turn, which greatly increases the speed with which the micrometer may be set. The thumb piece is also a ratchet which acts as soon as a slight pressure has been applied to the work being measured. This prevents excessive pressure being applied to the work as would be easily possible with a micrometer screw, which has 40 threads per inch. The lock nut is useful to make a gauge of the micrometer, as when a large number of pieces must be made to a certain size.

AN HYDRAULIC BULLDOZER.

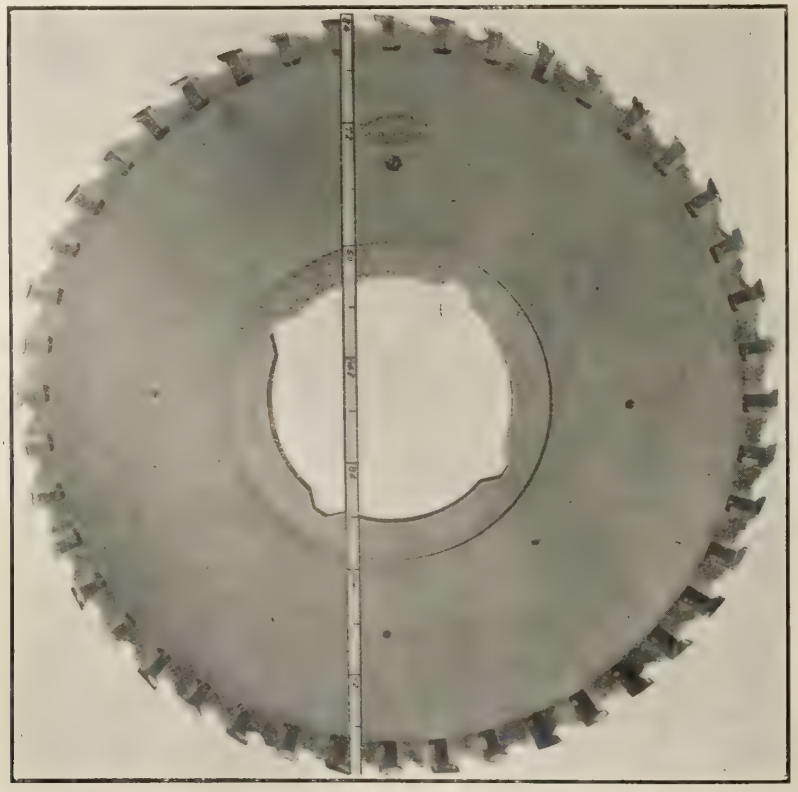
THIS machine was recently designed by the Watson-Stillman Company, New York, for manufacturers of heavy axles for automobile trucks, but it may also be used for upsetting or shaping heavy forgings for die press work. For example, a round or square steel bar which is to be upset or split at one end and then shaped to the required form, is put on the bed plate with the other end against the heavy upright beam shown at the extreme left. A slot, provided in the rigid cross beam between the two middle stiffening ribs but not clearly visible in the cut, is large enough to handle almost any size of bar or shape up to or beyond the full capacity of the machine. The upright stop on the left is then adjusted to the correct position by means of the nuts on the two horizontal rods. The correct position of this beam is determined by the length of bar that must project onto the bed plate clear of the face of the rigid cross beam.

A forming die, a cutter, or whatever is needed to give the bar its initial cut or shape is rigidly attached to the moving crossbeam, the face of which is shown in the cut. The four vertical Tee slots in the moving cross beam furnish ample means for attaching dies. A forming or holding die is also placed against the fixed cross beam to guide or shape the operation. Where many pieces of the same size must be formed, the die is not removed until all pieces are ready for another operation if needed.

AN HYDRAULIC BULLDOZER.

A notable feature of the machine is the arrangement of its three rams, all connected to the one head to permit the use of only one, or two, or of all three rams, depending on the pressure necessary. With one ram—the middle one—the capacity of the bulldozer is 56 tons; with the two outside rams, 127 tons; and with the three cylinders in use simultaneously the capacity becomes 200 tons. Stop valves, shown in the piping at the rear, are used for cutting out the cylinders.

The press is completely controlled by the vertical latch lever shown, which operates a 2-inch balanced two-spindle valve. A 5-inch pullback cylinder, not shown, is constantly under pressure to return the moving cross beam to its initial position as soon as the rams are released. The stroke of the rams is limited to 15 inches by positive stops which are strong enough to take up the full pressure. These stops serve as safety devices in preventing excessive upsetting on certain forgings. To allow for eccentric loads on the moving cross beam an equalizing device consisting of two racks and two pinions is provided to insure absolutely parallel motion. One pinion and one rack of this device are shown in the picture.

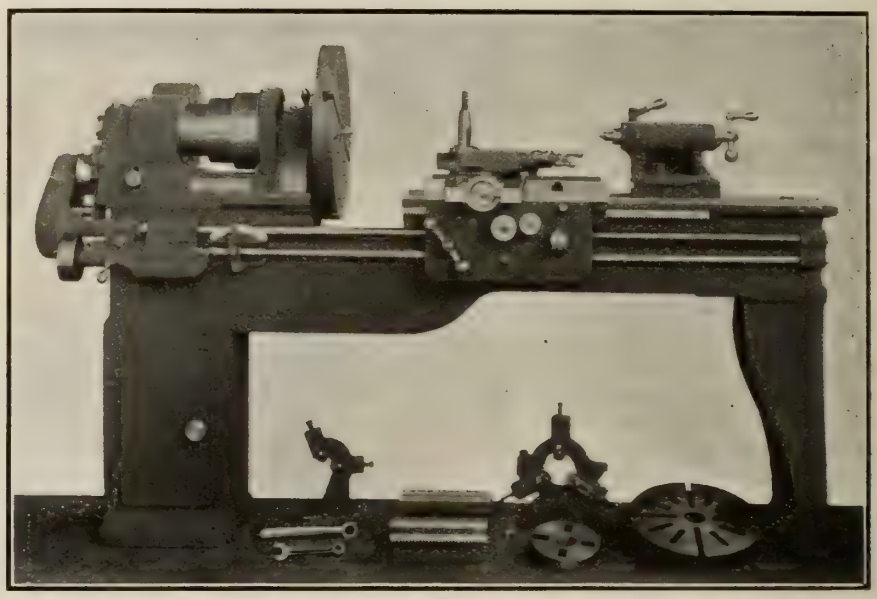


The following are the principal dimensions: The width of the head plate is 44 inches; maximum opening between

moving cross beam and rigid cross beam, 48 inches; maximum opening between moving cross beams and adjustable stop, 90 inches; length of moving cross beam, 48 inches; diameter of rams, 11 inches; stroke, 15 inches; maximum liquid pressure per square inch, 1,500 pounds; diameter of horizontal extension bolt, 6 inches. The weight of the complete machine is 20,000 pounds.

INSERTED TOOTH METAL CUTTING SAW BLADES.

THE Hunter Saw & Machine Co., Pittsburg, Pa., have recently manufactured two of the largest inserted tooth metal cutting saw blades ever placed on the market. These are known under the trade name of "Hunter Duplex." They are 84 inches in diameter, being made from 1 inch thick plates of the company's own special analysis, and treated to withstand the greatest strain. Two collars, one on each side, 26 inches in diameter by 1 inch thick, are riveted to the body of the saw, and are milled with four equally spaced keyways by which the blades are driven. The plates are milled with forty-four pockets into which are inserted roughing and finishing teeth alternately, weighing 1¾ pounds each, and made of the best grade of high speed steel known for metal cutting. Each tooth is reinforced and held rigidly by a tool steel wedge, weighing ¾ pounds, inserted at the back of the tooth. At the bottom of the pockets, the plate is drilled and tapped to admit of a hexagon head brass screw, which is used in setting the teeth to the proper height.



The blades weigh 2,000 pounds each, are driven by 75 h.p. motors, and were designed for cutting 40 inch ingots. They are capable of cutting 24 inch ingots in ten minutes.

INSERTED TOOTH METAL CUTTING SAW BLADES.

WILLARD GAP BED ENGINE LATHE.

THE gap lathe here shown is a production of the Willard Machine & Tool Co., Cincinnati, Ohio, and is designed and built to serve the double purpose of the jobbing as well as the manufacturing shop. It will swing 13½ inches over the shears, and will take work 21 inches diameter by 6½ inches face in the gap.

WILLARD GAP BED ENGINE LATHE.

The crank handle for moving the carriage is at the left hand side of apron, which is unusual in gap bed lathes, as this handle is generally placed at the right hand end of apron, a location more or less inconvenient for the operator. A gib is attached to the carriage at the right hand side of the apron for the purpose of stiffening the carriage when it overhangs the gap. The removable filling piece is scraped and fitted to a bearing in the gap, and when in position transposes the lathe into a regular standard engine lathe equally as convenient for all ordinary work as the regular standard engine lathe. The headstock and tailstock of this lathe are identical to headstock and tailstock of the firm's standard 13-inch lathe, while bed, apron and carriage have had to be changed a little in order to accommodate the gap. This gap bed lathe is furnished in 6, 7, 8 and 10 feet beds, and has a cabinet leg under the headstock end. A cabinet leg for the tailstock end can also be furnished, but the regular outfit has a plain leg under the tailstock end.

NEW MOTOR CAR FUEL WANTED.

A PRIZE of $100,000, to be contributed by all the chief motor car clubs in the world, is to be offered, says Excelsior, for a new motor car fuel, rendered necessary by the rapidly increasing price of petrol. The new fuel must be easy to manufacture with substances of which there is a constant supply, such as alcohol, and which are not likely to fluctuate in price except with general alterations in money values.

THE BLAIR REMOVABLE SLAG POCKET.

IN the usual operation of the open-hearth furnace, the filling of the slag pockets with slag necessitates the periodical stopping of production for the purpose of cleaning these out. In addition to this cleaning being destructive of the brick work of the pockets, the necessary interruption to the operation of the furnace adds to the tonnage cost of the steel produced. Attempts have been made to overcome the difficulty by providing slag-collecting receptacles inside the permanent walls of the furnace structure, and replacing them when filled by empty vessels; but these attempts have been failures, because the slag adheres to the walls of the furnace and the receptacles cannot be removed without serious damage to these walls. Moreover, men cannot work in the slag pockets, owing to the high temperature.

The illustrations herewith show a removable slag pocket designed by the Blair Engineering Co., New York and Montreal. This pocket forms a removable portion or section of the furnace structure, and may be readily and comparatively speaking, quickly removed when filled, being then replaced by an empty pocket. Fig. 1 shows a longitudinal vertical section of one of the two similar ends of a 60-ton basic open-hearth furnace provided with this pocket, and Fig. 2 is cross-sectional view. As the cuts clearly show, the slag pocket structure, apart from the arches and arch supports, is complete in itself and is quite separate from the remainder of the furnace. It consists, preferably, of a wheeled truck or carriage, moving on a track at each end of the furnace. Rising at intervals from the bed of the carriage are a number of metal posts, suitably braced, to provide a framework for the brick walls forming the slag posts. The lower ends of the port down-takes are provided with suitable metal binders for supporting the slag pocket arches at this point, so that the arches are entirely separate from the slag pocket walls and are not dependent on the latter for support. When a slag pocket carriage is run into position there is necessarily left a narrow opening between the upper ends of the pocket walls and the down-take walls, and a similar opening between the wall of the flue leading to the regenerative chambers and the adjacent wall of the pocket structure. These spaces are temporarily closed by brickwork to form tight joints connecting the slag pockets with the port down-takes and with the regenerative chambers.

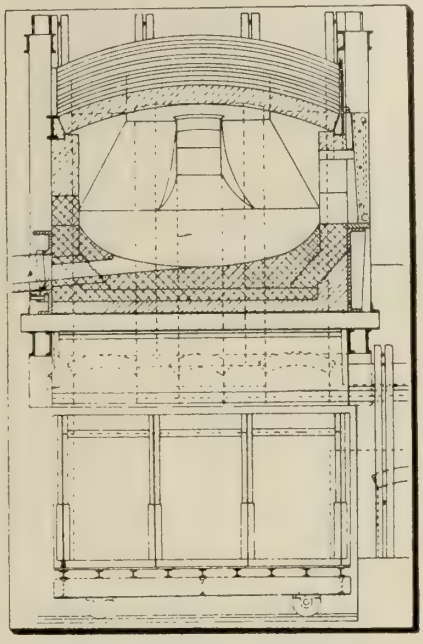

FIG. 2. CROSS SECTION OF 60-TON BASIC OPEN HEARTH FURNACE, SHOWING SLAG POCKET CARRIAGE.

When the slag pockets are full, the jointing bricks are knocked in to destroy the bond between the pocket walls and the permanent furnace walls, but no part of the furnace structure is disturbed in any way. The slag pocket carriage is then withdrawn on its rails and replaced by an empty one, the spaces being bricked up again as before.

Instead of being made up with bricks, the joint may be made by placing a layer of ganister on top of the slag pocket walls and raising the whole pocket tight up against the upper walls by means of four screws at the corners of the carriage, and by blocking in position by means of wedges or supports at the bottom of the carriage. Screws are simpler and better for the purpose than an hydraulic ram, since the lift only amounts to an inch or two, and the operation only takes place once in two or three months.

Hitherto the time taken for the removal of the slag and the rebuilding of the slag pockets and down takes has been from a week to ten days, with the attendant loss of product and that due to the necessary expenditure of a very considerable amount of labor and fuel to bring the furnace back to melting temperature. A Blair removable slag pocket, on the contrary, may be withdrawn and an empty one substituted in a few hours, enabling a large portion of the heat of the furnace to be re-

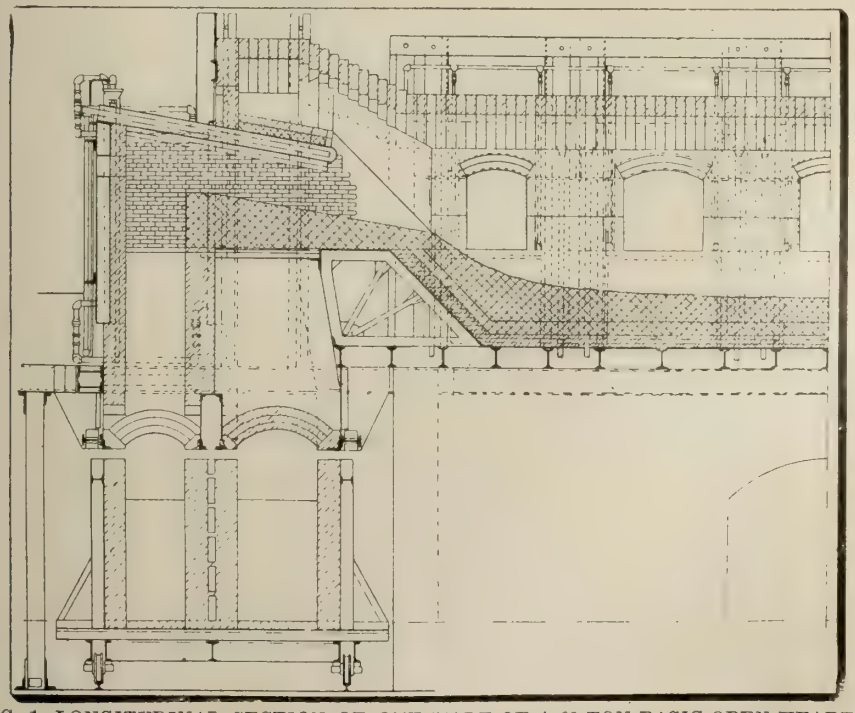

FIG. 1. LONGITUDINAL SECTION OF ONE-HALF OF A 60-TON BASIC OPEN-HEARTH FURNACE FITTED WITH BLAIR REMOVABLE SLAG POCKETS AND INDESTRUCTIBLE PORTS.

tained and normal working conditions restored with a minimum of delay and expenditure of fuel. If the time selected for the removal of the slag pockets be made to coincide with the operation of burning out of the flues, the loss of time due to the removal of the pockets is nil.

The furnace shown in these illustrations is also equipped with the Blair patented port and bulkhead. The most prominent feature of the Blair port invention consists of a hollow water-cooled steel hood, which covers full width and length of the gas port of an open-hearth furnace, permitting the entire blocks of the furnace to be built of magnesite in a basic furnace, and of silica sand in an acid furnace. It forms a septum or barrier, between the incoming gas and air, impervious to the gases and physically and chemically inert, so that the whole end structure of the furnace becomes practically indestructible. Then, too, the hood, by properly controlling the mixture and direction of the gases at all times, greatly retards the burning out of the furnace.

The bulkhead, as shown in the illustrations, consists of a hollow steel water-cooled box, lined on its inner side with magnesite brick, thus insulating the bulkhead cooler from direct contact with the flame. In conjunction with the Blair port this is an additional source of saving, as it eliminates the constant bulkhead repairs necessary where brick alone is used.

Some of the advantages of these inventions, as proved by numerous installations in the United States, and at the plant of the Nova Scotia Steel & Coal Company, North Sydney, N.S., are that an indestructible port, and end block is obtained. As the Blair port is said to always maintain its original alignment, perfect control and direction of the gas is obtained at all times, the life of other parts of the furnace being thereby much increased with consequent reduction of furnace repairs. As there is no silica brick in the end of the furnace to melt down and cut the magnesite bottom, there naturally also follows a material reduction in the cost of bottom repairs. It has been further demonstrated that the port will withstand a temperature on the outgoing end which would destroy a port built in the ordinary way, thereby enabling the furnace to run hotter with a marked gain in the speed of production. Blair ports are to be found in some fifteen of the largest steel plants in the United States. Five of these, including that of the Bethlehem Steel Company, have the whole of the open-hearth furnaces so equipped.

The Blair port patents are owned by the Blair Engineering Company of Canada, Ltd., 74 Bank of Ottawa Building, Montreal, who have installed these ports in all three of the furnaces of the Nova Scotia Steel and Coal Company, Ltd., North Sydney, N.S. The latter company will also equip a fourth furnace, which they contemplate building, with Blair ports.

CANADA FORGE CO. REBUILDING.

THE Canada Forge Co., Ltd., Welland, Ont., are rushing to completion a temporary building to replace the one burned on Sunday, February 2, and will have a part of their forge department in operation within a week. This will enable them to care for the delivery requirements of their many customers. The contract for the new forge shop has been placed with the Standard Steel Construction Co., and is specially designed for the manufacture of forgings up to 40,000 pounds in weight. The general dimensions of this building will be 100ft. x 200 ft., with centre bay equipped with 20-ton electric crane of 60ft. span, with two bays each to be served with 5-ton electric crane, 20ft. span. At the end of this building and continuing a distance of 100ft. there will be constructed a 50ft. span electric crane runway of 20-ton capacity for handling raw materials and shipping. This will not only insure against further interruptions in production on account of fire, but will greatly increase the scope of the work. Equipped as it will be with steam hammers, hydraulic forging presses, annealing and heat treating furnaces, this forge will be one of the finest on this continent.

STEEL PLANTS AND TARIFF PROSPECTS.

THERE has been a great deal of curiosity at Ottawa as to whether the budget speech when it is brought down late in this month or early in March will contain any concessions to the steel interests. Following the example of his predecessors, Hon. W. T. White, the Finance Minister, is keeping his own advice, and it is not likely anything will definitely be known as to the policy of the government until he makes his announcement. The steel men have made several pilgrimages to Ottawa to lay their claims before the Government, and it is understood that they have asked either for increased duty or for a commission of some kind to investigate their claims. The request for a return to the bounty system, it is said, has been abandoned, and there is general impression at Ottawa that the present rate of duty will prevail for another year. There is undoubtedly a strong radical wing in the Conservative party, consisting mainly of Ontario and Western members representing rural ridings, who are opposed to further concessions to the steel interests. They point out that the mills are so busy at present that they are unable to take care of the Canadian business.

Some Inside History.

In view of the revival of the question of a higher duty, a little history as it is told at Ottawa is interesting. It is said that the Government last session, decided to renew the steel bounties for another year pending the appointment of a tariff commission which would make a thorough investigation. The decision of the Government was laid before the Conservative caucus and then the fun began. Arthur Meighen, the clever young member from Portage la Prairie, is credited with being the leader of the insurgents and the objection was so determined and so vigorous that the matter was dropped. Now these same objectors have not, according to their statements, freely made in the lobbies, changed their views in regard to the steel question and the government is well aware of the fact, therefore, no matter what its own views, it has to reckon with this radical element. The general opinion is that in view of all these circumstances the steel men will have to be content with the status quo. If a tariff commission is ever appointed —and there is a strange silence on the subject—the steel men can then make their representations to it.

A side-light on this same question is a rumor to the effect that the United States Steel Corporation were given to understand that if they wanted to do business in Canada, they must build a Canadian factory, hence the announcement of their new Sandwich plant. Otherwise, the tariff would be adjusted so that they would have to get out of the market. With the United States Steel Corporation operating in Canada on an even basis with other Canadian concerns, many of the objections of the Eastern companies would be removed, as it was the alleged dumping in Canada which was their strongest argument for a higher duty.

ENGINE MAKERS ASSIGN.

THE Sherman-Cooper Co., Ltd., of Toronto, have made an assignment to Mr. Osler Wade, assignee. The company are manufacturers of gasoline engines chiefly, and their plant is situated at No. 1011 Eastern avenue. The assets and liabilities are not known as yet, and are to be determined at a meeting of the creditors, shortly.

FOUNDRY CONVEYER SYSTEM.

THE Massey-Harris Co., Ltd., of Toronto, Ont., have installed a system of conveyers, one of which carries coke to an upper run, from which it discharges to a belt conveyer serving the east cupolas, or into a hopper serving the charging cars of the west cupolas.

This conveyer-elevator has a horizontal run of 20 feet. Coke is delivered to it through a hopper at the base, whence it is raised to the upper run. It consists of "V"-shaped buckets carried on steel or malleable chains, and rigidly attached to the links. These buckets are upright on the ascending run, but on the horizontal run, they push the coke along in a steel or concrete trough, so that by opening a gate in the bottom, the material may be discharged.

Figure 1 shows the buckets in the act of pushing the coke towards the belt conveyer. The latter is 18 ins. wide, 350 feet between centres, and runs horizontally along the top of the building. For the greater part of its length, delivery is made into a chute serving the cupola charging cars.

Conveyer in the Basement.

A conveyer independent of the other two is located in the basement of the foundry, and is seen in Fig. 2. It delivers sand, coke, and broken stone from the track hopper into several of the storage bins. This is also an 18-inch belt conveyer, 50 feet between centres, driven at the tail end from a five-horse power motor suspended from the ceiling.

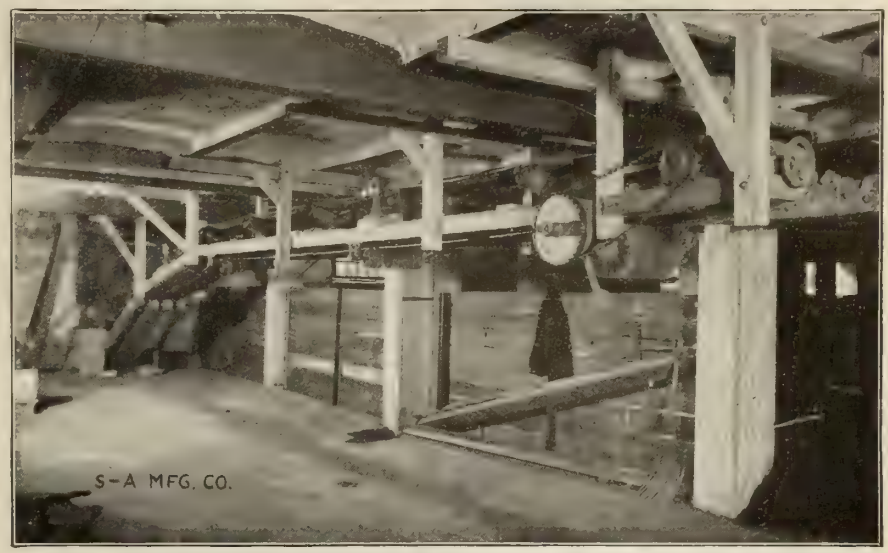

FIG. 2. CONVEYER IN BASEMENT.

This motor also drives the 24-inch, 13-foot apron feeder, which is located on the other side of the basement wall beneath a 12-foot track hopper.

At the head end of the conveyer is located a rotary cleaning brush, which cleans the return belt, removing the fine sand and the coke dust, preventing their accumulation on the return carriers and keeping the different materials carried from becoming mixed one with the other. This cleaning brush is a standard arrangement, and is always located at the head end of the conveyer directly back of the head pulley. It is driven from a sprocket on the head shaft. The mechanism is self-contained and dust-proof, and may be applied to any size brush or any size of conveyer. A web sprocket is used, cast integral with an internal gear, which meshes with a pinion on the brush shaft. An adjustable weighted lever arm provides the proper tension for the brush against the belt, and automatically takes up the slack as the brush wears down.

This conveyer system, consisting of four conveyers, was manufactured by the Stephens-Adamson Mfg. Co., to meet the special requirements of the Massey-Haris Co. The entire equipment was designed by Mr. Edwin J. Banfield, 120 Adelaide St., West, Toronto, who is the special representative of the Stephens-Adamson Mfg. Co. in Ontario.

FIG. 1. CONVEYER-ELEVATOR AND BELT CONVEYER.

CANADIAN CIVIL ENGINEERS.

THE following officers were elected for the ensuing year at the concluding session of the Canadian Society of Civil Engineers at Montreal, Jan. 30: President, Phelps Johnson, Montreal; Vice-President, F. C. Gamble, of Victoria, B.C.; Members of Council, Messrs. J. M. F. Fairbairn, W. J. Francis and R. J. Durley, Montreal; F. A. Bowman, Halifax; W. D. Baillairge, Quebec; S. J. Chapleau, Ottawa; H. G. T. Haultain, Toronto; W. A. Duff, Winnipeg, and T. H. White, Vancouver.

COMPETITION FOR NEW INDUSTRIES.

IT is not an uncommon thing nowadays to see from the newspapers that small towns like Sloshville have just secured a new industry, owing to the enterprise displayed by their board of trade; the report generally adding, that great credit is due. How did they manage it? Usually it runs this way:—"The town will make the new concern a loan of $50,000 for fifteen years, together with whole or partial tax exemption, and will give them a free site of twelve acres. In return, the company agrees to spend probably the above sum on their factory, which will employ 60 men this year, 75 next year, and 100 the next. These latter, adds the Sloshville "Intelligencer," will be new citizens. Almost every other town of any size in the province has been competing with Sloshville to obtain this splendid new industry. The press in the various towns have noted it a sure thing, as the offer made by their particular city council has been so liberal, it could not be ignored. After all, Sloshville got it, because it made the highest bid."

What is the result of this mad competition for new industries? Small towns are crippling themselves for years to come in their efforts to add a few hundred souls to their population, and are putting themselves in a position to be unable to give justice to any new industry that might wish to locate there. Sloshville, by giving a free site, is setting a standard which other towns must come up to, and has given partial exemption from taxation, which the next concern that comes along will demand with equal justice.

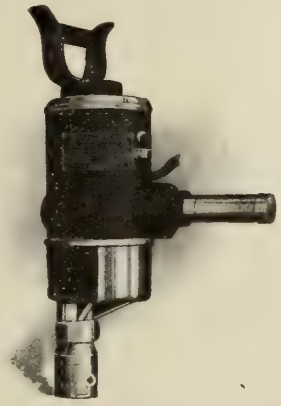
The case of an Ontario town is interesting. Its council invited some capitalists to build their plant within its limits, and gave certain concessions. The capitalists spent all their capital on the new factory, and when they were through, the town had to submit a by-law to the people to supply money for running expenses. This happened only a week ago

Canada has acquired such a fame for free sites and exemption from taxation, that British and American capitalists come here, and literally hold-up the ambitious cities one after another, until they have obtained the greatest possible privileges from each, after which they decide to locate. This is particularly true of Western Ontario and the provinces farther west. In the East, conditions are a little different. An American firm recently wrote to the city council of Maisonneuve, Que. (a city which is as hot after industries as any in Canada), and promised to locate within its bounds if they were offered a free site. The application was read at the council meeting, and received with laughter; the secretary being instructed to inform the applicants that there were no free sites in Maisonneuve.

Reference has been made to Maisonneuve, a purely French-Canadian city in Quebec. It is often said that the French are not enterprising; but here is a city which in the past few years has secured some of the best industries that have come to this country. It is a city which laughs at free site seekers, yet it will spend enormous sums advertising its exceptional advantages, and we venture to say that the advantages of Maisonneuve are in no way superior to those of Sloshville. The difference is here, however:—Sloshville secures an industry by jeopardising itself for years to come, while Maisonneuve draws the best by merely telling in a widely read and trustworthy Machinery Journal, why manufacturers should locate there. A plain statement of facts will appeal more to the concern worth while, than the offer of a free site.

A 6-TON TRUCK MAKES A HEAVY HAUL.

THE 6-ton motor truck shown herewith is fitted with an interesting type of hydraulic transmission. It is known as the La France hydraulic truck. The motive power consists of a gasoline engine directly connected to a pump which has five cylinders arranged radially around a common crank shaft. This pump delivers oil to two oil motors of somewhat similar design to the pump, each motor being connected to one of the rear wheels by a chain.



Forty-six tons were recently hauled by one of these trucks up Broadway, New York to 59th street and across 59th street to 67th street and the East River. The truck, itself weighing 4½ tons, was loaded with six tons of boiler fittings; while behind was attached a wagon weighing 12½ tons and carrying a boiler weighing 23tons, which came from the Municipal Building at City Hall. At least twenty horses, it is said, would have been required to haul this load. These twenty horses would have occupied at least 250 feet on the streets of the city and would have effectively blocked all traffic while they were passing. The La France truck is only twenty feet long, so that there was over 230 feet of street space saved. Further than that the run was made with the truck in probably half the time that horses would have taken.

This run tends to prove that the hauling of heavy materials through the streets of large cities by motor trucks, either with or without trailers, is an advantage both to the user of the truck and to the general public. It is claimed that, but for the hydraulic transmission of the La France truck, it would have been impossible to start and stop with such a heavy load, without straining some of the parts of the truck. In fact it is said that one cannot overstrain this truck, because the pump is fitted with a relief valve which acts before the car gets overloaded.

The La France hydraulic truck is handled by the Hydraulic Truck Sales Co., 1777 Broadway, New York.

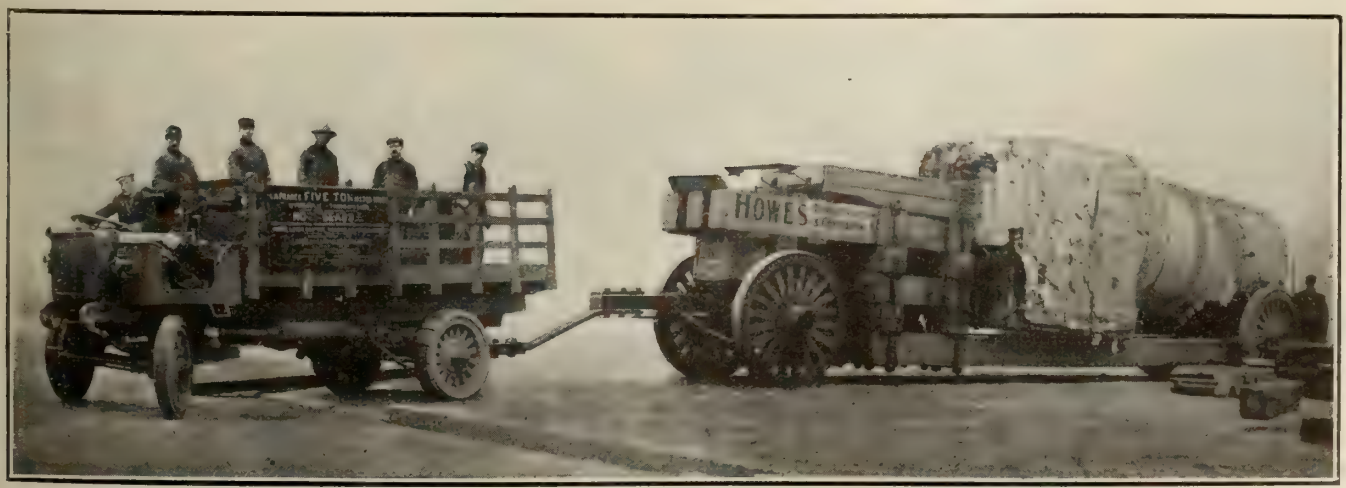
HIGH POWER PORTABLE ELECTRIC DRILLS.

THE Standard Electric Tool Co., Cincinnati, Ohio, has developed and is now placing on the market new universal portable electric drills in five sizes: ¼ in. 5-16 in., ½ in., ¾ in. and ⅞ in. These are in addition to their ⅜ in. size

HIGH POWER PORTABLE ELECTRIC DRILL.

illustrated and described in our columns in November last. These drills operate off a lamp socket on both alternating and direct current, and they will also run satisfactorily on low frequency circuits as well as on 60 cycles. Series commutating type motors of special design are used. High power and absence of any tendency to run hot are noteworthy features. An improved method of force ventilation is also used.

A prominent feature is that these motors are non-racing; that is to say, they will not race when running idle or under light load; consequently twist drills are never burned, and there is no damage, if tools are allowed to run idle indefinitely. A quick make and break switch is located in the handle, placing drills under control of operator at all times.



All armature spindles run in ball bearings. In the ½ in. and ¾ in. sizes, the gears are mounted on ball bearings encased in grease. The very highest grade bearings are used, and the most improved and best ball bearing practice is employed. All gears are supported on both ends, not studded to gear plate. The gears are generated from chrome nickel steel, case hardened and encased in grease.

These tools are intended for the hardest possible continuous service, and are said to be capable of standing the most rigorous use.

CAN. GEN. ELECTRIC IN THE WEST.

Mr. Fredric Nicholls, president of the Canadian General Electric Co., recently returned to Toronto from a visit of inspection to the company's Western Canada and Pacific coast branches. He reports business very satisfactory in the West, and states that it is intended to largely increase the size of their present office and warehouse building in Vancouver, requirements having outgrown the existing accommodation. The company has opened a branch in Victoria to take care of the business in Vancouver Island, and the plans of a five-storey office and warehouse building in Calgary have been approved, on which construction will commence as soon as the weather permits.

It has been computed that in some cases there are as many as two billion cutting points at work each minute on the face of a grinding wheel; eight hundred million per minute is not uncommon, and four hundred million per minute is quite common. When a grinding wheel is revolving at a cutting speed of about 6,000 lineal feet per minute, it will be readily seen why, in some cases, it can remove metal more quickly than the milling cutter or lathe tool.

VIEW OF THE LA FRANCE TRUCK WITH ITS OWN LOAD AND THE TRAILING LOAD.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Hamilton, Ont.—Extensive improvements are being planned for the B. Greening Wire Co.'s plant.

Fort William, Ont.—The National Tube new plant for the manufacture of pipe will be ready by the fall.

Montreal, Que.—The Canada Foundry Co. contemplate building another foundry, and are preparing plans.

Hamilton, Ont.—The Brown Boggs Co. will commence additions to their factory, costing $40,000, in the spring.

London, Ont.—A motor fire truck, costing $7,500, is required by the City Council, to be delivered May 31st, 1913.

Trail, B.C.—New machinery will be installed at the "Silver King" Mine, Trail, B.C., by the Consolidated Mining and Smelting Co.

Vancouver, B.C.—Repair shops may be built at North Burnaby by the British Columbia Electric Railway to employ 450 to 600 men.

Sarnia, Ont.—A factory, to cost $7,000, is planned for the Sarnia Bridge Co. It will be a one storey, reinforced concrete and steel structure.

Revelstoke, B.C.—The Consolidated Mining and Smelting Co. will erect a new reduction plant for zinc ores. The estimated cost is about $5,000,000.

Galt, Ont.—Canadian Motors, Ltd., are interested in the establishment of a motor works. The new company will start with a capital of $100,000.

Winnipeg, Man.—The Vulcan Iron Works, Ltd., advises that it has made an addition to its foundry, 100 x 132. Its output is now about 40 tons per day.

Guelph, Ont.—The Page-Hersey Iron, Tube and Lead Co., Ltd., are planning early extensions to their plant. These will include nipple and bedstead tubing departments.

Regina, Sask.—The Minneapolis Steel Machinery Co. have been granted a site by the City Council on condition that they build a warehouse to cost between $50,000 and $100,000.

Niagara Falls, Ont.—A site has been purchased by the Niagara Falls Furnace Co. upon which a plant of two buildings will be erected. E. T. Williams, Niagara Falls, Ont., is interested.

Welland, Ont.—Silver ore from Cobalt is reaching the Metals Chemical Co. plant, which will begin operations this week. The interior equipment has been installed.

Hamilton, Ont.—Permission is asked by the United Coke and Gas Co., Pittsburgh, to establish a by-product coke plant in conjunction with several gas companies.

Toronto, Ont.—Three and a half acres of factory land have been purchased by Mr. W. G. Harris, of the Canada Metal Co., from Mr. H. W. Petrie, of the Petrie Machinery Co.

Petrolea, Ont.—The Petrolea Valve Cap Factory, which was recently burned, will be rebuilt. New gas engines, dies, presses, general tools and pumping outfit will be required.

Welland, Ont.—Additional equipment is being put into the plant of the Billings-Spencer Co., including a chill press and drop hammers. The new boiler house is nearing completion.

Hamilton, Ont.—The Steel Co., of Canada, will erect a boiler shop, blacksmith shop and locomotive crane shelter at a cost of $25,000. The Hamilton Bridge Works Co. have been awarded the contract for the steel work.

Napanee, Ont.—The Napanee Iron Works, Ltd., successor to the Dominion Rock Drill Co., are making preparations to build a new boiler shop, which will be equipped with the latest type of machinery.

St. John, N.B.—The Noyes Machine Co., manufacturer of propellers and brass specialties, Portland, Maine, proposes to establish a Canadian plant at St. John, N.B., and has made arrangements for a building.

Hamilton, Ont.—The National Steel Car Co. have booked $3,500,000 worth of business in the past three months. They have started to deliver cars to the C. P. R. on an order received from that company amounting to $1,500,000.

Montreal, Que.—The Canadian Trust Co. on Monday, February 3, purchased from the Canadian Iron Corporation, Ltd., the McDougall Car Wheel Works on William Street for $90,000. The property has an area of 39,696 square feet.

Coldbrook, N.B.—The Maritime Motor Car Co. is constructing a plant at Coldbrook, N.B., for the manufacture of automobiles.

Hamilton, Ont.—R. S. Rider,, Secretary of The Canada Steel & Wire Co. admitted a few days ago that the U. S. steel merger had taken over the local concern.

Sarnia, Ont.—The Anker-Holth Co., manufacturers of cream separators, will begin operations at their Canadian plant in a few days, and will employ thirty-five machinists. Lieut. Andre Ruel, the French aviator, will manage the concern.

Brockville, Ont.—Notices were sent out last week, calling the annual meeting of the Canada Foundries and Forgings Co. for Tuesday, February 11, at the head office here. It is understood that the earnings have been very satisfactory.

St. Thomas, Ont.—Negotiations have been completed for the location of a structural steel plant on the Mann farm. The company will be given a loan of $50,000 for 15 years by the city, and will employ 160 hands, and erect a $100,000 plant, covering 12 acres.

Sault Ste. Marie, Ont.—Extensions, costing $12,000,000, will be made at the plant of the Lake Superior Corporation, including blast furnaces, new rail mill, billet mill another open heart furnace, another battery of coke ovens, dock extensions, transporters, blooming mills and another merchant mill.

Welland, Ont.—The forge department of the Canada Forge Company was completely destroyed by fire on Sunday morning, February 2. The company will erect a larger building to take its place, and in the meantime have put up a temporary structure. The loss of $35,000 is covered by insurance.

Amherst, N.S.—The Canadian Car and Foundry Co. are making extensive additions to their car building plant, which will require additional horsepower of 500. The freight car erecting shop is now working on 15-ton hoppers for the Dominion Coal Co., on Canadian Northern box cars, and on Intercolonial ballast cars.

Electrical

Toronto, Ont.—The city council may spend $90,000 on generators to supply $6,000 kilowatts.

Outremont, Que.—It was announced at a recent council meeting that this town will generate its own electricity in the future.

Medicine Hat, Alta.—The government will install an up-to-date telephone service in this city. Building will commence in the spring.

Port Arthur, Ont.—Two new street cars with trailers are required. The city will take 250 h.p. more from the Kaministiquia Power Co.

Sarnia, Ont.—The city's Hydro-Electric line will be extended to Sebringville, to supply that village with power. Power will be generated at the local plant.

Calgary, Alta.—The city council is considering the question of adopting trackless trolley cars or motor buses in the residential districts where tracks are objectionable.

Welland, Ont.—The Ontario Power Co. will sell no more power in Welland than is already contracted for. A hydro-electric line may be built to this city from the Falls or Allanburg.

Calgary, Alta.—Mr. R. A. Ross, who was engaged to advise the council on the best method of obtaining power, has recommended a ten-year agreement with the Calgary power company.

Macleod, Alta.—The Canadian Western Natural Gas Light Heat and Power Co. will supply this town with a minimum of 750,000 feet of gas for its power house, at the same rate as it supplies Calgary.

Toronto, Ont.—The civic car lines on St. Clair Ave. will be set in operation as soon as possible. Works Commissioner Harris will purchase requisite land for car barns, buildings, and will secure the rolling stock necessary.

Montreal, Que.—The Cedar Rapids Power Co. have sold to the Aluminum Co. of America, and the Montreal Light, Heat and Power Co., 80,000 horse-power, leaving 40,000 horse-power to be sold out of the first installation of 120,000 horse-power.

Montreal, Que.—The National Hydro-Electric Co. is making application to the city council for permission to enter the city to sell electric power. It will develop 160,000 horse-power at Carillon Falls, thirty-five miles from Montreal.

Grande Mere, Que.—The H. E. Talbott Co., of the Soo have been awarded the construction of a 1,500-foot dam and the installation of a complete hydro-electric system. The contract involves over $1,500,000, and will employ a thousand men. Over 75,000 h.p. will be developed at the new station.

General Industrial

St. Catharines, Ont.—Upton's, Limited, will erect a new plant here to cost $45,000.

St. John, N.B.—Work on the foundations of the Atlantic Sugar Refineries, Ltd., has been begun.

Chatham, Ont.—A $65,000 factory will be erected here this summer by the Dominion Canners, Ltd.

Berlin, Ont.—The W. E. Woelfle Shoe Company will soon be ready for business in its new building.

Regina, Sask.—The Regina Heating and Sheet Metal Co. have applied to the City Council for a site.

Huntsville, Ont. — The Portland Cement Co. will build a plant at Marlboro, 17 miles west of Edson.

Blenheim, Ont.—The Blenheim Canning Co. will begin the erection of a new $40,000 factory as soon as possible.

Ottawa, Ont.—The mica factory of Messrs. Blackburn Bros. was completely destroyed by fire recently, the loss being $10,000.

The Dominion Waste Co. have moved into their new factory on Paton Road, Toronto. Sythes & Co. are their sole selling agents.

St. John, N.B.—The American Steam Laundry, recently burned at a loss of $16,000, will be rebuilt. New machinery will be required.

Burlington, Ont.—The Cedar Valley Brick Co. will install a complete and modern brick-making plant at an estimated cost of $44,000.

North Bay, Ont.—A new factory will be built at Widdifield Station by the Energite Explosive Co., whose plant was wrecked recently.

Sarnia, Ont.—The Imperial Oil Co. will extend its operations in Canada, and has increased its capital stock from $6,000,000 to $15,000,000.

Montreal, Que. — The Consolidated Milk Co. will equip a modern cold storage and creamery plant on St. Viateur Street, at a cost of $250,000.

Arcola, Sask.—The Aerated Water Works Co. has been burned out. The business of the firm is now being conducted from temporary quarters.

West Toronto, Ont.—The Mason & Risch Piano Co., have had plans prepared for a new factory of cut stone, mill construction. It will cost $10,000.

Harriston, Ont.—The Harriston Furniture Co. is having plans prepared for an extension to its factory on Webb Street. Factory machinery and a freight elevator will be required.

Sydney, N.S.—The Sydney Boot and Shoe Co., Ltd., has been organized with a capital stock of $100,000, and will erect a factory to cost $50,000. Electric dynamos and machinery will be required.

Medicine Hat, Alta.—The Maple Leaf Milling Co. contemplate erecting an additional flour mill in the West. The present mill is in this city. Formerly it was at Moose Jaw, but was moved when the plant was burned.

Hamilton, Ont.—The Eversharp Pencil Co., St. Paul, Minn., is looking for a site upon which to erect a Canadian factory. H. C. Carson is representative. H L. Frost, of the Frost Wire Fence Co., Sherman Avenue, North Hamilton, is interested.

Welland, Ont.—Industrial Commissioner McCormick announces that a new company, with a capitalization of $500,000, will erect a plant for the manufacture of cotton fabric. The contract for the building will be let within thirty days. A site of 20 acres has been acquired. The factory will measure 100 x 250 feet, and will employ 250 hands.

Calgary, Alta.—A million and a half dollars will be spent on a new plant for the manufacture of pottery by the Calgary Clay, Coal and Coke Co., Ltd., recently incorporated. A. F. McLaren, of Toronto, is at the head of the new organization, and with him are associated T. B. Miller, president of the Laurentia Milk Co.; Senator Baird, of New Brunswick, and a number of other Eastern and Western capitalists. The company has an authorized capital of $2,800,000.

Municipal

Calgary, Alta.—A movement is on foot to quash the $1,000,000 by-law providing cost of proposed bridge over the Bow River.

Sarnia, Ont.—Tenders are being called by the town for the construction of a quarter million dollar waterworks at Point Edward next summer.

Toronto, Ont.—Application is being made for power to build an 18-ft. subway on Yonge Street and to widen that street at a cost of $1,300,000.

Collingwood, Ont.—The County Council has set apart $36,000 for roads and bridges, $8,000 of the sum to be applied on bridges and $28,000 on roads.

Taber, Alta.—The burgesses are about to vote on a by-law to raise $25,000, to be granted as a bonus to the Dominion Stove and Foundry Co., Ltd., who will commence operations here.

Calgary, Alta. — Special legislation will be asked of the Provincial Government to raise $30,000 by debentures for the purpose of buying motor trucks and equipment for corporation work.

Burks Falls, Ont.—On April 18th a by-law to provide and authorize the issue of debentures for $88,000 re waterworks extension will be declared passed on the above date unless a protest is made.

Toronto, Ont.—Several Ontario municipalities have asked the Federal Government to assist them to build a municipal radial railway from Toronto to Port Perry. They ask for a bonus of $6,500 per mile for 68 miles.

Regina, Sask.—On February 25th the following by-laws, among others, will be placed before the burgesses to raise $825,000 for street railway; $425,000 for new electric light plant; electric light and fire equipment, $310,000; $117,000 re incinerator and garbage equipment; $622,000 re waterworks extension; $25,000 for gas mains.

Edmonton, Alta.—On February 24th the following by-laws, among others, will be submitted to the burgesses for ratification:—To raise $168,386.67 to acquire Government telephone system within city limits; $484,720, cost of power house and plant; $453,086.67, cost of electric lighting system; $1,543,320 for street railway; $453,154, cost of bridge improvement.

Railways—Bridges

Guelph, Ont.—The Wellington County Council will spend $50,000 on bridges in connection with a good roads scheme.

Fredericton, N.B.—Tenders are being asked for the construction of a bridge across the Miramichi River to cost $300,000.

Hamilton, Ont.—Station and railway extension, to cost $3,000,000 is planned for the Toronto, Hamilton and Buffalo Railway.

Toronto, Ont.—It is said that Messrs. Mackenzie and Mann are at the head of a huge radial railway scheme in Ontario.

Winnipeg, Man.—A company will build an electric railway between Portage la Prairie and this city.

Toronto, Ont.—Owing to congestion and traffic dangers, the city may have the Dundas St. bridge rebuilt.

Montreal, Que.—The Montreal Tramways Co. have ordered 50 car bodies from the Canadian Car and Foundry Co.

St. Catharines, Ont.—A viaduct across the old Welland Canal, with two vehicular driveways will be required now that the C.N.R. is entering this city.

Welland, Ont.—At a meeting of the directors of the Niagara, Welland and Lake Erie Railway Company last week, it was decided to proceed with extensions at once.

Toronto, Ont.—A plan has been submitted to the City Council by the G.T.R. for a new 26 stall locomotive house with machine shop attached near the foot of John Street.

Quebec, Que.—The Quebec Harbor Commission has ordered three six-wheeled switching locomotives from the Montreal Locomotive Works, for delivery in April.

Saskatoon, Sask.—Work will commence in the spring on the largest reinforced concrete bridge in Canada. The Government will pay two-thirds of the cost.

Brockville, Ont.—The town council and Board of Trade have appealed to the Minister of Railways and Ontario Legislature against the proposed removal of the G.T.R. shops to Prescott.

Toronto, Ont.—The Canadian Northern Ry., between Dec. 15, 1912, and Jan. 15, ordered 250 box cars from the National Steel Car Co., and 100 refrigerator cars from the Mount Vernon Car Mfg. Co.

Victoria, B.C.—Tenders will be called for shortly by the Canadian Northern Pacific Railway Co. for the construction of their line to Union Bay. A new wharf will be built at the latter place. The rails are en route from Sydney, N.S.

Cobalt, Ont.—The Associated Boards of Trade of Temiskaming have petitioned the Federal Minister of Railways and Canals, asking aid of the government in the construction of a bridge over the Quinze River at North Temiskaming, in the northern part of Quebec. The cost of the structure will amount to about $60,000.

Kingston, Ont.—E. J. Chamberlin, President of the Grand Trunk Railway, has informed the City Council that it would cost about $1,000,000 to divert the main line through Kingston, and the company cannot, owing to the financial situation, consider it.

New Westminster, B.C.—The Western Canada Power Co., Vancouver, will build a line 17 miles long between Stave Lake and Pitt River for hauling logs to the river. It will later form a part of the electric line planned between Vancouver and Mission City.

Sydney, N.S.—Fifty new steel hoppers of 100,000 pounds capacity are to be added to the rolling stock of the Sydney & Louisburg Rly. this spring. The cars are being built by the Montreal Car Works. Two small locomotives for use around the banking stations are to be secured.

Kingston, Ont.—Application will probably be made at the next session of Parliament for the incorporation of the Ottawa, Rideau Lakes & Kingston Ry. Co. This company proposes an electric railway between the points named, and is reported to have secured about $250,000 toward the construction of its line. J. S. R. McCann, Kingston, Ont., is a director.

Toronto, Ont.—The Toronto Suburban Street Ry. Co. has laid out a trial line for its entrance into Guelph.

Cochrane, Ont.—The Canadian Central & Labrador Ry. is to apply to Parliament for powers to build a railway from Cochrane in a northeasterly direction to a point near Cape St. Lewis on the Atlantic coast, with a branch line to a point near the mouth of the Hamilton River, Quebec, and also a branch line to the city of Quebec.

Calgary, Alta.—The Western Canada Ry. Co. is to apply at the present session of Parliament for an act of incorporation. The company propose to construct a line to be operated by steam and electricity from Fort Churchill, on Hudson Bay, through Manitoba, south of the Churchill River and north of the Nelson River, to a point at or near Sea Falls, on Nelson River, thence north of Lake Winnipeg, through Saskatchewan to Prince Albert; thence continuing through Saskatchewan and Alberta, in a direct line to Calgary, with power to construct a branch line from a point near Manitoba Lake in Saskatchewan to Edmonton. The company proposes to ply between Fort Churchill and other countries; to construct, operate and maintain docks, wharves and elevators, and operate telegraph and telephone lines along the whole length of the proposed railway.

Wood-Working

Fort William, Ont.—The C.P.R. Carpenter Shop and contents were burned on Monday, Jan. 13. Damage $1,000.

Winnipeg, Man.—The Acme Sash and Door Factory on Rue De Meuron in Norwood is completed and in operation.

North Bay, Ont.—The Expanse Lumber Co. are considering the purchase of sawmill machinery for use at Haileybury, Ont.

Grimsby, Ont.—A factory for making baskets will be erected at Grimsby, Ont., by Arthur Hewson, care Grimsby Manufacturing Co.

Newcastle, N.B.—Falconer's carriage fatory and Falconer & Allen's stock were destroyed by fire February 1. Some insurance was carried.

Calgary, Alta. — The woodworking plant of J. M. Bateson was burned down on Monday, Jan. 20. The loss, $60,000, is covered by insurance.

Fredericton, N. B.—Aiken Brothers' lumber camp on the Keswick was destroyed by fire on Monday, Jan. 6, the loss being upwards of $1,000.

St. Charles, Que.—N. Labrie's sawmill was recently destroyed by fire at a loss of about $12,000, partly covered by insurance. Mr. Labrie will rebuild.

St. Mary's, Ont.—Daniel Baird, Station West, plans to erect an addition to his planing mill, for which new woodworking machinery will be required.

London, Ont.—Mr. R. C. Eckert, 434 Queen's Avenue, London, Ont., is interested in a syndicate which has purchased a site for a furniture factory here.

Quebec, Que.—Old buildings are being razed on the Louise Docks to make way for the new Harbor Commissioner buildings. The builders will be ready for steel in a month.

Grand Falls, N.B.—The Engineers of the Grand Falls Co. completed plans for immense pulp and paper mills at Grand Falls. These will be submitted to the directors at an early date.

Belladune, N.B.—The mill of the Saw Mills Owners Sales Co. has been burned out. It was a new winter mill, which had just been completed, and was fully equipped, including electric light.

Fredericton, N.B.—Messrs. D. Fraser & Sons have taken possession of the Scott Lumber Co.'s property, which they acquired in their recent $150,000 timber lands purchase, and work has been started upon the improvements to be made at the Victoria Mills.

Toronto, Ont.—Fred W. Halls Paper Co., Ltd., has been incorporated in Ontario, with head office at Toronto, and capital stock of $40,000, to carry on the business of manufacturing paper, etc.

Shawinigan Falls, Que.—The Belgo-Canadian Pulp Co. are adding to their electrical equipment, having purchased eleven Canadian General Electric motors, aggregating two hundred horsepower.

New Westminster, B.C.—A sawmill, box factory and shingle mill, costing $75,000, will be erected here by Temple, Ronald Cliff and J. H. McDonald, late manager of the British Canadian Lumber Co.'s mills on Lulu Island.

Vancouver, B.C.—The British Over Seas Trust Company, Limited, recently incorporated in British Columbia, includes among its various powers granted by charter the right to secure and develop timber limits, pulp or paper making works, sawmills, etc. The capital of the company is $250,000.

St. John, N.B.—The city has sold to Mr. Frank H. Davis certain parts of the city's pulp mill at Mispec. The sale included two pumps, two lathes, one vertical drill, one planer, one shaper and one small engine, in addition to a number of other smaller articles. The price was $15,250.

Sudbury, Ont.—J. B. Laberge & Sons will build a large planing mill and sash and door factory in the spring. The factory will be equipped with latest machinery, and will employ 40 hands to start. Mr. F. H. Aurie will be the factory manager.

Stratford, Ont.—Messrs. Chas. Farquharson and F. Gifford, of the Geo. McLagan Furniture Co., will on certain conditions build a $30,000 factory for the manufacture of Davenport beds, upholstered furniture. It will be four storeys in height.

New Westminster, B.C. — The Royal City Mills plant of the B.C. Timber & Trading Co., has been purchased by Capt. C. H. DeBeck, former president of the Fernridge Lumber Co. He will operate there a shingle and cedar saw mill plant. Its capacity will be 150,000 shingles and about 15,000 feet of clear cedar a day.

Building Notes

Toronto, Ont.—The Zionist Societies will erect an institute at a cost of $50,000.

Stratford, Ont.—A factory, costing $15,000, will be built for the Stratford Mill Building Co.

Montreal, Que.—The factory of the Bass Fur Co. was recently burned, the loss being $50,000. It will be rebuilt at once.

Toronto, Ont.—A factory, to cost $100,000, for A. B. Ormsby & Co., is being erected by Wickett Bros. It is one of two storeys, 247 x 260, cement and brick foundation, brick and structural steel construction.

Toronto, Ont.—Mr. James Ryrie will erect a five-storey office and commercial building, costing $250,000, at the corner of Yonge and Shuter Streets.

Moose Jaw, Sask.—The Metal Specialties, Ltd., will construct buildings, costing $75,000, exclusive of machinery.

Edmonton.—It is reported that the Cockshutt Plow Co. is contemplating the erection of a new warehouse, to assist distribution in the West.

Vancouver, B.C.—The Dominion Construction Co. have secured the contract for the erection of a ten-storey office building for the Yorkshire Guarantee and Securities Corporation. The approximate cost is placed at $250,000.

Vancouver, B.C.—The tender of Mr. C. F. Perry for the construction of new police headquarters has been accepted. His price is $250,000.

Lethbridge, Alta.—The International Harvester Co., of America, will build a four-storey warehouse, costing over $100,000. It will be large enough to accommodate 100 carloads of machinery.

Regina, Sask.—Plans are being prepared for the erection of Winter Fair buildings at a cost of $134,000, 328 feet long by 190 feet wide. They will be heated throughout by steam.

Refrigeration

Westmount, Que.—The Ice Manufacturing Co., have been granted permission to build a plant on Bethune Street.

Toronto, Ont.—Tenders have been called for the 100-ton ice plant by the ice dealers of this city, the estimated cost of which, including the building, will be $100,000.

Montreal, Que.—There is a renewed talk of a new skating and hockey arena with artificial ice. There is a scarcity of playing ice at present, and on this account some of the rinks charge exorbitant terms to some of the smaller hockey clubs.

Toronto, Ont.—The Ice Manufacturing Co., Ltd., have purchased a site in the north east section of the city, along the C.P.R. main line to Montreal, and will

build an ice factory of 200 tons daily capacity, and ice storage of 50,000 tons capacity. A smaller plant will be built in the east end of the city.

Toronto, Ont.—Construction will begin soon on the Toronto Municipal Abattoir, where facilities will be provided for private butchers, or meat dealers to do their slaughtering. There will be three buildings; the abattoir proper, a rendering plant, and a power house. Refrigerating machinery will be installed.

Marine

Ottawa, Ont.—The Government will spend large sums of money on harbor improvements at St. John, N.B.; Quebec, Trenton, Ont.; Toronto, Brighton, Ont.; Oshawa, and Port Credit.

Ottawa, Ont.—The Government will spend $500,000 for waterway improvements at French River, and $2,000,000 for the Welland Canal. The sum of $250,000 is asked for a new ice-breaker steamer for the St. Lawrence, and $145,000 for a fisheries patrol steamer for Lake Winnipeg.

Sault Ste. Marie, Ont.—The promoters of a dry dock have succeeded in financing the enterprise in England. Messrs. Pethwick Bros., Ltd., of Plymouth and London, have undertaken the work at a cost of $1,000,000. Construction will commence April 30, 1913, and the dry dock must be completed by October 1, 1914.

Montreal, Que.—The Montreal Harbor Commission has awarded a contract for a 1,500,000 bushel addition to its elevator No. 1, to John S. Metcalf Co., Montreal. This will make the total capacity of this elevator 2,500,000 bushels; while elevator No. 2, recently completed by the same firm, has capacity for 2,600,000 bushels. The addition will be of reinforced concrete and steel, and will cost approximately $700,000.

Tenders

Winnipeg, Man.—Tenders for the erection of a grey iron foundry building at this place were received until noon of February 8, 1913, at the offices of the Manitoba Bridge and Iron Works.

Woodstock, Ont.—Tenders will soon be called for the New Agricultural College so that work will be completed this season. The cost without equipment is estimated at $30,000. Among the departments requiring machinery will be the forge, concrete laboratory, power house, and manual training department.

Sarnia, Ont.—Tenders will be received up to March 15 for waterworks construction. These include:—Furnishing cast-iron or steel water pipes and special castings; gate valves, flexible joints, expansion joints, etc.; furnishing and erecting pumping machinery and accessories; furnishing and erecting boilers.

Vancouver, B.C.—Tenders are invited for: 5,280 lin. ft. of 2-in. gal. iron pipe with unions; 5,280 lin. ft. of 4-in. No. 8 lapwelded or weldless steel pipe; 107,000 lin. ft. of 6-in No. 9 lapwelded or weldless steel pipe; 50,000 lin. ft. of 8-in. No. 7 lapwelded or weldless steel pipe. These should reach City Purchasing Agent, City Hall, before March 5.

Dalhousie, N.B.—Sealed tenders will be received by the Town Clerk until 8 p.m., Wednesday, March 5, 1913, for the following works:—

Contract B—Power house.

Contract G—Booster pump: (1) steam pump, (2) turbine pump.

Contract H—Two boilers.

Contract J—Electric light engines: (1) High speed steam engine, (2) Gas engine and gas producers, (3) Diesel oil engine, (4) Crude oil engine.

Contract K—Electrical equipment and distribution system.

Plans and specifications may be seen on and after February 10th at the office of the Chief Engineers, Mail Building, Toronto, or at Dalhousie, N.B. W. S. Montgomery, Mayor; Alex. J. Le Blanc, Town Clerk; Chipman & Power, Engineers.

Toronto, Ont.—Tenders will be received by registered post only, addressed to the Chairman of the Board of Control, City Hall, Toronto, up to noon on Tuesday, March 4th, 1913, for:

Concrete Mixers,
Grading Machines,
Tar Kettles,
Road Rollers, 3-wheel,
Road Roller, tandem,
Scarifiers,
Stone Crushing Outfit, complete (stationary.)
Centrifugal Pumps, portable, with boilers, mounted.
Boilers Mounted,
Hoisting Engines and Boilers,
Derricks,
Clams,
Buckets,
Excavating Machine, complete,
Diaphragm Pumps and Hose,
Inspection Rods.

Specification and tender form may be obtained upon application at the office of the Purchasing Section, Department of Works, City Hall, Toronto.

New Incorporations

Moose Jaw, Sask.—Moose Jaw Engineering Works, $300,000.

St. John, N.B.—Canadian Motor Co., $15,000—I. S. Houghton, W. W. Gerow, B. L. Gerow.

Granby, Que.—Macdonald Car Buffer Co., $500,000. M. Alexander, P. C. Dwyer, D. B. Smith, Montreal.

Preston, Ont.—Cast Aluminum Ware Co., $40,000—H. R. Schmiedendorf, Buffalo; A. Ochs, W. Stalhschmidt, Preston.

Westport, Ont.—Westport Woodworking Co., $40,000—W. C. Whitcher, Westport; W. R. McGree, G. M. Dudley, Ottawa.

Sarnia, Ont.—Anker-Holth Separator Co., $40,000—S. C. Anker-Holth, G. T. Benson, Port Huron; H. F. Holland, Sarnia.

Hamilton, Ont.—White Sewing Machine Company of Canada, $40,000 — C. Touby, Cleveland; C. Stewart, W. C. MacBrayne, Hamilton.

Vancouver, B.C.—Pacific Coast Cable Co., $25,000. Dickie Creek (Lillooet) Power and Light Co., $25,000. Booth Logging Co., $100,000.

Palmer Rapids, Ont.—Hamilton Corundum Co., $200,000. W. J. Hamilton, Flint; G. Hamilton, Mendon, Mich.; G. E. Foote, Kalamazoo, Mich.

Vancouver, B.C.—A company, headed by E. H. Heaps, is planning a new steamship service from Montreal to Vancouver, by way of Panama.

Kingston, Ont.—A new firm of engineers and contractors under the name of The Kingston Construction Co., has been formed, with George Wright, C.E., as general manager. They will make cement brick, concrete block,and artificial stone specials.

Winnipeg, Man.—The Lake Winnipeg Brick and Lumber Co. has been incorporated under the Manitoba Companies Act, with powers for the development of lands in the province, operating vessels, carrying on the business of a common carrier, the ownership of docks, wharves and terminal facilities.

Toronto, Ont. — Incorporations mentioned in The Ontario Gazette last week were:—National Gas Co., Ltd., Toronto, capital $500,000; Queen City Pressed Brick Co., Ltd., Toronto, capital $200,000; The Renfrew White Granite Co., Ltd., Ottawa, capital $180,000; Ontario Stone Corporation, Ltd., Toronto, capital $175,000; Trout Creek Gold Mines, Ltd., St. Catharines, capital $150,000; Can-

adian Woodtile Co., Ltd., capital $150,000.

Corbeil, Ltd., incorporated at Ottawa with $1,000,000 capital, to carry on business as boot and shoe manufacturers at Montreal: Incorporators, Avila Corbeil, Emile Corbeil, Leonard Blais, Theophile Desrochers, and H. J. H. Morrier, all of Montreal.

Chambers, McQuigge & McCaffrey, Co., Ltd., incorporated at Ottawa as contractors, Toronto, with $500,000 capital: Incorporators William Clark Chambers, Anson Spotton, Henry Leighton, Eunice Leighton, Irene Edmunds, all of the town of Harriston.

The Perkins Electric Co., Ltd., have been incorporated at Ottawa, capital $50,000; to manufacture electrical machinery and supplies at Montreal: Incorporators, Frederick J. Parsons, Philip S. Fergusson, Walter R. Baillie, Geo. F. Perkins, Montreal, and Calvin Colborne Perkins, Mansonville, Que.

Sorel Iron Works, Ltd., incorporated at Ottawa with $100,000 capital, to conduct an iron and steel foundry and machine and repair shop at Sorel, Que.: Incorporators Antonin Patrice Pontbriand, George W. Pontbriand, Henri M. Pontbriand, and J. I. Pontbriand, Come Damien Pontbriand, all of Sorel.

Amherst Pianos, Ltd., have been incorporated at Ottawa with a capital of $500,000 to manufacture pianos and other instruments at Amherst, N.S.: Incorporators, Robert Harper Murray, John Lauchlin MacKinnon, Emily Hilton, Grace C. Griffin, and Wm. Martin McDonald, all of Halifax.

Missisquoi Marbles, Limited, incorporated at Ottawa, with $1,000,000 capital, to work quarries, with offices at Philipsburg, Que.: Incorporators, Andrew Ross McMaster, of Westmount, Talbot Mercer Papineau, John Keery, Margaret Hartley, Montreal, and Gertrude H. Flawn, of Outremont.

Canadian Griscom-Russell Co., Ltd., incorporated at Ottawa, with $50,000 capital, to carry on business as iron and brass founders and machinery manufacturers at Montreal: Incorporators, John Wilson Cook, K.C., Allan Angus Magee, Thomas J. Coonan, Thos. B. Gould, and Pearl Catherine Mahoney, all of Montreal.

Montreal, Que.—W. F. Myers Diamond Saw. Tooth & Tool Co., $5,000; J. A. Mann, C. G. Mackinnon, T. B. Gould. Modern Joint of Montreal (founders), $5,000. J. Galipeau, S. Langlais, T. Gou... Perkins Electric Co., $50,000. F. J. Parsons, P. S. Fergusson, W. R. Baillie. Canadian Griscom-Russell Co., $50,000 (iron founders), J. W. Cook, A. A. Magee, T. J. Coonan. American Engineering and Machinery Co., $50,000. L. J. Loranger, J. A. Prudhomme, M. Loranger.

Macdonald Car Buffer, Ltd., incorporated at Ottawa with $500,000 capital, to manufacture cars and car buffers and railway equipment of every kind: Incorporators Maurice Alexander, Patrick Clarke Dwyer, Darley Burley Smith, Jean Gustave Mignault, all of Montreal, and Jennie Louise Lawrence, of Westmount.

Lake Erie & Quebec Transportation Co., Ltd., incorporated at Ottawa with $400,000 capital, to sell and make machinery required in the construction of ships, at Montreal: Incorporators Francis George Bush, George Robert Drenman, Michael Joseph O'Brien, Herbert William Jackson, Gordon Francis MacNaughton, all of Montreal.

The Owen Sound Rolling Mills Co., Ltd., incorporated at Ottawa with $500,000 capital to manufacture wrought iron and steel, nuts, bolts, pig iron, billets, etc., at Owen Sound, Ont.: Incorporators, Archibald Henry Macdonald, John Jacob Drew, Frederic Watt, Priscilla Jean Ryde, and Alice Beatrice Cabeldu, all of Guelph, Ont.

Toronto, Ont. — Goldsmith Brothers Smelting and Refining Co., $40,000—H. L. Nussbaum, Chicago; J. G. Maycock, Cincinnati; E. F. Singer, Toronto. Bell-Field Manufacturing Co., $40,000—J. H. Hunter, W. M. Cox, R. G. Roberts. Glenwood Natural Gas Co., $750,000—H. Riley, W. B. Sturrup, J. F. MacGregor. Standard Bronze Co., $40,000—C. S. McDonald, C. H. Wilson. Jarvis Oil and Gas Co., $40,000—J. Gray, A. Gray, G. A. Jones. Clements Manufacturing Co., $20,000—D. I. Grant, G. A. Urquhart, E. Eisinger. McLaren Lumber Co., $1,250,000—R. C. LeVesconte, V. J. Callen, H. Dreamy. Dominion Traction and Lighting Co., $12,500,000. W. A. J. Case, J. B. Taylor, C. G. Lynch.

Miscellaneous

Toronto, Ont.—The Simpson Avenue Methodist Church will build a two-storey school house, costing $30,000.

Saskatoon, Sask.—The Winter Fair Board have asked the City Council for $150,000 to build a Winter Fair building.

Lethbridge, Alta.—The Calgary-Coutts branch of the G. T. R. through this town will not be built in 1913, but the Regina-Lethbridge branch will be.

Stratford, Ont.—The B. F. Kastner Co. agree to erect a $15,000 plant for the manufacture of leather mitts and gloves if the town will make certain concessions.

Toronto, Ont.—The Delaney & Pettit Co., Ltd., will erect a two-storey brick factory at 105 Jefferson Avenue, costing $10,000.

Penetanguishene, Ont.—A by-law giving the town the right to loan $25,000 to the Dominion Stove and Foundry Co., to enable it to extend its plant, has been passed.

Montreal, Que.—William Daly has been given the contract to complete the unfinished section of the Transcontinental between Levis and the New Brunswick line.

Chatham, Ont.—The ratepayers last week carried the Chatham Auto Wheel Co. industrial by-law, and now the company will build a factory costing 40,000 and employing 40 men.

Port Arthur, Ont.—The City Council is considering a proposal from a Northern Island pulp wood company for the establishment of a pulp and paper mill at a cost of $750,000.

Chatham, Ont.—The Miramicho Foundry have started work on a passenger steamer for Cape Breton parties. It will be 60 feet long and 14 feet beam. It will be finished in May.

Toronto, Ont.—The warehouse of the Railway Equipment Company and the factory of the Bowman Range Company were burned out in a fire on Dundas Street, Monday night, February 10.

Saskatoon, Sask.—Sealed tenders, addressed to the City Commissioners, will be received up to twelve o'clock noon on Thursday, the 27th day of February, 1913, for one 1,000 lbs. electric service truck.

Fort William, Ont.—The capacity of the Seaman-Kent plant will be doubled this spring, additional buildings and equipment being required. Four additional kilns will be installed. Mr. J. E. Ockley is the loal manager.

Toronto, Ont.—Mr. W. R. Brock has bought the factory and land of the E. W. Gillett Co. at King and Duncan Streets, and it is reported he sold it to the Faney Goods Co., of Canada. The building is worth 35,000.

Toronto, Ont.—Seventy-five new cars are to be turned out by the Toronto Railway Company this year. They will be of the most improved type. The style of the new cars will be of the same class as their latest make, with a few added modern conveniences.

Fraser Mills, B.C.—The Canadian Western Lumber Company are erecting a large cedar plant at a cost of $350,000 to $400,000 for the manufacture of sashes and doors. The new mill will have a capacity of 125,000 feet per day, and will employ 200 hands.

Berlin, Ont.—William Greene & Rome Co., Ltd., shirt and collar manufacturers, are erecting a factory building of four storeys. It is to be modern in every particular, 200 x 150, with separate power plant. It will be constructed of reinforced concrete, flat slab system, with round concrete columns, and equipped with five towers and sprinkler systems. Wm. Steele & Sons, Toronto, are the engineers and architects.

Vancouver, B.C.—Work will soon commence on the C.N.R. works at Port Mann, B.C. The buildings to be erected are as follows: Fifteen stalls of what will later be enlarged to a 42-stall roundhouse; a repair shop; coaling station; oil storage house and a general store house for train equipment. With the repair shop will be a complete foundry, and blacksmith shop.

Windsor, Ont.—The Remington Arms Union Metallic Cartridge Company, of New York, are shortly to establish a big plant, which will enable the company to enter the Canadian field on a very extensive scale. The site of 100 acres purchased includes property on the south side of Tecumseh Road, extending along Howard Avenue from the tracks of the Canadian Pacific Railway. The company have awarded contracts for its first buildings to Windsor contractors. Construction work will be started at once, and it is expected that one building in which at least fifty men will be given employment will be ready in April. It has been decided to confine the operations to the manufacture of cartridges for the present, and a plant requiring several hundred employees will be completed in the near future. No powder will be manufactured in Windsor.

Obituary

R. H. Wolfe—Word has just been received of the death in Germany of R. H. Wolfe, former president of the Electro-Metals Co., of Welland. Mr. Wolfe has not been actively connected with the firm recently, and had been spending his time in his native land, where the body will be interred.

Mr. Robt. Woon, of the R. Woon & Co. machine works, Oshawa, Ont., died on Friday, January 24, after a very brief illness. He was born in Oshawa. The deceased started with the Joseph Hall Manufacturing Co. in 1864, and when that concern failed he, with Mr. French, started the present works known as the R. Woon & Co. works, purchasing the patterns of the defunct firm.

Mr. Christian Kloepfer, ex-M.P., of Guelph, Ont., died on Sunday, February 9, from pneumonia. At the time of his death he was president of the C. Kloepfer Co., Ltd., wholesale carriage hardware, of Guelph and Toronto; of the Raymond Manufacturing Co., of Guelph; of the Dominion Linen Manufacturing Co., Ltd., of Guelph; of the Guelph Worsted Spinning Mills Co., Ltd., and of the Trusts and Capital Brewing Co., of Ottawa; vice-president of the Guelph Stove Co., Ltd., and of the Trusts and Guarantee Co., Toronto; director of the Spanish River Pulp and Paper Co., Ltd.; of the Dominion Permanent Loan Co.; of the Traders Bank before its amalgamation with the Royal Bank, and of the Commercial Travelers' Association.

Mr. Wm. Johnston Sproule, M.E. (McGill), died at his home at St. Lambert, Que., on Thursday, Feb. 6. He was connected with the Montreal Harbor Commissioners as assistant engineer for 30 years, but retired two years ago. He was born at Schomberg, Ont., and after receiving his elementary education at that place came to this city to take a science course in McGill. Shortly after graduating, he joined the Montreal Harbor Board staff. He was the first mayor of St. Lambert, and at the time of his death was a councillor of the town. Mr. Sproule was a member of the council of the Canadian Society of Civil Engineers.

Personal

T. F. Kelly, contract agent of the Cataract Power Company, has accepted a position at Dayton, Ohio.

Mr. Fox, resident of Minneapolis, but formerly of London, Eng., was made water works engineer of Calgary on January 27.

Mr. F. Ross Newman, resident manager in Toronto for the Canadian Fairbank Morse Co., Ltd., has gone to Europe for a well earned rest.

Mr. G. W. Smith, president of the Engineering Equipment and Supply Co., Montreal, entertained his staff at dinner on Thursday night, Feb. 6.

Mr. John E. Gow, of Kingston, district inspector of Inland Revenue, has been appointed inspector of bonded manufactories for the Dominion.

H. H. Wilson has been appointed Toronto Assistant-Inspector of Gas and Electricity, and **E. Little** to a similar position at Fort William, by orders in Council.

Mr. P. H. Kemble is severing his connection with the Toronto Electric Light Co. Mr. Kemble has accepted the position of manager of the commercial department of the Union Gas and Electric Co., Cincinnati.

W. M. B. MacDonald, electrical superintendent of the Cape Breton Electric Co., was married in Montreal recently to Miss Hebden, the daughter of a Montreal banker. Mr. and Mrs. MacDonald will make their home in Sydney.

Mr. Allan A. McQueen, B.A.Sc., an honor graduate of the School of Practical Science, Toronto University, 1912, has just received the appointment of assistant power engineer of the city light and power system of Winnipeg. Mr McQueen was at one time connected with the Toronto Hydro-Electric system.

E. J. Phillips, of Berlin, has been appointed manager of the Brockville light and water department, to succeed C. T Wilkinson, who has retired to go into business. Mr. Phillips' salary will be $2,500 per annum.

Calendars

The Bawden Machine Co., Ltd., Toronto, are giving away what they right describe as a beautiful art calendar. is a most graceful and charming feminine creation by Mr. Frank H. Desc called 'In Meditation Sweet.' There the same contrast of strong colors, t same graceful line, the same luxury tone, the same beauty of modeling, t same exquisite coloring in the face a hair as in 'Lady Caprice,' by the sa painter. The Bawden Machine Co. themselves credit by issuing such a spl did calendar.

The Cleveland Twist Drill Co., Cleland, Ohio, have tried to make t calendar the most attractive and us yet issued by a tool manufacturing cern. This will be sent, postpaid, firms making a request, consistent the limited edition. At the back of calendar some valuable data is given garding drills and taps, with miscell ous tables. Among the latter wil found a list of decimal equivalent drills in stock, cutting speeds, and lists for various taps.

Winnipeg, Man., seems to be the city in Canada that has published a endar and sent it broadcast over Dominion. It is not a work of ar any means, but its statistics are ar ed in such a manner that one see mediately, for instance, that the o

of its factories has gone up from $8,606,248 to $39,400,600 in ten years, and that in the same period the bank clearings have risen from $188,370,033 to $1,500,000,000. Eight photographs give glimpses of the city's thoroughfares and parks.

Catalogues

The Vulcan Engineering Sales Co., Chicago, have issued a bound set of bulletins illustrating the several styles and sizes of Q.M.S. cold metal sawing machinery for which they are general sales agents.

Engineering Works of Canada, Ltd., Montreal, have sent us catalogue No. 1 dealing with the firm's line of open type induction motors, in sizes from ½ to 200 h.-p., built with squirrel cage or slip-ring rotor as desired. These motors are built to conform with the specifications of the A.I.E.E., and full details of their construction are given.

A 40-page catalogue, No. 90, entitled Lever Punches and Shears, has just been published by the Watson-Stillman Co., 50 Church Street, New York. Many types of punches and shears are illustrated and fully tabulated. A few screw punches and power-driven machines are also shown. Nine pages are devoted to fittings and repair parts. A free copy will be mailed on request.

The first thing that strikes one on looking at the calendar of the Canadian Tungsten Lamp Co., Ltd., Hamilton, Ont., is that the light from their lamp is intense and above the average. This effect is secured by the picture of a female figure, who holds in her right hand a "Nulite" lamp, and with her left hand shields her eyes from the glare. The background is of azure and green, which gives the white light of the Tungsten lamp a dazzling effect.

John M. Henderson & Co., Aberdeen, Scotland, favor us with three of their lists, dealing with Hand Derrick Cranes, Electric Jib Cranes and Steel Rope Suspension Bridges. Quite a number of photographs are used in the first of these, showing the uses to which hand derrick cranes may be applied. There are also a number of drawings. The other lists are not so extensive, but are quite as interesting, particularly that dealing with suspension bridges.

National Alloys, Ltd., Ilford, London, E., Eng., manufacturers and founders of high class engineering alloys, send us their latest list, with new information of use to those who employ alloys in their works. Although this booklet has a distinctly catalogue appearance, it abounds with instruction, invaluable to foundrymen.

The Mahr Fuel Oil Burner Co., Minneapolis, Minn., in their latest pamphlet prove, apparently beyond doubt, that their burner gives a solid compact hot blast or flame, whereas the ordinary burner with a single combustion chamber, has a flame with a cold centre. They illustrate the effect by means of two drawings. Excellent photographs show the use to which the Mahr burner can be put in the machine shop or foundry, and the car department, for burning the paint off coaches.

Tallman Brass and Metal Co., Hamilton, Ont., have prepared a neat catalogue, showing exactly what they handle in the way of sheet brass, sheet copper, brass and copper tubing, brass rod—round, hexagon, square and rectangular, etc. It contains useful information, consisting of tables of weights and measures on brass and copper materials, which will be helpful in estimating. Attention is also called to their stock of Arctic metal, tin, lead, antimony, ferrules, nipples, unions, oakum, waste, clean outs, gas cocks, solder, metals, etc. Their slogan is: "Tallman's reputation is in the goods."

The Bath Grinder Co., Fitchburg, Mass., have favored us with a copy of their booklet—Useful Grinding Information. It has been prepared to show how certain operative features distinctive on their Universal Grinding Machine are used to advantage; to aid those confronted with grinding problems; and to assist those not familiar with grinding wheels to understand them. The first portion of this work is used to show how to grind cutters, and reamers. For each operation, an unusually instructive photograph is used. The second edition is devoted to Grinding Wheels and concludes with a page of "Don'ts," and a list of tables of interest to grinders.

Can. Westinghouse Co.—It is a pleasure to take up one of the neat bulletins issued by the Canadian Westinghouse Company, Ltd., Hamilton, Ont., dealing with any of their products. The covers are inviting, the paper is of first class quality, and the reading matter and illustrations always clear and interesting. This one, dealing with the serviceability of their motors, appeals to the farmer, the woodworker, the machinist, and the printer, giving examples of the use of the electric motor in their trades. Another bulletin on **"How Westinghouse Small Motors Can Help You,"** contains suggestions for saving time and labor in homes, hotels, restaurants, offices, stores, shops, and on the farm. The same concern have sent us a work by Mr. F. E. Wynne, on **Economics in Railway Operation**. Among the subjects treated are:—1. The discussion of field control for speed regulation, and 2. the matter treating of the correct application of motor equipment for a specific purpose. It is a reprint of paper read by Mr. Wynne before the Baltimore section of the American Institute of Electrical Engineers.

The Hawley Down Draft Furnace Co., Easton, Penn., are issuing a well printed catalogue, which clearly describes the various interesting features of the Hawley (Schwartz) metal melting furnaces. This catalogue is more especially devoted to the presentation of the advantages that the Schwartz furnace offers in the melting of small heats of iron and steel. It is in the melting of these small heats, for which the Bessemer and open-hearth furnaces are unsuitable, that the particular field of usefulness claimed for Hawley (Schwartz) furnace lies. This furnace is somewhat similar in outside appearance to a small Bessemer converter, the metal being first melted in a cupola, as in the Bessemer process. The subsequent conversion of the charge into steel, however, is carried out, as in the open hearth process, by the heat of a gas or oil flame playing over the surface of the bath of metal. Pouring is done either into ladles or directly into moulds. In cases where it is easier to move the furnace to the flasks than to bring the flasks to the furnace or to resort to ladles the company make a special type of furnace that can be readily disconnected and lifted off its housings by a crane and carried up and down the aisles of the pouring floor.

STEEL-COPPER TUBES.

STEEL for welded tubes has been made with small amounts of copper, in order to get the advantage of lower corrosion, but difficulty has been met with in the welding operation, and little progress has been made in consequence, although the alloy seems to have value. Copper has also been used to the extent of 0.25 and 0.30 per cent. in rail steel, and this metal is now in the track undergoing test.

The real reason why construction work has been suspended on the extension of the Grand Trunk Railway to Providence, R.I., has at last been discovered. It appears that the draftsmen who are plotting the surveys have not yet been able to spell Lake Chaubunagungamaug. A Welsh draftsman has been cabled for.

The General Market Conditions and Tendencies

This Section Sets Forth the Views and Observations of Men Qualified to Judge the Outlook, and With Whom We Are in Close Touch Through Provincial Correspondents.

Toronto, Feb. 12.—The market for machinery in Toronto last week was just as dealers like it. There was a good even demand for all-round equipment, with no startling orders like that placed by the Ford Motor Co. some time ago. The tendency is towards small lots, but there are plenty of them. The biggest order came from the Moncton shops of the Transcontinental Railway, and dealers are eager to know where the larger order for the shops at Transcona is going. The demand is for a high-grade class of machine, because manufacturers are putting in machine tools with a view to increased production. One house reports an exceptional demand for Yale and Towne chain blocks.

The prospects for marine accessories for the fitting out of vessels for the coming season are rosier than usual, which goes to show that more attention is being given to higher grades of these commodities.

Sales have been large to the mining trade. The Great Western Iron and Chemical Co., of Prince Albert, Sask., have had representatives in Toronto recently buying heavily of machine tools and equipment for their new plant.

Judging from the number of new plants being installed in this province, buyers should be plentiful early in the spring. The National Tube Co.'s new plant at Fort William will be ready by the fall. The Brown Boggs Co. will soon erect an addition to their plant; an automobile factory is planned for Galt; tools are required by the Petrolea Valve Cap Co., who are rebuilding, and the Steel Co., of Canada, are extending. As will be seen from our industrial development section this week, the demand is country wide, and dealers should anticipate a rush on them before the spring has fully arrived.

Pig Iron.

Foundrymen who happen to have a stock of pig iron on hand are making the best possible use of it in the hope that before long the price of this commodity will go down. The purchasing agent for one of the largest concerns in this part of the Dominion says that he bought rather heavily in pig iron some time ago, and admits that if he were in need of more now he would wait, being convinced that a cut was coming. He visited Pittsburgh recently, where he found the same feeling to prevail.

The Toronto representative of an Ontario firm of pig iron manufacturers says that he would not be surprised to see a drop take place in price, but did not think this would occur within six months. The demand is good, and most domestic furnaces are sold up for six months or more. The present year will see the world's production of pig iron reach its maximum.

Plates, Tubes, Structural Steel.

There is a heavy demand all over the country for plates, boiler tubes and structural steel. In Toronto and district the demand is coming from builders and bridge makers and agricultural implement concerns, all of whom have recently booked large orders. One steel house here has reduced the price of its steel bars and structural shapes for warehouse import—freight and duty to pay. These were respectively 2.05 and 2.15 cents a pound, and have been reduced to 1.95 and 2.05 cents. The cut resulted in a big increase in business.

Sheets, Plates, Bars.

Sheets, plates and bars are in demand, and the mills in the States are fully booked for this year in these lines. Bars are firm, and Canadian mills will be unable to ship in most lines under two or three months. The outlook suggests to buyers that the wisest policy would be to place their specifications early, and the same might be said regarding machine screws, nuts, bolts, wire, etc.

Metals.

The metal market is dull and unsettled. Practically no business is being done owing to the weakness existing. During the week the price of copper ingots dropped to a fraction below 16 cents in New York. Local dealers believe this to be the lowest possible. A reaction in this market was cabled from London on Monday, but it is believed that a rise, if it takes place now, will be very gradual. It is a year since copper was at such a low ebb. The same condition is to be found in the market for other metals and for old material. Those who have the latter on hand are holding for a rise.

Coke.

The price of coke remains unchanged. Coal has been rather difficult to obtain owing to the embargo on freight coming into the country over the Grand Trunk via Black Rock and Fort Erie, but a remedy for this congestion is in sight. Nearly a thousand cars of coal were held up at the border.

The report from Hamilton that the United States Steel Corporation had acquired the Canada Steel and Wire Co., and that the plant would be removed to Sandwich, Ont., was confirmed by the Toronto representative of the Steel Corporation this week.

Trade Gossip

The Dominion Coal Co. are to install at their new coal docks at St. John, N.B., four vertical submerged tubular boilers, built for 150 lbs. working pressure by the International Engineering Works, Ltd.

The Montreal office of the International Engineering Works, Ltd., builders of Robb engines, boilers, etc., has been changed to No. 1001 Transportation Building, Montreal.

The Canadian Car and Foundry Co. have recently purchased for their new car shops at Fort William, Ont., a 375 h.-p Robb vertical two-crank compound engine for direct connection to a 250 kw. electric generator. This engine, the latest design of Robb vertical compound engines, is to operate at 360 revolutions per minute. It is being built by the International Engineering Works, Ltd., manufacturers of Robb engines, boilers, etc.

Refrigerating and Engineering, Ltd., Somerset Block, Winnipeg, Man., have been appointed agents for the Terry Steam Turbine Co., Hartford, Conn., for the territory represented by Manitoba, Alberta, and Saskatchewan. The Terry Company already have agents at Toronto and Montreal, Canada.

The Siemens Company of Canada, Ltd., have obtained the order for a 400 K.V.A. 200 r.p.m. 3-phase, 60 cycle, 2200 volt generator, with direct coupled exciter for the Corporation of Yorkton, Sask. As in the case of the previous generator supplied by them, the 400 K.V.A. machine just mentioned above will also be direct coupled to a Diesel engine manufactured by Mirrilees, Bickerton & Day of England, who are represented in the Dominion by the Canadian Boving Co., of Toronto.

PULP WOOD EXPORT.

CANADA'S exports of "mechanical wet pulp of wood" to Great Britain during 1912 amounted to $375,945, a decrease of $432,225 in comparison with 1910, while those from Newfoundland indicate an increase of $226,000, doubtless due to the increasing output of the Harmsworth mills. Great Britain's annual imports approximate $5,000,000. Imports from Sweden have advanced annually from $567,185 in 1907 to $1,017,540 in 1911.

SELECTED MARKET QUOTATIONS

Being a record of prices current on raw and finished material entering into the manufacture of mechanical and general engineering products.

PIG IRON.

	Per Ton.
Foundry No. 1 and 2, f.o.b., Midland	$21 00

PRELIMINARY ARRANGEMENTS FOR FOUNDRYMEN'S CONVENTION.

MR. James Wood, of the Sheffield Foundry Co., Chicago, was re-elected president of the Chicago Foundrymen's Club at the annual meeting held on January 11. L. C. Young, of the McDowell Foundry Co., Chicago Heights, was elected vice-president, and C. E. Hoyt, of the Lewis Institute, was re-elected secretary-treasurer. The following directors were also elected unanimously:—E. F. Axner, C. B. Carter, Henry Vrooman and J. G. Garrard. The nominating committee included A. M. Thompson, E. W. Smith, E. J. Welsh and William Pederson.

At a meeting of the board of directors held at the City Club on Thursday evening, January 16, many important plans were made for the ensuing year, including the appointment of standing committees. O. J. Abell was appointed chairman of the programme and education committee, and C. B. Carter, chairman of the entertainment committee.

In conjunction with the Association of Commerce, the Chicago Foundrymen's Club will have charge of the entertainment and other similar features connected with the Convention of the Allied Foundry Associations to be held in Chicago early in October.

CANADIAN TRADE OUTLOOK BRIGHT.

NOTWITHSTANDING the fact that the Canadian trade figures for 1912 constituted a record in the history of the Dominion, in view of the unparalleled activity which abounds in every industry, continued increases in Canadian trade may be expected in the immediate future. The annual report of the Deputy Minister of Trade and Commerce, just issued says:—

"In my last annual report I ventured the opinion that the large increase of $76,232,684 shown in the total trade of Canada for the fiscal year 1911 over that of 1910 would be exceeded when the fiscal year 1912 closed. This prediction has been amply borne out by subsequent returns, the total imports and exports for the last fiscal year amounting to no less a sum than $874,637, 794, the largest volume of trade for any one year in the history of Canada. This was an increase over the year 1911 of $105,193, 889, or 13.6 per cent. It may be of interest to observe that the total trade of Canada for the last fiscal year was more than double the trade of only ten years ago. The increase in that time amounting to $470,727,350 or 106.3 per cent.

NEW SYSTEM OF EXCITATION.

IN some recent hydro-electric developments, a new system of excitation is being used. One small motor-driven exciter set is put down for each generator unit. The exciter terminals are connected directly to the respective generator fields, and the capacity corresponds, to that required by each generator. The motors of the various exciter sets are fed from one or two low voltage generators, driven by independent prime movers. Means are also provided so that the motors, if necessary, may be connected to the main bus, two separate sources thus being provided for their operation.

Mr. M. J. Keene, late of the Messrs. Pratt & Cady, of Boston, has taken charge of the valve and steam department of Messrs. Fairbanks, Morse & Co., Toronto.

Mr. Abram Wilbur Mace, the genial representative of Factory Products, Ltd., Toronto, is away on his honeymoon. His wife was Miss Edna Hayes, of Toronto.

U.S. IRON ORE PRODUCTION IN 1912.

FROM returns received up to January 24th last, the United States Geological Survey Department estimates that the total quantity of iron ore mined in the United States in 1912 was between 54,500,000 and 57,500,000 long tons. This quantity represents an increase of between 25 and 32 per cent. compared with the production in 1911, which aggregated 43,550,633 tons. It is, therefore, possible that the high record of iron ore output attained in 1910, viz., 56,889,734 long tons, may be slightly exceeded, although the returns received up to the date mentioned above, which are only approximate figures, are not quite sufficient to justify a definite comparison with the figures of 1910. In the Lake Superior district the production of iron ore apparently increased in slightly greater proportion than the average for the country at large, the total shipments having increased from 32,783,163 long tons in 1911 to nearly 48,750,000 tons in 1912, but there were very large stocks of ore, amounting to more than 11,000,000 tons at the mines in the district at the close of 1911, and these stocks may have been depleted in making the record shipments of 1912.

Production in the Birmingham district, Ala., was largely increased in 1912, especially through the large output of the Red Mountain group of Clinton hematite mines operated by the Tennessee Coal, Iron and Railroad Company. The production in Tennessee, North Carolina and Virginia apparently has not greatly increased, if at all, above that of 1911, probably because some of the blast furnaces in these States dependent on local ores were not in operation during the early part of 1912, and in the South the inactivity of blast furnaces is quickly reflected in the operation of the iron mines.

"CANADIAN MACHINERY"
A Weekly

¶ We had no apologies to offer for the first issue of "Canadian Machinery" as a weekly, which was mailed from this office last week.

¶ We feel justified, however, in taking considerable pride in the present number, both as to editorial contents, and in amount of advertising carried.

¶ Every advertisement in this issue is run under contract and paid for at our regular card rates.

¶ Particular attention is directed to our "Industrial News" section, in this issue, in which is given particulars re many new developments which will mean business for those having engineering product to dispose of.

¶ Our market department also shows some development in this number, but future issues will show a more marked development, both as to number of lines covered and in territory from which these reports are gathered.

¶ Readers will profit by giving each issue a careful examination as soon as convenient after receipt of their copy.

¶ If **you** find this journal useful, tell your friends about us.

¶ We will appreciate suggestions or criticisms from both readers or advertisers.

You Pay Only Once For This Stool

How often do you have to buy stools for your factory? Let us show you one that never wears out.
This stool is made of angle steel, the strongest material for the purpose, and the seats are nicely finished in polished hardwood.
One of our many customers writes:—"The two stools you supplied us with last July have given excellent satisfaction and we will replace all our wooden stools with your goods as our requirements demand. In the meantime enter our order for two dozen 18 inch.
Write to us for catalog containing details, illustrations and prices.

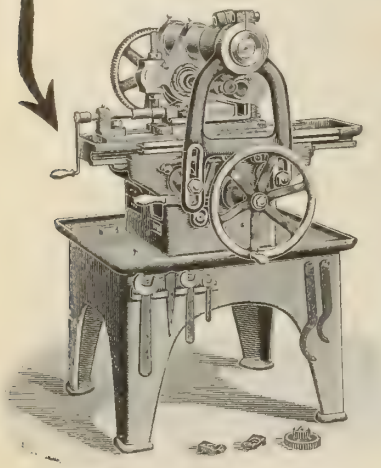
Not an Enterprise for the "Quitter"

¶ "If there is one enterprise on earth," says John Wanamaker, "that a 'quitter' should leave severely alone, it is advertising. To make a success of advertising one must be prepared to stick like a barnacle on a boat's bottom.

¶ "He must know before he begins it that he must spend money—lots of it.

¶ "Somebody must tell him that he cannot hope to reap results commensurate with his expenditure early in the game.

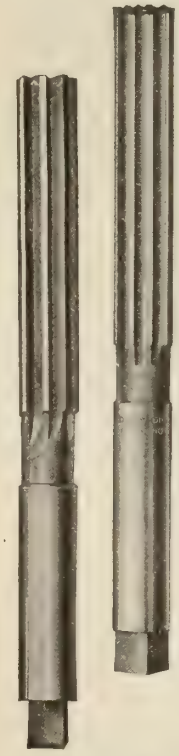


¶ "Advertising does not jerk; it pulls. It begins very gently at first, but the pull is steady. It increases day by day and year by year, until it exerts an irresistible power."

This Milling Machine produces parts of machines, tools, typewriters, phonographs, guns, electrical instruments, etc., accurately and at a rapid rate.

In manufacturing such pieces the advantages of a machine of stiff construction and convenient design, so that it can be rapidly operated, are highly important. Such advantages are to be found in the

No. 12 PLAIN MILLING MACHINE



A careful study of the illustration reveals the strong, compact design of the machine, as a whole. Note the length of the table bearings; the solid spindle head that contains the spindle bearings; the massive overhanging arm, intermediate arbor support, and braces that bind the arbor and overhanging arm solidly to the base of the machine. All these points conduce to great rigidity and consequently to accuracy in producing work at fast rates.

In connection with the convenient arrangement of parts to facilitate quick manipulation, note the handy position of all controlling levers and handwheel at the front of the machine. The longitudinal table feed is automatic in either direction and the length of traverse is controlled by adjustable dogs that disengage the feed at any desired points. There are six changes of feeds, some of which are suitable for every requirement of finish and production.

"W.&B." Diamond High Speed Twist Drills

In COMMERCIAL TEST—Every Day Shop working conditions—they reduce factory costs wherever used. A few reasons are due to:

1.—The Right Percentage of Vanadium in the steel Minimizes Crystallization, Overcomes Gathering, Prevents Oversize and Tearing the Stock.

2.—A High Percentage of Vanadium in "W.&B." High Speed Steel Acts as a Cleanser and Produces a Steel with the Grain Very Close.

3.—The Tang of "W.&B." Drills is Deeper, Giving the Drill More Bearing in Sockets and More Driving Power.

Compare the "W.&B." Trade Marked Twist Drills and Reamers with the Drills and Reamers you are using.

Jobbers in all large cities will supply or write us. Catalog No. 82G.

The Speed, Strength, Convenience, Accuracy and Durability of Our

16-in. "Economy" Engine Lathe

Makes it an Absolute Necessity to the Progressive Shop

This is a powerful Double Back Grand Lathe, represents the highest standard of workmanship and design.

Its special features make it applicable to a wide range of work

The gear box is simple. Three quick changes of feed are obtained for each change of gearing.

Give this improved machine a place in your shop—improved machinery makes the world progress.

Write us for full particulars to-day.

Rockford Lathe & Drill Co., Rockford, Ill.
1827—14th Ave.

Canadian Representatives: A. R. Williams Machinery Co., Montreal, Toronto, Winnipeg and Vancouver.

Which Journal do you use when in the market for Shop Equipment or Supplies?

THIS Directory is run every month at considerable expense for the benefit of our readers—*your* benefit.

¶ You will find listed practically every machine shop or foundry requirement, from twist drills to coach wheel lathes, and from foundry facings to cupolas.

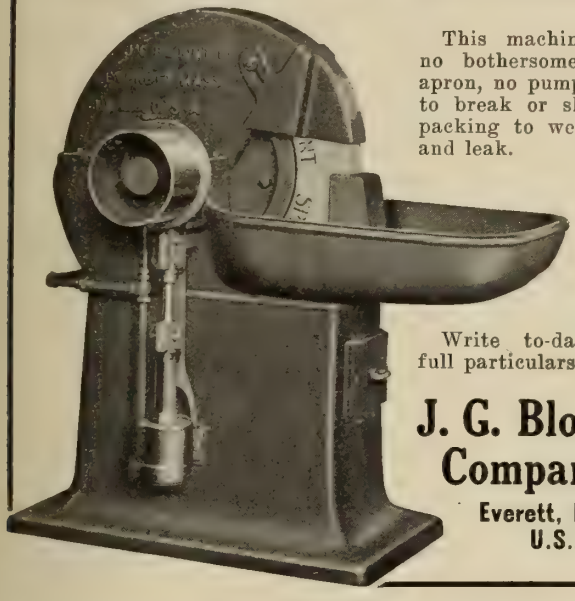
¶ You will find under each heading from one to a dozen names of reliable firms anxious to furnish information for the asking.

¶ Turn from this directory to our advertising pages and study carefully what our advertisers say regarding their product.

¶ You do not derive half the possible benefit from any one issue of Canadian Machinery unless you study the advertising pages.

¶ The most progressive firms *believe* in advertising, and these are the firms who are constantly employing the best designers in order to keep their product thoroughly up-to-date.

¶ In his space, the man who is spending his life perfecting his product, tells you briefly about a few of the outstanding features. It is your privilege to write and get *complete* information, and that information is going to help you get better results.



Refer to Canadian Machinery Directory and Advertising pages---you will help us, the advertisers and yourself.

YOU CAN SAVE MONEY

By Using Our

30" Improved Wet Tool Grinder

It Will Give a Service That is EFFICIENT, RELIABLE and ECONOMICAL

This machine has no bothersome drop apron, no pump belts to break or slip, no packing to wear out and leak.

Write to-day for full particulars.

J. G. Blount Company
Everett, Mass.
U.S.A.

Steel Hoists Never Break

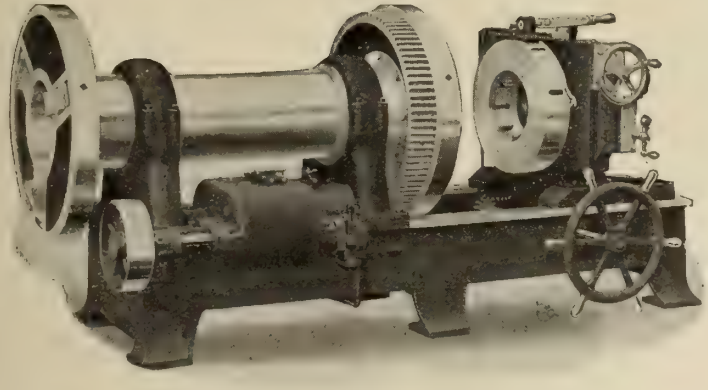
Mr. Foundryman:—

Did you ever notice that your competitors who are equipped with hoists and light overhead travellers are the hardest ones to compete with?

Did you also notice that they are the ones who get the best contracts?

WHY? WHY?

Because they are in shape to do the work and their customer don't have to wait on them to get ready.



Make Your Start Now

Plan your line of equipment and put in a hoist or traveller now. You will never regret it.

Our STANDARD HIGH SPEED HOISTS will meet your every requirement.

Wright Mfg. Co.
Lisbon Ohio, U.S.A.

TAKEN AS A WHOLE, THE "B & K" LINE

is the most massive and rigid of pipe machines, and the only machine built with the PEERLESS die-head.

Equipped with such labor saving and cost cutting devices as modern practice has shown to be essential to the rapid production of pipe work.

INVESTIGATE TO-DAY.

BIGNALL & KEELER MFG. CO.

EDWARDSVILLE, ILL.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

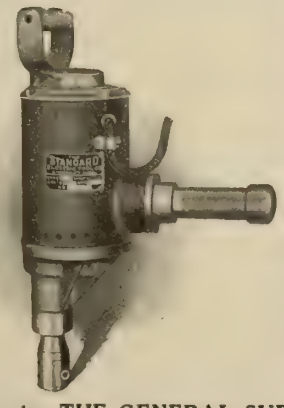
Made In Canada

The above illustrates a 15 KW Spot Welder for welding from No. 30 to No. 10 ga. sheet metal.

We make other sizes and types of Butt Welders, Spot Welders and Special Welding Machinery.

Ask for catalogue showing full line of Electric Welding Machinery.

AGNEW ELECTRIC WELDER CO.,
WALKERVILLE, ONT. Limited



HIGH POWER UNIVERSAL PORTABLE ELECTRIC DRILLS

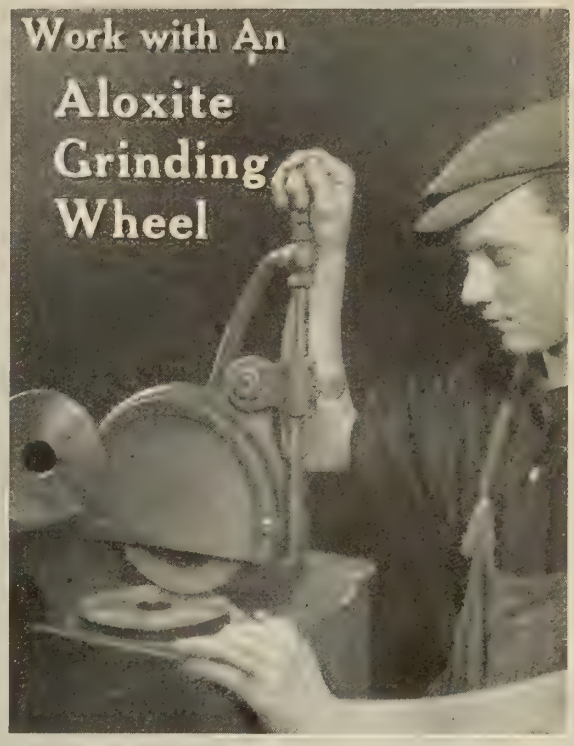
Operate on 25, 40 and 60 Cycle Current as well as on Direct Current.

Highest Quality Throughout

Manufactured in 1/4", 5/16", 3/8", 1/2", 3/4", 7/8", sizes.

Simple, Strong and Rigid Mechanical Construction.

Ball Bearings in all Drills.



Our Universal Drills do not race when running idle or under light load.

Write for Test Report and Bulletins U-7, G-5, and D-8. Drills and Grinders in various sizes for both **alternating** and direct current.

THE STANDARD
ELECTRIC TOOL CO.
CINCINNATI, OHIO, U. S. A.

It's Like Putting an Old Head on Young Shoulders—to have Him Work with An Aloxite Grinding Wheel

THE right wheel in the right place enables this operator to turn out accurately surfaced—perfectly finished—hardened Scottish steel collars.

The wheel is so good that he not only produces one-third more work, but better work than ever before.—With more experience the results would be even better.

The wheel lasts half again as long as others—doesn't fill—holds its grinding face.

Good grinding judgment upholds the theory of having *the right wheel in the right place*—of consulting our service department.

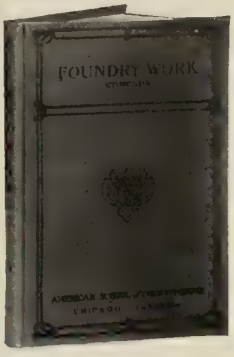
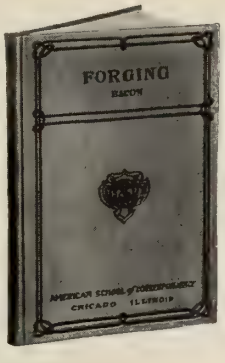
Mechanical Engineering Books



If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.

MACHINE-SHOP WORK. By Frederick W. Turner, Instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price ...$1.50

MECHANICAL DRAWING. By Ervin Kenison, S.B., Assistant Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price $1.00



FOUNDRY WORK. By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 142 illus. Cloth binding. A practical guide to modern methods of moulding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price $1.00

PATTERN MAKING. By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price $1.00

MACHINE DESIGN. By Charles L. Griffin, S.B., Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price $1.50

FORGING. By John Lord Bacon, Eng. and Supt. of Construction, with R. P. Shields & Son, San Diego, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working handbook of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price $1.00

TOOL MAKING. By Edward R. Markham, Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers, Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels —annealing, tempering, spring tempering, hardening, case-hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandrels, taps, hobs, reamer and tap-holders, jigs, gauges, dies and die-holders of all kinds, counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price $1.50

Sent postpaid on receipt of price. We can also furnish you with other standard works on Engineering in all its branches, including books for Civil Engineers, Contractors, Electricians, Foundrymen, Steam Engineers, Mechanical Engineers, Municipal Engineers, Railroad Engineers, Sanitary Engineers, Gas Engineers, Hydraulic Engineers, Technical Men.

THE STRONG AND POWERFUL NAZEL-BÊCHÉ AIR HAMMER

FOR GENERAL FORGING AT LOW COST

The Nazel-Bêché (Hammer and Compressor combined) can be installed wherever belt or electric power is available; and is the most modern reliable power driven substitute for the steam hammer.

Owing to its uniform speed, positive control and hard blow, it has a higher efficiency and greater capacity in relation to ram weight, than either steam or ordinary power hammers, with a decidedly lower operating cost and upkeep.

For general forging the Nazel-Bêché is the ideal hammer, as it consumes power only when running. It does not require any working out, but starts up immediately as soon as belt is shifted or curent turned on, and maintains the same speed from start to finish.

Over 2,000 of these Hammers have been sold through the recommendation of users. And the reason is because it is the simplest, most durable and compact forge hammer on the market.

Sizes and normal capacities, belt or motor driven:

66 lb. 2" rd. | 165 lb. 4" rd. | 250 lb. 5" rd.
350 lb. 7" rd. | 500 lb. 8" rd
770 lb. 9" rd.

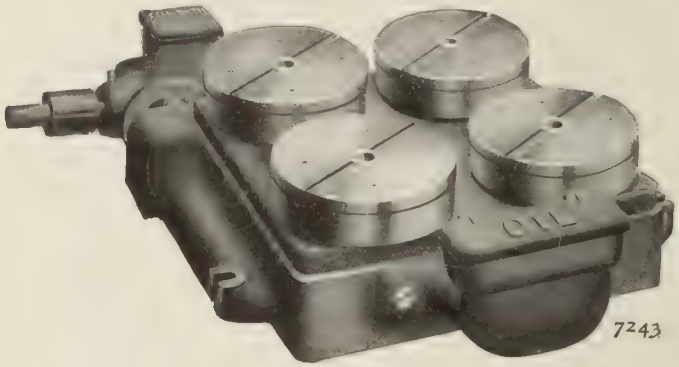
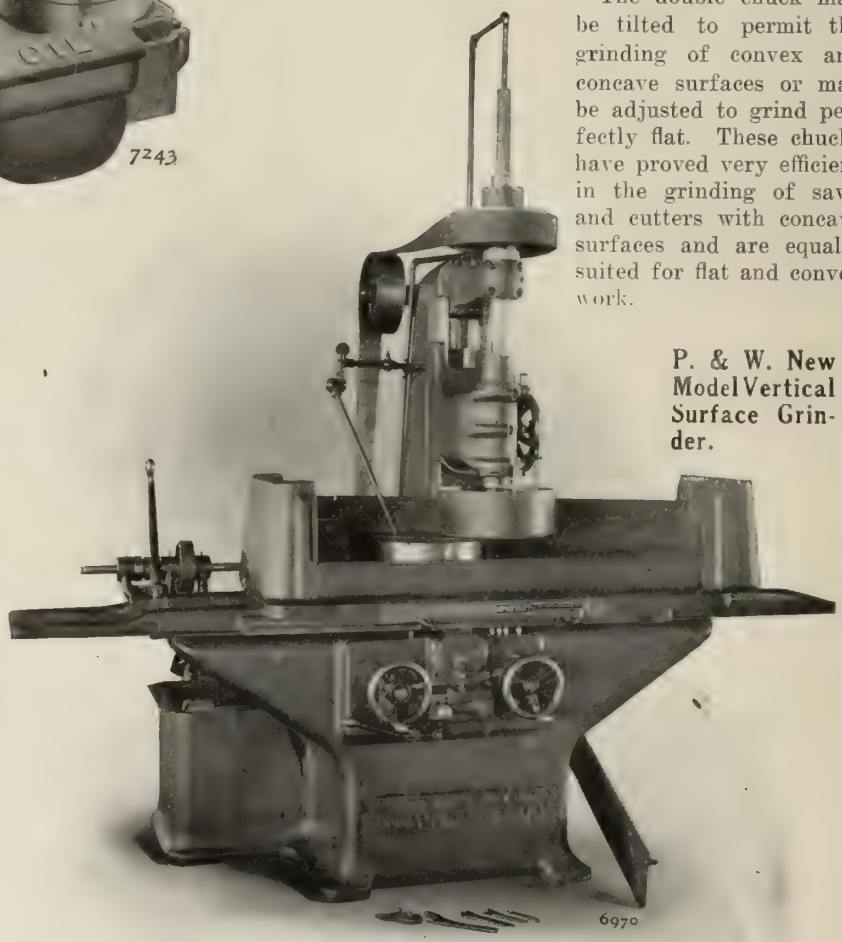
Output On Surface Grinding Doubled and Quadrupled

The well-known remarkable output of the



P. & W. New Model Vertical Surface Grinder

has been greatly increased by the use of double and quadruple rotary chucks. These chucks are most efficient, accurate and durable. They are absolutely dust and water proof. The driving mechanism engages automatically when the chucks are brought under the wheel and disengages when they are returned.



Double Chuck Handle Both Flat And Concave Work

The double chuck may be tilted to permit the grinding of convex and concave surfaces or may be adjusted to grind perfectly flat. These chucks have proved very efficient in the grinding of saws and cutters with concave surfaces and are equally suited for flat and convex work.

Quadruple Chuck For Greater Output on Flat Work

The quadruple chuck cannot be tilted but will give the greatest production on flat work such as gear blanks, washers, discs, etc.

P. & W. New Model Vertical Surface Grinder.

This Method Most Rapid On Circular Work

We have proved by shop experiments that there is no saving in grinding several pieces at once on a single chuck, over grinding one piece at a time, the single piece being placed at the centre of the chuck. With the former method, the piece only passes under the wheel once every revolution of the chuck, while with the latter the wheel is grinding continuously. By the use of two or four of these chucks at once, the production is doubled and quadrupled. Moreover, our method of continuous grinding keeps an even pressure on the piece all the time, assuring a perfectly accurate surface.

MOST POWERFUL MILLING MACHINE

(Knee Type)

GARVIN No. 22 Plain Milling Machine Compoun Geared. Use Code, "Apeirent."

The machine shown is the most powerful Knee Type Milling Machine manufactured by us, having Compound Back Gearing whose ratio is 10 to 1, through steel gears. It will transmit 10 horsepower to 14 inch cutters, running 20 revolutions on steel castings. The machine has a wide faced pulley of 11 inches in diameter, running loose on the spindle. The power is taken from the countershaft by a 6-inch double belt to this pulley and double-backed-geared back to the spindle. The machine has an arbor 2 inches in diameter, solid, with spindle, thus avoiding a lot of arbor troubles.

DIMENSIONS

Length of automatic feed of table.....28 in.
Dimensions inside of oil pockets...43½x9 in.
Vertical adjustment .....15½ in.
In and out adjustment .....7 in.
Crated weight .....3250 lbs.

Ball Bearings

Every feature in a SKEFKO Bearing has been worked down to the closest possible refinement, embodying simplicity, ruggedness, accuracy and the greatest load-carrying capacity. No parts can work loose, rattle or cause bearing failure. The retainer is but one piece of Swedish Lancashire Steel. It performs *right* and is proof against trouble. Moreover, it will not collect grit or other harmful matter.

SKEFKO is the only truly self-aligning bearing. This feature alone is worth most careful consideration.

The outer ball race is machined and ground to a radius struck from the centre of the bearing. The inner race is provided with two grooves, ground slightly larger than the radius of the balls. The balls, cage and inner race, retain precisely the same spacing with reference to each other at all times, and rotate as a unit within the spherical surface of the outer race. The whole constitutes a practically perfect ball and socket joint, capable of adjusting itself instantly and automatically to any spring of the shaft upon which it is mounted. Absolutely no cramping strains can be introduced on the balls, and the permissible arc of deflection covers a range that would instantly destroy a bearing of any other type.

Time and again automatic self-alignment, as obtained exclusively by this construction, has brought success with SKEFKO Bearings where rigid bearings had failed utterly.

SKEFKO Self-Aligning Double-Row, Double-Capacity, Double-Life Ball Bearings cost no more and are made in international standard sizes. Their use is practical under any speed and load condition and the lubrication and protective housing can be made to conform to any service requirements.

SKEFKO are the recognized standard and are replacing other constructions in many types of machinery.

Our literature explains these matters in detail. Your best interests demand that you investigate. Tell us your bearing troubles and ask for our bulletins.

The Application of Liquid Fuel to Foundry Practice

By W. N. Best

The author of this paper incidentally remarks that it is possible to install equipment for burning oil, yet to simply burn at it, with the result, of course, that the highest satisfaction is not obtainable. The necessary requirements for success in oil burning, relative to the furnace and burners are clearly and simply set forth, while the utility of the field for different foundry processes, is shown to merit a wider scope of service and application.

IT has been stated that oil is a very slippery subject, and a great many methods have been employed to burn it, but in visiting various works one comes to the conclusion that the plant is either burning the oil or burning at it. There is a vast difference between the two, and we will consider some of the methods of atomizing the fuel, distributing the heat and securing the proper admission of air in order to reduce oxidization to the minimum and to control the temperature.

Origin and Production of Petroleum.

We will first consider the origin of petroleum. Scientists tell us it is the decomposition of vegetable matter and fish during the antediluvian ages. It was first discovered in the United States in 1859 at Titusville, Pa. During the first year only 2,000 barrels (42 gallons each) were produced. Since then in each succeeding year the production and demand has increased. Last year the United States alone produced 220,449,391 barrels, or 63.80 per cent. of the total world's production. Russia produced 66,183,691 barrels; Mexico, now ranking third, produced 14,051,643 barrels; while the Dutch East Indies came next with a production of 12,172,949 barrels.

There are two kinds of petroleum—one having a parrafine base, the other an asphaltum base. Either may be used as fuel in its crude state, but both are largely distilled in order to obtain the more volatile oils, such as gasoline, benzine, kerosene, etc. The residuum is called fuel oil, and is used in every class of service where coal, coke or gas can be used. It is proving a most superior fuel, because the operator has the fire under perfect control and can attain and maintain the heat required at all times. The ultimate analysis of this oil is as follows:

	%
Carbon	84.35
Hydrogen	11.33
Oxygen	2.82
Nitrogen	.60
Sulphur	.90

Gravity from 26 to 28 Baume.
Weight per gallon, 7.3 lbs.
Calorific value varies from 18,350 to 19,348 B.T.U. per lb.
Vaporizing point, 130 degs. Fahr.

Analysis of Beaumont (Texas) Oil.

	%
Carbon	84.60
Hydrogen	10.90
Sulphur	1.63
Oxygen	2.87

Gravity—21 Baume.
Weight per gallon, 7.5 lbs.
Calorific value, 19,060 B.T.U. per lb.
Vaporizing point, 142 degs. Fahr.

Analysis of California Oil.

	%
Carbon	81.52
Hydrogen	11.01
Sulphur	.55
Nitrogen	6.92
Oxygen	6.92

Gravity varies from 12 to 36 Baume.
Weight per gallon, 7.6 lbs.
Calorific value varies from 18,462 to 20,680 B.T.U. per lb.
Vaporizing point, 230 degs. Fahr.

Oil tar is a by-product of the water gas system used in numerous gas works. Coal tar, again, is a by-product of coke oven benches. When either of these tars is heated sufficiently to reduce its viscosity, it makes a most excellent fuel. Per pound, their calorific value is less than that of oil, but as they weigh from 9½ to 10 lbs. per gallon, while fuel only weighs 7.3 lbs. per gallon, their calorific value per gallon is greater than that of fuel oil. Oil tar has a calorific value of 16,970 B.T.U. per lb., or 161,200 B. T. U. per gallon, while that of coal tar is 16,260 B. T. U. per lb., or 162,600 B. T. U. per gallon.

Requirements for Burning Liquid Fuel.

In burning liquid fuel it is very essential to have good refractory material for the furnace; in fact, I always recommend nothing but A1 fire-brick of a quality which will stand an abrasive heat as well as having scarcely any perceptible expansion. For the average furnace it is necessary to use skilled labor; in other words, the man who constructs furnaces should be thoroughly trained to this art; consequently inferior brick is always a bill of expense and a disappointment, as it costs as much in labor as a brick that will last three times as long.

The burning of oil is a science. It requires brains rather than brawn, and there is a vast difference between the two. It is necessary to have a burner, scientifically constructed, that will atomize any gravity of liquid fuel purchaseable in the open market, no matter whether the oil be volatile or heavy; so heavy, in fact, that it must be heated to reduce its viscosity. Burners should be of such construction that they will not carbonize, but attain and maintain the required temperature at the will of the operator. They should also be such that when applied to a furnace, mold drying or core drying ovens, they will fit the fire chamber perfectly. Without cutting away the fire-brick, they must deliver the flame and heat evenly throughout the length and width of the fire chamber.

A great many people imagine that they can mash down a piece of pipe and make a burner, at the cost of 15 or 20 cents, which will atomize the oil. In 99 cases out of 100 it is a type of burner that they have seen in some other works, where they were simply burning at oil, not getting efficient service, although flame was everywhere present, especially upon the outside of the furnace or in the oven. One thing has not been considered, and this is the fact that such a burner is wasting from 12 to 20 per cent. in fuel. At the price of liquid fuel at the present time we should consider the price of the fuel rather than the price of the burner. Strange as it may seem, I have often seen the same size and type of burner placed in the side wall of a furnace having charging space 6 feet square as in an 18-inch furnace, and, after applying one burner, if that did not give sufficient fire, they applied others, until as many as five burners have been installed.

I have one blue print, which I can produce to-night, showing a furnace in which 26 burners were used. Oil was condemned simply because the man is not yet born who can successfully operate one-third that number of burners in any size furnace. The point which I desire to bring out is that, in applying liquid fuel to any equipment, it is essential to know, first, the capacity of the burner, and, second, it is necessary to have the burner filed to spread a blanket of flame which will cover the entire hearth or charging space of the furnace, or which will throw a narrow flame through a heat chamber without any impingement upon the walls of that chamber. The United States Govern-

ment has issued patents to thousands of American inventors upon burners of more or less merit, but all may be designated as three types—first, internal mixer; second, external atomizer; and third, mechanical.

Burner Features.

The great difficulty and abuse in the burning of liquid fuel is that many of the burners do not thoroughly atomize the oil. Second, they are of such construction that they carbonize. Third, the burners are not each carefully fitted for the type of furnace or oven to which they are to be applied. Fourth, they may operate fairly well with a light fuel, but when it comes to burn heavy fuel, it cannot be used because the burners will not thoroughly atomize heavy oil. I contend that a burner is not worthy of consideration unless it enables the operator to burn any gravity of liquid fuel purchaseable in the open market, for no manufacturer should be limited to the purchase of one particular kind of fuel. A burner wherein the base of the fuel carbonizes over the fuel passage is absolutely worthless. A burner should be of such construction that it can be filed to make a long narrow flame or a broad flat shape flame, and each burner should be thoroughly tested, so that when it leaves the shop where it is made the manufacturer knows that it will fulfill the requirements for which it is being furnished. A burner having the oil orifice below the atomizer orifice and independent of same renders the most efficient service, because of there being no liability of the oil solidifying or carbonizing over the slot at the nose of the burner. A combustion chamber of adequate form and proportions for the uniting of the air requisite for perfect combustion, with the atomized fuel before it reaches the furnace proper, should be used on every furnace. This prevents the oxidization of the metal charged in the furnace, and also aids in forming a blanket of flame to cover the entire charging space; thus insuring, with the aid of the burner, the even distribution of the flame and heat.

Value of Liquid Fuel.

Liquid fuel is especially valuable in the equipment of air furnaces. First, for the reason that it makes a superior grade of metal, and second, you can produce the same kind of metal to-morrow, a week, a month, or a year from now as you can to-day. Furthermore, the various alloys are thoroughly mixed, and, whereas in some cases the fuel costs more than cupola practice, the better quality of metal offsets any difference in this direction. This style of furnace can also be used to a very good advantage in making semi-steel, the castings of which are especially adapted for automobile parts and wagon construction.

Iron and steel is more valuable if it is heat-treated, and in order to do this a very accurate temperature is required. Liquid fuel is ideal for this purpose. We are to-day releasing the strain from even cast iron castings. This is rather an intricate service, as it requires a very even distribution of heat, for otherwise the process would result in the cracking of the castings.

In brass melting furnaces in brass foundries oil, if properly installed, is the ideal fuel. An air furnace is used to reduce the old brass by burning out the zinc so that it can be run into ingots which the metallurgist can test, mark and place in piles, so that they can be charged into the crucibles in the furnace to be melted into castings. This type of furnace is very useful in large works. During years past many manufacturers have drifted away from the use of crucibles melting their brass in direct-fired furnaces, but as metallurgists are now prominent in nearly all plants, the manufacturers are fast returning again to the making of brass in crucibles. In a few more years crucibles will be used exclusively in the making of brass castings. It is, therefore, important to melt the brass as cheaply as possible. Oil is ideal for this purpose, whether in a one-pot furnace or a furnace wherein a number of crucibles are charged. Only one burner is required for operating a multiple crucible furnace for melting brass or other alloys.

In mold drying, core drying or japanning ovens there is no fuel that can compare with liquid fuel, because you can get an even distribution of heat throughout the entire length and width of the ovens. It is important to cut out the use of stacks on such equipments, but the moisture should be permitted to pass out of the top of the oven. By this method a great saving is effected in the construction of the oven. Where small ovens are used for core drying, etc., one burner to five or six ovens, of say 6 ft. square, renders better service than a single burner to an oven. Both cores and molds can be dried much quicker by the use of this fuel than with coal or coke, simple because you get an even distribution of heat, and not a localized heat.

Oil Supply And Demand.

While the production of oil has increased the demand has also increased. With the increase in its price we should give greater attention to securing the highest possible efficiency from every drop of fuel. For comparison, the analysis of one of the best coals may be of service. It is as follows:

	%
Carbon	82.26
Hydrogen	3.89
Oxygen	4.12
Nitrogen	.64
Sulphur	.49
Ash	8.60

Calorific value per lb., 15,391 B. T. U.

The average of good coals has a calorific value of 14,200 B. T. U. per lb.

—From a paper read before the Philadelphia Foundrymen's Association.

MANUFACTURE OF LOCOMOTIVE SUPERHEATER TUBES.

By J. P. Watson.

OF the new locomotives constructed in Canada during the past twelve months, at least 75 per cent. are equipped with a superheater of some kind, the majority making use of the Vaughan-Horsey form. The superheater units of this type are made of seamless steel tubing, 1¼ in. outside diameter and 15-16 in. inside diameter. The process of finishing these tubes, ready for the locomotive, as practised at the Montreal shops of the Canadian Pacific Railway is herewith described.

The tubes are obtained chiefly from Belgium, and come in ordered lengths with plain ends as shown at (A), Fig. 1. The first step is to upset one end to form the collar seen at (B), this being done with ordinary upsetting dies in an Ajax forging machine in the blacksmith shop.

FIG. 2.—MANUFACTURE OF SUPERHEATER TUBES.

From here the tubes go to the pipe shop for the remaining operations. As the finished tube requires a short right angle bend—see (D), Fig. 1,—provision has to be made to prevent flattening dur-

ing the bending operation. For this purpose the small iron plug seen at (C) is hammered into the end of the tube. The latter is then stood on end beside an elevated platform, and one of the two men who bend these tubes, pours sufficient dry sand through a funnel to fill the tube for about twelve inches from the bottom. The other man, in the meantime, lightly raps the tube with a hammer to make the sand settle compactly. After a batch of tubes is made ready in this way, they pass to an oil furnace, where the plugged ends are brought to a red heat.

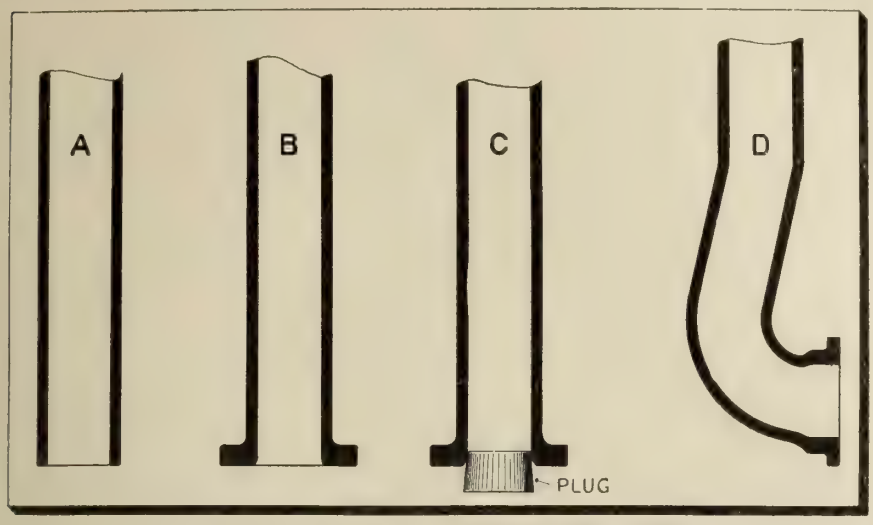

FIG. 1. MANUFACTURE OF SUPERHEATER TUBES.

The final bending is done under the 15-ton pneumatic press seen in Fig. 2. This is similar to those commonly used in railway shops for pressing in rod bushings. The main cylinder (E) stands vertically, and is supported on four turned columns, while mounted on the left hand side of the base plate is a 14-in. x 10-in. driving brake cylinder (F). The push rod of the latter carries a cast iron block fitted with an inserted hardened steel piece to form a die. A similar stationary block carries the other half of the die and forms a stop for the moving piece. These dies, when closed at the bottom, are open by the full width of a tube at the top. A third piece, fitting between the other two, carries the impression of the top half of the tube and is fulcrumed on the other two dies.

Bending the Tubes.

As a tube is withdrawn from the furnace, one of the men seizes the heated end with a pair of tongs and bends it through an angle of about 45 degrees. The other workman immediately inserts the collar of the tube in the dies under the press and admits air into the horizontal brake cylinder, thus securely clamping the tube. He then turns air into the vertical (main) cylinder, the descending ram of which forces down the third section of the die, completing the bending of the tube into the shape shown at (D)—Fig. 1. When the air is released from the main cylinder, this third die automatically rises, its lever being counter-weighted. The tube is released by letting the air off the brake cylinder. The iron plug usually falls out on releasing the dies, or is knocked out by tapping against the trestle on which the tubes are piled. Meanwhile the dies are blown free from scale and dirt ready for the next tube. When a batch of tubes have been bent, they are next cleared of sand by compressed air. The sand is blown into a small portable collector tank, thus keeping down dust in the shop and rendering the sand available for further use.

Each tube has now to be widened at the mouth, as seen at (D). For this purpose it is reheated and again placed under the press, where it is gripped by a pair of dies made to hold the open end up, instead of down as before. The vertical ram then pushes a punch into the opening, forcing it out to the full size at the mouth and giving the correct shape to the collar on the end.

Milling the Collar.

The next operation is the milling of the collars to exact standard size. For this purpose the tubes go to a machine arranged similarly to a small lathe having a cutter centrally located on the headstock. In place of a tailstock there is a revolving chuck which grips the tube end eccentrically and feeds it around the rotating cutter, finishing the collar on the face, rim and back.

All that now remains to do is to cut the tube to the length required. A bench is arranged with a stop at one end, against which the bent end of the tube is placed. At the other end of the bench is fastened a metal plate graduated to the several standard lengths used, so that each tube can be marked to length at a glance and immediately cut off in an ordinary pipe cutting machine.

Two tubes are next threaded and screwed into a cast steel return bend at 1¾-in. centres. They are then tested under hydraulic pressure and, if found tight, form one completed unit ready for delivery to the erecting shop.

High Power Milling Features and Developments

By H. Pearman*

Developments in machine tools are constantly in the direction of lower production costs which involve both the machine and the operator, since the two form the manufacturing unit. Increased output is gained by increasing the power and efficiency of the machine and simplifying the work of the operator.

HIGH-POWER millers are understood to indicate machines embodying the requirements for heavy cutting with coarse feeds; the term is not truly descriptive, since it does not refer to the power available at the spindle nose, and the user is more interested in what he obtains at that point than in what can actually be fed into the machine. It must be admitted that it is better if a given cut can be taken with a minimum of power beyond that required for the actual cut, since the excess must go towards wear out of the machine.—

Power Required to Feed.

Next in importance to power at the cutter, perhaps, is power required to feed, a mechanism which often is a large absorber. It is obvious, therefore, that large driving pulleys, wide belts, increased gear ratios, etc., do not necessarily indicate high power at the business end of the machine. Although the miller may be an efficient power transmitter, and no less so than other machines, its metal removing capacity per horse-power minute is much below that of the lathe or planer, and except for the miller's many advantages in other ways, it certainly could not compete with many other tools.

Wider Scope for the Miller.

This disadvantage has been somewhat removed by the high-power miller, and

*In Machine Tool Engineer.

the field for milling has been largely widened, as, with its greater capacity, combination of movements, and ease of control, a large amount of work can be handled which previously fell to the planer, slotter, facing lathe etc. Where repetition work is dealt with, the capacity of jigs and fixtures is increased and multiple gangs of cutters can be mounted, also heavier work is mounted in jigs than was formerly possible, so that the possibilities of economy are now much greater, even on work which previously could be done cheaper otherwise than by milling.

The question of relative costs is important in considering different methods, and a factor often overlooked in making comparisons is the effect of the grade of finish obtained. Assuming other things to be equal, if a milled surface means less labor in fitting or other subsequent operations, then economy is evident; unfortunately, comparisons are seldom carried beyond the question of price per piece off the machine.

To get the best results attention can profitably be paid to the material to be machined. Cast iron should be annealed, and if this is done, a harder grade of iron can be used , resulting in stronger, closer, and more easily machined castings; also pickling the castings will show a very marked result on the life of cutters. These remarks apply with special force to high-power milling. The present high-power millers are undoubtedly built a little more scientifically than some of their predecessors, and we do not find the discrepancies between various makes. The basis upon which these machines are built is primarily a given metal removing capacity, from which are deduced the requirements to give necessary rigidity and strength to the various mechanisms

Further requirements are ease of control and mechanical efficiency; the former is especially important, as the necessity for more intense work on the part of the operator must tend to lower the efficiency of the manufacturing unit.

Efficiency of Machines.

There is a great difference in the efficiency of machines of different makes, and the fact is important since the less efficient machines — although they have equal cutting capacity — absorb an excess of power which is constantly wearing out the machine.

A few points to look for in an efficient machine of this type are:—Absence of combined bending and torsion in shafts; absence of torsion in shafts subject to heavy loads; moderate gear and shaft speeds; minimum number of gears in action, no gears rotating which are not actually required for transmission; number bearing solidly clamped and not simply hung on a pin or hook; driving shaft relieved of belt pull. Supplementing these, there are, of course, considerations as to the combinations for the various bearings, i.e., both character and size, in order that the original accuracy may be maintained.

Forced lubrication is advocated by some makers, but it must be conceded that the milling machine is hardly a mechanism on which this can properly be employed, as the exclusion of foreign matter from the oil is practically impossible.

As already observed, power consumption is not of vital importance, but the miller would be appreciated more if its consumption could be brought to the level of, say, the lathe. These present-day machines are, however, so efficient that there is really little margin for material improvement, so that any substantial increase of efficiency must be effected through the tools. It is an acknowledged fact that better results are obtained from cutters with increased tooth space and depth; this lowers the power consumption, permits more work for one sharpening, and increases the number of possible sharpenings.

Chip and Chip Space.

The proportion between chip and chip space is an actual limiting condition, for immediately the amount of metal removed per tooth is sufficient to fill the chip space, enormous stress is thrown on both cutter and machine. This is very evident in gangs of cutters which have been in use some time and the chip space much reduced. With high-power millers the cutter details become of extreme importance, and many have a decided influence on the output of the machines.

There is no ground for the belief that finish can only be obtained with cutter teeth closely spaced. The grade of finish may be expressed as the distance between successive marks on the work, and these are revolution marks and not tooth marks. They are due to the cutter not being absolutely concentric, owing to minute errors, such as its being easy on the arbor, etc. On a first-class machine these errors are indivdually negligible, yet the accumulation may be sufficient to mark the work, and, of course, these marks need only be a fractional part of a thousandth of an inch to be plainly visible. As they are caused by conditions which recur once for every revolution of the cutter it is obvious that the tooth spacing has no effect on the distance between them.

Milling Cutter Comparisons.

A few comparisons between the standard and high-power milling cutters may be of interest.

A 2-inch diameter taper shank ordinary end mill has approximately three times the number of teeth as the high-power cutter of equal size. This means that the cutting action of the latter is remarkably free, as shown by the following test:—A 2-inch end mill milled a slot 1 1-16-inch deep in a solid block of cast iron at a rate of feed of 6 inches per minute. The block was clamped to the machine table and the knee fed upward, under which conditions the chips did not free themselves from the cutter, but were carried round and ground up, the cutter cutting over half its circumference. These conditions were about as difficult as possible, but there were no signs of choking, and the power consumption was no higher than it would be with a spiral mill under ordinary conditions.

The same cutter would remove from the end of a casting a section 1½ inches wide by 1½ inches deep at a feed of 11 inches per minute. In the case of the spiral mill a 3½-inch ordinary cutter would have about twenty-five teeth, while a high-power cutter of similar size would have nine teeth, corresponding to a pitch of about 1¼ inches; this gives a chip space four times that of the ordinary cutter. Stiffer arbors are necessary for these machines and cutters; a3½-inch cutter would require a 1½-inch or, better still, a 1¾- inch arbor.

Chip Breaker Feature.

An important point in this type of cutter is the form of chip breaker, by which duplicate cutters—one nicked and one plain—are obviated. The form of nick previously used provided rake on one side only, whilst the other side had a negative rake, resulting in a scratched work surface. To overcome this trouble, the chip breaker is now formed so that rake is provided on both sides of the nick, resulting in an equally good surface as that produced by a plain cutter.

The Helical Mill.

Another type of cutter developed largely since the advent of the high-power machines is the helical mill. The distinguishing feature is that it pushes the chip off in the direction of the axis of the cutter or at right angles to the feed. The power consumption for steel is extremely low; a roughing cut in steel requires only about one-third the power of an old style spiral mill.

Another feature of this cutter is the entire absence of spring in the arbor when cutting steel; it is possible to take a finishing cut, then to return the work under the revolving cutter without producing a mark. With a single cutter of reasonable width, end pressure is not found to be a disturbing element, but usually for widths beyond about 6 inches, the cutter is made in two sections, right and left hand, interlocking.

Insulation in Refrigerating Plant and Power House

By R. Campbell

The subject of thermal insulation is one of the most important to be considered in connection with the efficient operation of a refrigerating plant, and is of hardly less importance in a steam plant. This article is written by a refrigeration expert, and will therefore prove interesting and instructive. It will be followed in a future issue by a paper on the insulation of boilers and steam pipes.

THE subject of insulation is one which has had liberal treatment at the hands of technical writers. The articles, however, which have appeared on this topic have been treated from the standpoint of the manufacturer of some insulating material either in a manner too technical for the average engineer or owner, or they were written a few years ago and are therefore now obsolete.

Cold storage construction and insulation have been completely revolutionized during the past decade. The old air space construction is gone for good and also the method of using a packing material between wood construction. This was absolutely necessary for several reasons, chief among them being the fire risks attached to air space construction, the rapidity with which it deteriorates, the increased space occupied, and the ever increasing cost of lumber.

Economy of Good Insulation.

Pipe insulation seldom receives the amount of attention which it deserves. It is generally overlooked until the plant is ready for operation, the result being that it is hastily collected, and applied; and the appropriation for the equipment of the plant being in all probability exhausted, the cheapest material obtainable is often used.

It is now generally recognized that a good pipe covering, properly applied, will return its entire cost within one year from its application. A cheap and less efficient insulation will no doubt also return the outlay on it in a similar period, but at the end of this time it will probably be found that the good insulation is preventing double the amount of loss as the inferior one, and this from year to year during all the succeeding years of operation. The result is that each year the owner who has installed the inferior insulation has a positive loss amounting to at least half the initial cost of the good insulation. This illustrates the folly of endeavoring to save money by using cheap insulation. Is it a wonder then that owners and their engineers are now making provision in their initial estimates of capital expenditure for efficient insulation ,and are seeking for reliable data on this subject.

It is the purpose of this paper to discuss the materials and methods of insulation in a manner which should prove of interest and instruction to those who are seeking impartial information on the subject. The matter will be treated under four heads, not only to make reference easier but because under each head ,although the governing principle is the same, the materials used and methods of erection are altogether different. The divisions of the subject are as follows:—

1. Cold storage rooms.
2. Piping and tanks containing low temperatures.
3. Steam piping, boilers and heated surfaces generally.
4. Outside piping, underground and overhead.

Cold Storage Rooms.

The insulation of the cold storage building is probably the most expensive part of the plant, not alone in its initial cost but also, providing the work is not properly done in the power expended in making up for the loss incurred by poor insulation. It is therefore the part of wisdom for those who are building to make themselves familiar with the materials and methods of erection which have been proved satisfactory.

Corkboard or sheet cork is now almost exclusively used for cold storage insulation. It is made from the waste material produced in the manufacture of cork articles and also from the lower

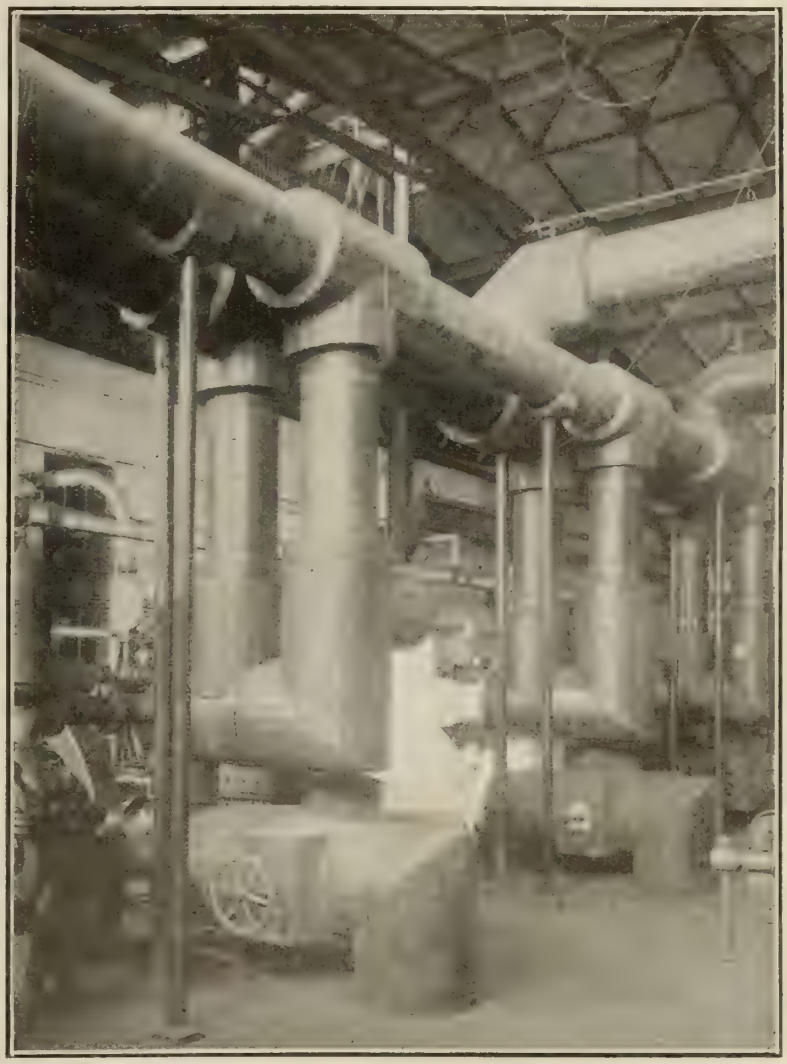

FIG. 1. CORK COVERING ON FLANGED BRINE PIPING AT STEEL CO. OF CANADA REFRIGERATING PLANT, HAMILTON, ONT. THE 8 IN. X 12 IN. SUCTION HEADERS ARE UNDER THE FLOOR.

grades of the cork-bark. This is crushed into granulated form, compressed in molds, baked and trimmed to the desired size.

About three years ago the patents on the process of manufacturing sheet cork expired, with the result that several companies are now manufacturing a good article and the price has come down to a point which makes it one of the few materials worth considering for cold storage work. It has proved its efficiency beyond question and it is now very widely used.

The owner should see that he gets material made from pure, sound stock, compressed and baked to the proper degree, and that it is erected under the supervision of some one who has had plenty of experience at this class of work. The vital parts of the work will be all hidden on completion, hence the necessity for conscientious and experienced workmanship all the way through. Corkboard is not proof against moisture penetrating into the spaces between the particles, it is therefore necessary to have an impervious surface on both sides of the insulation and especially on the outside, because insulating materials depend for their value on the minute air spaces which they contain. When the temperature of these is reduced the air pressure is also reduced, causing a partial vacuum into which the surrounding warm air endeavors to flow. Warm air generally carries moisture which would thus be deposited in the insulation, providing it can penetrate the surface, thereby decreasing its value and in time making it worthless. For this reason an impervious surface is required and this is the secret of efficient insulation for low temperatures.

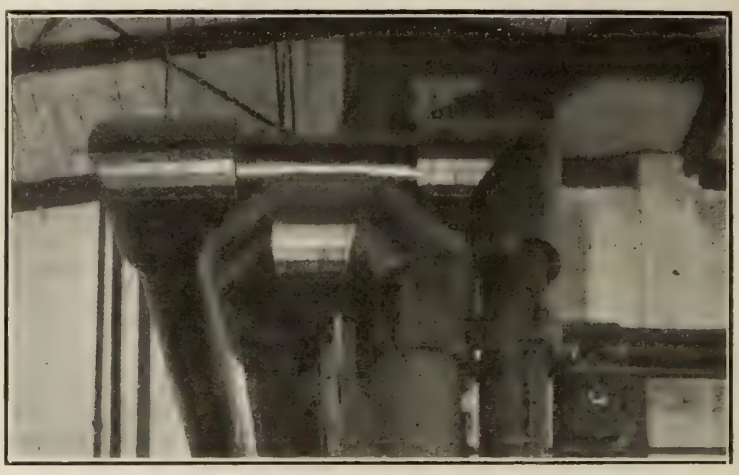

FIG. 3. A DIFFICULT PIECE OF PIPE COVERING. CORK COVERING ON 8 IN. X 12 IN. FLANGED BRINE PIPING.

FIG. 2. VIEW SHOWING TWO VERTICAL BRINE COOLERS (SHELL TYPE), INSULATED WITH CORK LAGGING. TOP AND BOTTOM BOXED IN AND FILLED WITH GRANULATED CORK, ALSO SHOWING 8 IN. X 12 IN. BRINE RISERS.

This surface can be obtained in different ways ,but preferably by a Portland cement plaster finish applied directly to the cork, which should be scored to receive the plaster, or by a coating of good bitumen. This is the chief point to be noted in the erection, whether it is on the walls, floors or ceilings. The methods of fastening will depend altogether on the conditions to be met, and each job must be considered by itself to give the best results.

Insulation Should be Embraced in Original Design.

In new buildings the insulation is generally left out of consideration until the framework of the building is completed. This is a great mistake. The insulation should be worked in with the general design and in some cases put in position with the framework of the building. A great saving can often be effected in this manner. The proper laying out of the room is another item on which economical results depend. Low temperature rooms in basements should be avoided on account of the danger of freezing the earth under the foundations. If moisture is present there is a possibility of heaving the building. This has frequently occurred with disastrous results.

The minimum thicknesses of sheet cork for the different temperatures to be carried are as follows:—

10 to 5 deg. F.	6 inches
5 to 15 deg. F.	5 "
15 to 30 deg. F.	4 "
30 to 45 deg. F.	3 "
45 to 60 deg. F.	2 "

Of course this will be governed to a great extent by local conditions, the construction and arrangement of the building, etc.

Sheet cork made by mixing granulated cork with some form of asphalt binders should not be used for cold storage work. Its cheaper price does not offset its lower efficiency as compared with pure sheet cork. Manufac-

turers make this grade to use up the trimmings of the pure sheets. The only place where it should be considered is on the floor of a comparatively high temperature room, where there is an excessive amount of water present.

Brine Ammonia Piping, Etc.

Brine circulating pipes and gas lines in connection with refrigerating plants, when these are outside of the space which they are to cool, brine coolers, brine storage tanks, and ice-making tanks, require to be insulated in order to maintain the low temperature within and also to prevent the "dripping" which occurs when the circulation ceases. This class of covering is the most difficult which confronts the engineer. The materials and methods employed are entirely different from those used on steam work. In the latter it is the material that counts; the manner of application in ordinary cases is not important except where a neat finish is required.

With brine work the position is reversed. The best materials obtainable are of little value unless carefully applied, and it is imperative that the finished surface be quite impervious to air and moisture in order to prevent the inrush of warm air into the insulation, as explained under the paragraph above on cold storage rooms.

It is also important that sufficient space be provided around the piping to be covered. At least three inches should be allowed, and where flanges are used, this same distance should be provided outside the flange. Where two brine pipes run alongside they should be at least 8 inches apart. Few erectors give sufficient attention to this point. It should be remembered that the covering cannot be applied satisfactorily when the plant is in operation.

Hair Felt Covering.

The suitable insulating materials available are few. Theoretically hair felt is the most efficient insulation in a commercial form, and good work has been done with it. Some of the largest users still specify it and will no doubt continue to do so until there is some competition in the manufacture of a more suitable covering.

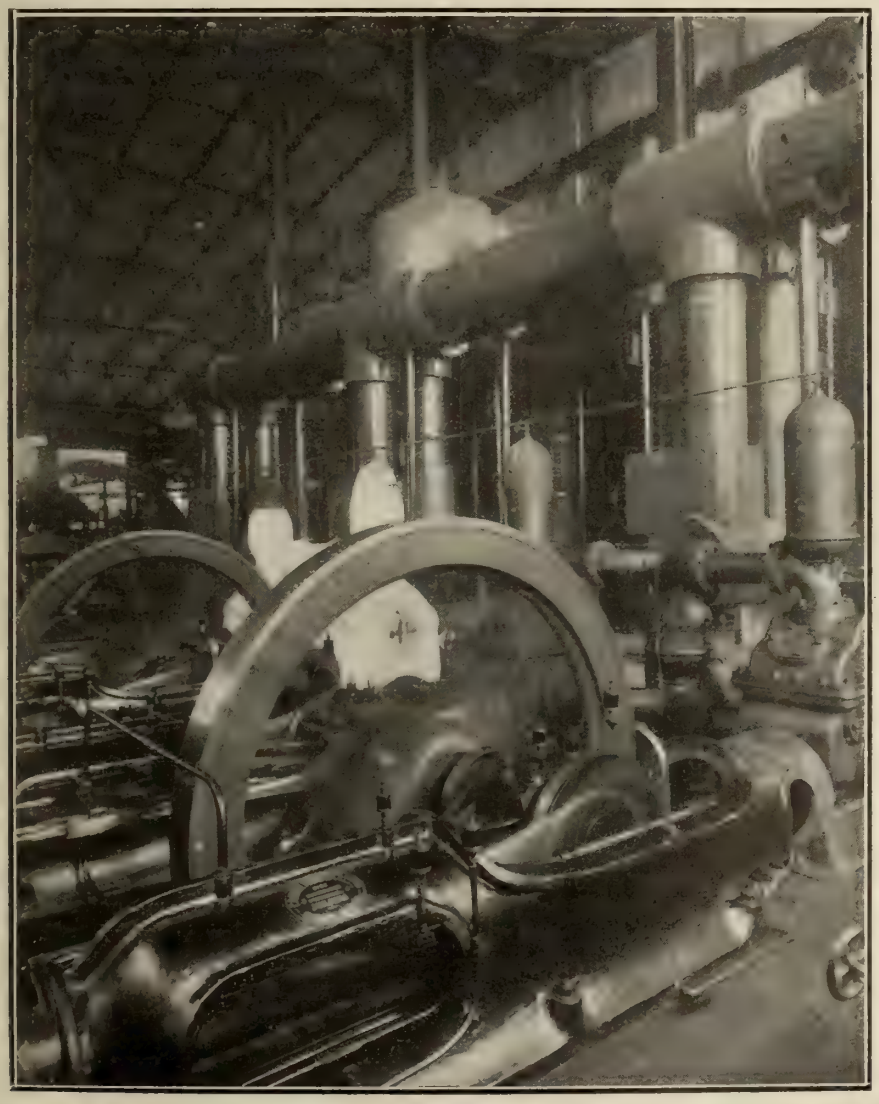

FIG. 4. VIEW IN ENGINE ROOM OF STEEL CO. OF CANADA REFRIGERATING PLANT, HAMILTON, ONT., SHOWING BRINE PUMPS AND THE PIPING INSULATED WITH CORK.

For covering pipes two layers of one-inch air felt are required for temperatures down to 15 deg. F. and below this three layers should be applied. Each layer must be tightly wrapped on the pipe with strong twine, bound spirally one half inch apart. Between each layer of felt two layers of tarred roofing felt should be applied, with joints broken and cemented between the layers with pitch or asphalt. The outside finish should consist of a wrapping of factory cotton bound on spirally and thoroughly coated with asphalt, then a layer of heavy building paper and finally a canvas jacket of 7 oz. duck sewn on. This may be painted with oils to any color desired. The heavy paper makes a uniform surface and prevents the asphalt showing through and disfiguring the jacket.

The fittings are done in the same manner, but not until the straight runs are finished. The covering on the straight runs should stop three inches away from each fitting and hanger and the ends should be sealed up tight with cotton and asphalt before the fittings are commenced. By attending carefully to this latter point the piping may be taken apart if necessary without destroying the covering on the straight runs of pipe.

Cork Covering.

Sectional cork covering as manufactured by the Armstrong Cork Company at Camden, N.J., is an efficient covering, but must be carefully applied so that all joints are perfectly tight. This is best accomplished by applying a liberal quantity of the cement provided and wiring on tightly so that the cement will ooze out of the joint for its entire length, giving particular attention to the end joints. It will sometimes be necessary to periodically paint the wires to prevent rusting. Where skilled help is not available and in difficult positions this covering should be used. It should be approximately three inches thick for ordinary cold storage work and thicker where conditions are severe, as over boilers and passing through warm rooms. Hangers should be made to go round outside the covering and on the larger sizes a protection of sheet iron should be provided on the under side.

The accompanying illustrations show examples of cork covering on large brine piping. The covering on piping over 8 inches in diameter and also on the larger fittings required to be built up to lagging, as will be seen in illustrations.

Cold Water Pipe Coverings.

For ordinary cold water lines the conditions are similar to the brine, but not

nearly so severe. Any good pipe covering firm can supply a sectional covering for cold water lines. The material of which it is made should be impervious to moisture. Asbestos coverings are not satisfactory for this purpose.

Brine Coolers.

Brine coolers of the shell type are difficult to insulate properly. The body of the cooler should have cork laggings held in place by metal bands. The ends should be encased in a tight wood box composed of two layers of matchings with waterproof paper between and filled in with granulated cork. The ends should be made so as to be easily removable for repairs or inspection.

Brine Tanks.

Sheet cork embedded in asphalt and coated with the same material should be laid under the area of the tank. The thickness should be as specified under cold rooms. After the tank is put in position 2 in. by 10 in. scantlings should be erected around the sides, sheeted with two layers of 7/8-inch matchings on outside, with waterproof paper between and the space between the studdings filled with fine granulated cork. If the top has to be insulated the cover should be made in sections of convenient size built up of wood, matched top and bottom, with sheet cork between and having a layer of waterproof paper on both sides of the cork.

The packing around the sides of the tank is an exception to the rule laid down in the article on cold rooms. Sheet cork could be used on the sides, but on account of the difficulty of applying it so as to withstand the expansion and contraction it is only used occasionally in this position.

The continuation of this paper, taking up the steam end, will appear in a future issue.

THE LIGHTING OF WORKSHOPS.

ENGINEERING workshops, which in every other respect may be admirably equipped, are frequently most deficient in artificial illumination. It is by no means an easy matter to decide which is both the most effective and most economical method of lighting, for both requirements and conditions vary to a considerable degree. Although ample light generally does tend to increased output, superior quality of workmanship and freedom from accidents, illumination can be given both in excess and in the wrong places, with the result that waste ensues or the eyes of the workpeople are affected. The subject is one which will well repay a considerable amount of thought on the part of works managers, and it was a happy idea on the part of the president and council of the Manchester Association of Engineers to invite the advocates of the three chief illuminants, gas, electricity and oil, to present papers on the subject of workshop illumination before the members recently.

Features Emphasized.

Although the authors of the papers did not succeed in bringing down their facts to a common basis for comparison, either as regards cost or efficiency, a good deal of helpful information was given, especially regarding the employment of the rival illuminants, gas and electricity, and the general impression left after the discussion was as follows:

1. As regards cost, there is not much to choose between gas and electricity, with the former costing 50 cents per thousand cubic feet and electricity at 2 cents per unit.

2. That oil vapor lamps are quite dependable substitutes where gas and electricity are not obtainable.

READER, WHAT DO YOU KNOW?

Among readers of Canadian Machinery there is a clearly defined sincerity of desire to know how each overcomes the daily tasks of the machine, pattern and blacksmith shops, the foundry and boiler shops. It is believed that your methods and devices, while good, may be improved, and thereby made more valuable if you publish them, so that other brains may work on them. We will provide the setting and pay you for the material. When your fellow tradesman puts the superstructure on your foundation, we pay him and pass the "kink" on to you, free. Get into the game.

3. That for general lighting, gas and electricity are both equally suitable.

4. That electricity lends itself better than gas for local lighting, such as is required with machine tools, etc.

Gas engineers during the last few years have put up a splendid fight with their rivals, the electricians, and they resent seeing, in many engineering shops, gas condemned after such an unfair comparison as is only too often afforded by contrasting the old flat flame burner with the metallic filament electric lamp. With incandescent mantles a cubic foot of gas at a high pressure will give an illumination twenty-five times as great as that obtained from an ordinary flat flame. Even with this advantage, however, for small local lights, such as are required frequently, the metallic filament electric lamp is undoubtedly the most convenient.

Systems of Lighting.

The papers dealing with both gas and electricity demonstrated pretty clearly that a mixed system of general and local lighting is the best method of illuminating machine shops, but before installing either system it is always advisable to investigate the daylight conditions, as these have a material effect on the requirements of the workpeople. For instance, recent tests carried out in a shop showed that the artificial illumination of automatic screw-cutting machines varied between 9 and 15 foot-candles, whereas during the daytime an illumination equivalent to 3 foot-candles was all that was obtainable and satisfied the workers. In another case the daylight illumination was 37 foot-candles and the artificial illumination as much as 133 foot-candles, showing that the workers are frequently given a higher degree of light than is obtained in daylight or than is necessary.

Difficult to Standardize.

One of the great difficulties in fixing a definite standard of artificial illumination is the difference in the Albedo of the materials being worked upon. The Albedo factor of machine shop work is low, especially where iron is being worked, and the degree of illumination is high in consequence. In fact, for very fine and accurate workmanship the illumination theoretically required is many times that necessary for reading or writing. In this connection some instructive figures are obtainable from the United States, where much attention is paid to this subject. In machine shops, for general illumination only—when special lights are provided for the machines and benches—1.5 foot-candles is considered sufficient; for bench illumination, 4 foot-candles; for machines or machine shops with no general system of illumination, 6.7 foot-candles; general illumination of foundries, 3 foot-candles; and power-houses, 2.5 foot candles.

In order to avoid waste of power by the illumination of portions of workshops where there is no necessity for light, local lighting is undoubtedly the most economical, giving each man his own source, say, 50 candle-power, over an area of 10 square feet, which gives an illumination of 5 foot-candles, by placing the lamp at a height of 3 feet above the area to be lighted. As a simple basis for calculating the power required to light a workshop by electricity on the local principle, there was suggested a supply equal to 10 watts per man plus a small amount for general illumination. Efficient opaque reflectors must be used and glare avoided.

The Nature and Manufacture of Shear Steel

By A. P. Hague *

This article describes step by step the various stages in the making of the Shear Steel used for the highest class of edge tools.

TO many the term "Shear Steel" has but a vague and indefinite meaning. The "man in the street" certainly knows that cutlery made from shear steel is of the finest quality and carries a remarkable cutting edge. But beyond this he usually knows nothing of the many intricate processes, both chemical and mechanical, which the iron ore must necessarily be subjected to before it emerges as shear steel. In this article it is proposed to describe briefly the evolution of the shear steel from the iron ore to the finished rolled strip from which the finest razors and general cutlery are made.

Iron Ore.

The ore used is the magnetic iron ore of Sweden, or magnetite. The chemical formula for the pure ore is $Fe_3 O_4$, which contains 72.4 per cent. metallic iron and 27.6 per cent. oxygen. It is, however, never found in a pure state, being usually mixed with varying percentages of alumina, silica, lime magnesia and compounds of sulphur, phosphorous, etc. A typical analysis is as follows:—

Ferric Oxide	= 59.19	per cent.
Ferrous Oxide	= 25.82	"
Manganous Oxide	= .94	"
Alumina	= 1.30	"
Lime	= 1.6	"
Magnesia	= 2.31	"
Silica	= 3.22	"
Carbon Dioxide	= 3.02	"
Phosphorus Pentoxide	= Trace	
Sulphur	= Trace	
Combined Water	= 0.21	per cent.
Organic Matter	= Trace	

The purity of the ore varies greatly, and it may be here stated that only ore of exceptional purity, containing only the merest traces of the compounds of sulphur and phosphorus, can be used when shear steel is to be the final product. The ores of Dannemora and Persberg are remarkably free from these deleterious elements and are thus eminently suitable, whilst those of North Wales and Lapland are contaminated and are consequently worthless for the production of this grade of steel.

Magnetic Separation.

The ore as mined by blasting is mixed with a lot of useless veinstuff. The larger pieces of ore can be picked out from amongst this quite easily, but the smaller pieces can only be obtained by subjecting the crushed mixture to the influence of powerful electro-magnets, which, owing to the natural magnetic properties of the magnetite, readily gather together the fine magnetic ore and leave the useless gangue to be drawn away from time to time.

Calcination.

The ore is next carried to firebrick stoves, or kilns, heated by the waste gases from the blast furnaces, and is there raised to a bright red heat and maintained so for a number of hours. This operation drives off a lot of the sulphur, existing mainly as sulphide of iron, and also renders the ore porous, which facilitates the next operation of

Smelting.

This operation is carried out in the blast furnace, the object being to obtain metallic iron separated from the various oxides with which it has been so far united. In Sweden the blast furnaces, used for the reduction of the iron ore and production of the so-called "Charcoal Pig," are small, very often only carrying a charge of a few tons. The coarsely crushed ore, together with the requisite amounts of charcoal and limestone, used as fuel and flux respectively, are charged in at the top of the furnace. Hot air is blown in through a number of nozzles or tuyeres situated at the base of the furnace and the fuel is soon raised to incandescence, reducing gases are produced and these permeating the ore effect the reduction of the iron from its oxide. The limestone added combines with the earthy matters of the ore or gangue and forms an easily fusible slag.

The metallic iron and slag fall down into the well of the furnace, and there the slag separates and floats on the surface of the iron. When the slag reaches a certain level it flows out through the slag notch, whilst the iron is tapped off from time to time and allowed to flow into the sand pig beds, where it solidifies.

Pig Iron.

We now have a crude iron known as Swedish Charcoal Pig Iron. This may contain 5 to 6 per cent. of impurities and is graded in three classes according as the freshly fractured surface of a pig shows a grey, mottled or white appearance.

Typical analysis would be:—

	Grey %	Mottled %	White %
Combined carbon	0.3	2.0	3.7
Graphite	3.6	2.0	.30
Silicon	.8	.55	.20
Manganese	.3	.30	.30
Sulphur	.02	.02	.02
Phosphorus	.03	.03	.02

As will be seen from the above analysis the impurities the iron still contains are very considerable; so it must be purified still further by puddling.

Puddling.

This process is carried out in Sweden either in the Swedish Lancashire hearth or the Swedish Walloon Furnace. The operation is to surround the pig iron with charcoal and then by means of a blast of air raise the temperature of the ignited fuel, and simultaneously that of the pig iron, until the iron is almost fused. Then by means of long iron bars the iron is literally washed with charcoal and oxide of iron on the hearth. In this manner the relatively large amounts of carbon, silicon and manganese which the pig iron contained are eliminated. The carbon burns, whilst the silicon and manganese unite with oxide of iron and form a slag, which is tapped off.

Shingling and Rolling.

After thus eliminating the impurities the iron, which is now in a pasty condition, is collected into a ball and is hammered or squeezed until quite solid and most of the slag which was incorporated with it has been expelled. The result is a rectangular bloom or billet which is still very hot. It is therefore dragged across the floor and hammered or rolled into a flat rectangular bar, the hammered bar being preferred for the manufacture of shear steel.

Bar Iron.

The flat rectangular bar, having a section about 3½ inch by ⅝-inch and about 12 feet long, known as Swedish Bar Iron and may be a Walloon Bar or a Lancashire Bar, according to the process of purification it has undergone. It is practically pure iron as the following analysis will show:—

Iron	Carbon	Silicon
99.81%	0.05%	0.03%
Manganese	**Sulphur**	**Phosphorous**
0.09%	0.01%	0.01%

In addition to the above impurities there is always a little slag scattered through the bar at irregular intervals.

The vast difference in the chemical composition of the pig iron and the bar iron is at once apparent. The mechanical properties of the two differ also in as striking a manner, for example tests may give:—

Pig Iron.

Maximum stress = 25,000 lbs. per square inch of cross section.
Elongation % on 2 in. = Nil.
Reduction of area % = Nil.

Bar Iron.

Maximum stress = 45,000 lbs. per square inch of cross section
Elongation % on 2 in. = 40 per cent.
Reduction of area % = 74 per cent.

*Associate of Metallurgy, Sheffield University.

The foregoing processes all take place in Sweden. The bar iron is now shipped to Sheffield, where the next stage in the production of shear steel takes place, viz., the conversion of the bar iron into steel in the cementation furnace.

Cementation.

The conversion of bar iron into steel is merely a matter of introducing sufficient carbon into the iron to give a steel of the requisite temper or hardness. The bars, then, are packed into long firestone or iron converting pots, with charcoal completely surrounding each bar. When the pots are full a layer of wheelswarf, two or three inches thick, is placed on the top. The pots are then put in the furnace and gradually raised to a bright yellow heat, say 1,150 deg. C. The increase in temperature is very gradual and during the process the wheelswarf first dries and then fuses, effectively sealing the pots and excluding all air.

The bars are kept at a yellow heat for from five to twelve days, depending on the degree of carburization required. At the end of this period the fires are allowed to die down and the bars to cool. The whole operation may take twenty days. When the bars are cold they are withdrawn and are found to be covered with blisters, hence the name blister bar. These blisters are caused by the action of the carbon, or gaseous carbon, compounds on the enclosed slag of the original bar iron, whereby blisters of steel, as it were, are blown by the gases evolved.

Blister Bar.

Each bar is now taken and one end broken off. From the fracture so obtained the carbon percentage is judged and so a number of grades are obtained, described as No. 2, No. 3, No. 4, etc. The carbon in the different grades is approximately as follows:—

	No. 2	No. 3	No. 4	No. 5	No. 6
	p.c.	p.c.	p.c.	p.c.	p.c.
Carbon =	.5	1.1	1.35	1.6	1.8

Each maker has, however, his own particular number for a certain carbon content.

Blister steel is very coarsely crystaline, brittle and is not homogeneous, the carbon content varying from the outside to the centre of the bar. Consequently the next operation is to produce homogeneity. The blister bar is therefore heated up and the blisters flattened down under a steam hammer. The bars are then known as plated bars. These are cut up into lengths of about 20 inches and six or seven such pieces are piled together, one on the top of the other, and so made into a faggot. This is covered with lime, borax or sand and raised to a melting heat, the whole six or seven plated bars being then welded into a composite bar. This is next rolled down into the section desired and is known as single shear steel.

If double shear steel is required the welded composite bar is marked half way along its length, raised to a welding heat and bent over. The two halves are welded into one bar, so that there is now a bar made up of 12 or 14 separate plated bars. This is then rolled to the desired section and double shear steel of great uniformity is secured, from which the smith makes the particular tool required.

Thus it is seen that shear steel is simply an alloy of iron and carbon in which, thanks to the use of exceptionally pure raw material and fuel, the impurities, silicon, manganese, sulphur and phosphorus, are reduced to a minimum.

A typical analysis of sheer steel suitable for a razor is: carbon 1.6 p.c., silicon .03 p.c., manganese .08 p.c., sulphur .01 p.c., phosphorus, .015 p.c.

A SUGGESTED MOTOR FEATURE.

By D. A. Hampson.

TO whom has the exterior appearance of an electric motor not appealed? The general smoothness of design, the sweeping curves, the generous fillets are ever a delight to the eye. But what of the man who has to set and align one of them with a shaft possibly at some distance from the motor? Symmetry is quickly forgotten, and in its place comes one great wish—a wish for two flat surfaces, not artistic, perhaps, but bearing a known and accurate relation to the motor shaft.

Of course, the base of the motor may be planed off and the yoke or spider carrying the bearings may bolt to the faced ends of the centre frame, which may be accessible at spots if the paint is scraped off, or the motor may slide on planed rails. Again, the pulley might be removed and the oil cover taken off the other end, exposing the shaft so that measurements could be taken from a plumb line dropped somewhere near.

Who wants, however, to dissect even a ½ h.-p. motor to line it up when suitable spots could be so easily provided by the makers? Why could not two pads be added on top of the frame, as far apart as possible, and faced off? Then a good-sized level could be laid across right in plain sight, and the certain error caused by using a level on a stub shaft would be avoided. Further, the hubs at each end could be turned to the same diameter for a distance of ½-inch, and a line dropped to them, or a cut might be taken along the edge of the feet and planing spots on top of them dressed off.

These small improvements would cost little, and would be a real help to millwrights or electricians.

A NEW WAGON LOADER.

THE loading of bulky material, such as coal, coke, limestone, etc., into box cars is often necessary when more suitable equipment is not available, and the simplest method is to lead such material into the cars through a gravity chute. On this principle a new form of box-car loader has been designed by the Fairbanks, Morse Co., of Chicago.

Loader Features.

Apart from the supporting carriage, the loader consists essentially of a bifurcated discharge pipe or chute which leads the material from the lip screens of the loading pockets to two horizontally curved spouts which are projected into the car at will, and may be adjusted to suit practically any condition of flow and delivery. These chutes are lined with bronze to reduce friction, and the material acquires sufficient velocity while traveling down the spout to carry it to the ends. In operation the height of the curved spouts is first adjusted to suit the door of the car to be loaded, and the spouts are extended until their ends are about 25ft. apart and project well into the ends of the car. Loading is then begun, and as the coal, coke, or other material piles up at the ends of the spouts, they are withdrawn so that their ends are kept just clear of the heap. By the time they are completely withdrawn the car is full. The loader travels on its own track from one discharge chute to another as required, and is self-propelled by an electric motor.

Control Mechanism.

The movement of the loading chutes is accomplished by three hand wheels. One serves to raise and lower the chutes to suit the varied heights of the cars; the second controls the movement of the spouts in and out of the car; and by means of the third the spouts are tilted so as to control the velocity of the material, and thus reduce breakage. All the moving parts are carefully counterbalanced, so that but little power is required to adjust them, and the capacity of the loader is practically limited only by the capacity of the lip screens which deliver the material to it. Ordinarily a 40-ton car can be loaded in from 6 minutes to 8 minutes.

Iron and steel attain their maximum strength at temperatures of from 400 deg. to 650 deg. Fah. A test bar of steel showed a tensile strength of 75 tons per sq. in., but when heated to 1,600 deg. Fah. the tensile strength had dropped to about 10 tons per sq. in.

Record Steel Output in the United States During 1912

The figures and data appearing in this article have been abstracted from the Journal of Commerece, New York, and indicate to a remarkable extent, the high degree of successful production output which characterized the iron and steel trade during the past year.

LARGE orders and heavy specifications for finished steel products formed a solid foundation for the steel industry at the beginning of 1912, and the trade entertained high hopes for more substantial monetary returns to be derived from the building of the superstructure during the calendar year.

Expectations were more than realized, and one result was the expenditure of $50,000,000 by the steel companies to increase capacity of furnaces and mills, a marvellous development, when it is recalled that early in 1911, the excess productive capacity was overwhelming and disheartening. To-day, mill rolling schedules are complete for several months; specifications are pressing for the second quarter, and contracts booked are equivalent to the capacity of the mills for nine months, while some manufacturers have taken orders for delivery in the fourth quarter of 1913, and even for shipment into 1914. Never before has the pressure for deliveries been so great or so insistent or so long sustained.

High Capacity Output Percentage.

Early in 1912, the mills were operating 75 per cent. of capacity. This was quickly increased to 80 and 85 per cent., and as soon as possible to 90 to 95 per cent. of rated capacity. At times, it was possible to employ 97 to 100 per cent., but, as was to be expected, it was a practical impossibility to keep full capacity busy indefinitely. Operations at high pressure called for more frequent repairs and increased liability to accidents. At times, inadequate transportation facilities and sporadic strikes prevented the ready assembling of raw material or obstructed the distribution of finished products. The strong preference shown for open hearth steel by consumers was also a handicap upon the operating departments.

Obstacles, however, only increased the energy displayed by the working forces, and resulted in establishing new high records of production in all departments. The gain in steel output over 1910—the year of previous greatest production—was 15 per cent., while the increase in ingot output over 1911 was 26 per cent. Slightly smaller gains were made in iron as distinguished from steel, as the foundry iron consumers were slower to feel the urge from the wave of greater prosperity.

Congestion of Unfilled Contracts.

With each succeeding month new business rolled into the mills far in excess of the capacity to produce—culminating in October—which means, of course, congestion of unfilled contracts. The recovery in market values, which began during the last quarter of 1911, continued throughout the year 1912, ranging from $4 to $10 per ton, or a rise of $5 to $13 per ton from the lowest points in 1911, without taking into account the premium of $4 to $6 per ton obtained for preferred shipment on special products. The largest interests have thrown the weight of their influence against higher prices, but a further appreciation in some lines seems probable before the upward movement has spent its force.

Railroad Material.

The railroad companies were a factor in the year's developments, especially during the last six months, when urgent necessity for rolling stock and motive power forced many small roads, as well as the great trunk lines, to place heavy orders for all kinds of equipment. In the last quarter of the year more cars were ordered than during the first six months, and many contracts are still pending. The car shops and locomotive builders booked more orders in 1912 than in any year since 1905 and 1906, which were the years of maximum buying.

It was the rail mills, however, that felt the greatest force of the railroad contracts. Rail orders were never so great, being a little less than 5,000,000 tons, nearly half of which tonnage is for 1913 shipment. Orders for about 1,500,000 tons were carried over from 1911, indicating that the rollings in 1912 were approximately 3,900,000 tons.

Orders From Other Sources.

Too much stress must not be laid upon the railroad support of the steel mills in 1912, however. Orders from other sources than those dependent upon railroad patronage were more important, and called for a greater aggregate tonnage. The total volume of business was so heavy that the railroads—directly and indirectly—contributed only 33 per cent. to the orders placed—that is, a normal proportion after four lean years.

Total Contracts Placed.

It is estimated that total contracts were placed for 26,500,000 tons of finished steel products during the year, about 8,500,000 tons being derived from the railroads and railroad equipment manufacturers. The total orders booked for finished products by all the steel companies thus exceeded the production of such products by 4,000,000 tons, and it is estimated that new orders exceeded shipments by 5,000,000 tons, while there is a back log of 14, 000,000 tons more awaiting rolling and shipment in 1913 and 1914.

In the steel structural trade—including bridges and building—the railroads failed to maintain the 1911 proportion of total contracts in a record-breaking business done by the fabricating shops. The total tonnage booked was 1,510,000, to which the railroads contributed 384,337 tons for bridges and terminals, or 25½ per cent. The 1912 contracts exceeded the 1911 orders by 15 per cent., and were also slightly in excess of the 1906 bookings, thus establishing a new high record. The American Bridge Company secured about 46 per cent. of the total tonnage.

Export Trade.

The export trade made even a more phenomenal expansion than domestic business, reflecting the unprecedented activity in iron and steel products in international markets. It is estimated that the United States shipped close to 2,800,000 tons of steel products in 1912, and booked orders for 3,000,000 tons on foreign account. The profit upon this business was never so great as in the third and fourth quarters; prices were as satisfactory, if not more so, than in the home trade. For the time being, tariff revision has small terrors for the industry.

World's Production of Pig Iron.

The world's production of pig iron in 1912 was close to 75,000,000 tons, of which the United States produced about 40 per cent., although its blast furnace capacity is approximately 42,000,000 tons annually. Furnaces with an annual capacity of 35,500,000 tons were active in the latter part of the year, producing iron at the rate of 32,600,000 tons per year. Stacks with 2,000,000 tons capacity will probably blow in during the next few months, leaving a reserve capacity of approximately 5,000,000 tons per year. The steel companies produced a little under 22,500,000 tons, and the merchant furnaces about 7,230,000 tons in 1912. Merchant blast furnace interests sold about 7,435,000 tons during the year, or a little in excess of the output. Taking into account the increase in the export, and the decrease in the import movements, together with a net decrease of 800,000 tons in surplus stocks, it is

indicated that the total consumption of pig iron in the United States in 1912 was in excess of 30,300,000 tons, or a gain of nearly 24 per cent. over the apparent melting in 1911.

*Estimate.

A LARGE MINE HOIST.

AN order for what is believed to be the largest mine hoist in the world was recently placed with the Nordberg Manufacturing Co., Milwaukee, Wis., for the mine of the Inverness Railway and Coal Co., Inverness, Cape Breton Island, N.S. It is of the Nordberg-Corliss duplex double-drum type. The cylinders are 34in. by 72in., and each of two drums can be operated independently of the other. The load which the hoist is designed to lift is a train of 12 cars, each weighing 1,150lb., and containing 2,240lb. of coal. This load must be pulled up a 10,000ft. incline, which varies in slope from 16deg. at the surface to 35deg. at the bottom. The stress produced in the hoisting rope by this load is approximately 41,000lb., and this, together with the length of the cable, is the feature which makes the hoist probably the largest ever constructed.

LARGE BATTERIES.

A PAPER by Mr. F. H. Whysall on "The Use of a Large Lighting Battery in Connection with Central Station Supply," was read recently before the Institution of Electrical Engineers. It referred mainly to the results obtained during two years' working of the 12,000 ampere-hour battery installed in March, 1910, at the Manchester Corporation Electricity Works, which at that time was the largest battery ever constructed. The paper also showed to what extent the predictions regarding the use of the battery have been fulfilled and the relief obtained in the cost per unit supplied.

Composition of Battery.

The author said that the battery consisted of 210 cells, each cell containing 38 positive plates and 39 negative plates of the following dimensions:—Positive plates, 20¾in. wide by 29in. deep by 0.4in. thick; negative plates, 20¾in. wide by 29in. deep by 0.31in. thick. The positive plates were of the Plante formation, cast in one piece, but the negative plates were of the improved box type composed of half-grids securely riveted together, the spaces between them being filled with active material. Specially impregnated wooden separators were employed between adjacent plates, and a free space of 8in. was left at the bottom of the cell for the accumulation of deposit.

Duty of the Battery.

The chief duty of the battery was to take 3,000 kw. off the lighting peak. It was also regarded as a standby. Its chief duty, however, was load-levelling; it was, therefore, decided to have three hand-regulated reversible boosters, and to run them in parallel at times of maximum discharge. At other times one or two would be used as required. It might be noted, however, that such importance was attached to the question of overload in emergency that it was the universal custom on the Continent to use regulating cells in all central station batteries.

The improvement in load factor on the units generated, observed monthly over two years, was approximately 7½ per cent., and the value obtained from the chart on 30½ million units representing a saving of $50,830. There were, therefore, two distinct annual savings on running charges due to the battery: (1) Standby boiler fuel costs; (2) difference between steam generation at 8 per cent. load factor and bare fuel cost.

The Canadian Bond Hanger & Coupling Co., Ltd., Alexandria, Ont., have had a test made on one of their "Spiro" compression couplings at the Drexel Institute, Philadelphia. The "Spiro" stood a load of 11,400 pound inches without slipping on its shaft. When tightened, it withstood a load of 20,000 pound inches, without the hubs being hammered. Descriptions of their power transmitting machinery are given in Catalogue 25.

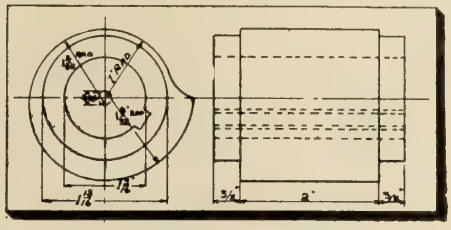
AN INTERESTING RELIEVING ATTACHMENT.

By J. Davies.

ON one occasion we had to make a large hob for hobbing a worm wheel, and, as we had not an up-to-date tool room lathe fitted with a relieving attachment, the foreman devised the scheme here illustrated and applied it to an engine lathe. The latter had its leading screw at the back and its friction feed shaft at the front, as seen. The feed shaft was fitted with a cam (1) which gave the necessary reciprocating motion to the tool in combination with the coil spring (9) at the back of the slide rest. The feed shaft was, of course, geared to the lathe spindle in such a way that it made the same number of revolutions per revolution of the lathe spindle, as there were flutes in the hob.

Referring to the sketch (1) is the cam, which was made of machinery steel case-hardened, and fitted with a key to slide along the splined feed shaft. As may be seen, the cam is of a form to give a gradual forward feed to the tool, with a quick return, the latter being brought about by the release of the coil spring (9), which is compressed during the forward movement. This spring also keeps a constant pressure on the cam through the lever (4) and connecting pieces (2) and (6). It can be adjusted to any tension by nuts at each end of the rod passing through its centre and through the slide rest. Part of the circumference of the cam is concentric, in order to cause the tool to pause momentarily and ensure its not running into the cutting edge. Its dimensions are seen in Fig. 2. Bolted to the lower edge of the apron is a cast-iron bracket (3), bored to suit the rod (2), for which it serves as a guide. The rod (2) has a foot forged on one end to make contact with the cam. This foot is case-hardened. The lever (4) is fulcrumed in a forged jaw (5), which is bolted to the underside of the saddle.



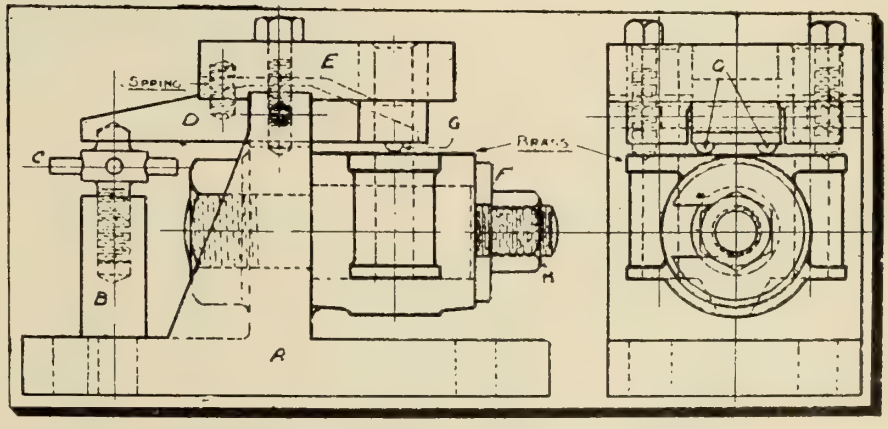


FIG. 2. CAM FOR RELIEVING ATTACHMENT.

The tool was fed in at every cut by the top slide of the compound rest; and for running back the saddle to its original starting place for a fresh cut the lathe was stopped with the tool opposite one of the flutes, and the saddle run back without withdrawing the tool from the work. This secured more positive regulation of the amount of the cut.

To relieve the taper portion of the hob the tool rest was swung round to the proper angle and the tool fed in by hand. The tool used was 1½ x ¾ inches, ground at the point to 29 degrees to suit the worm. The insides of two threads were thus relieved simultaneously.

DRILLING JIG FOR CONNECTING ROD BRASSES.

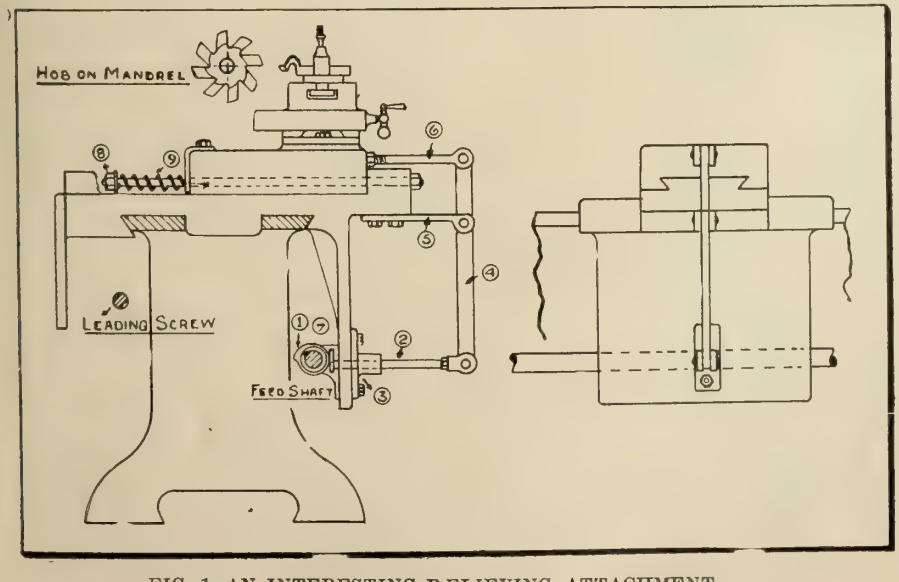

FIG. 1. AN INTERESTING RELIEVING ATTACHMENT.

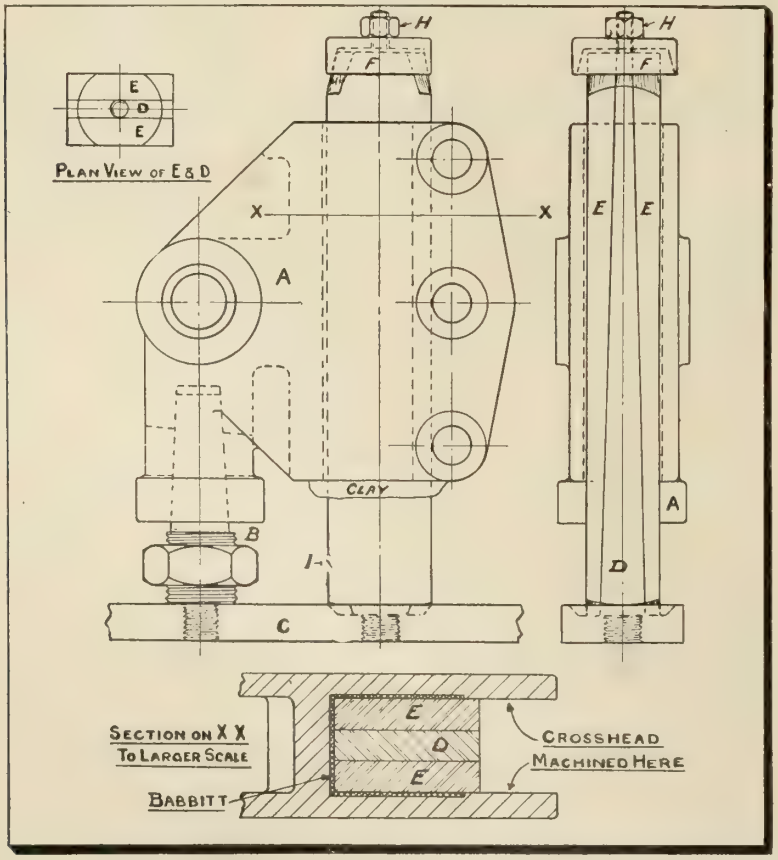
DRILLING JIG FOR CONNECTING ROD BRASSES.

By D. O. Barrett.

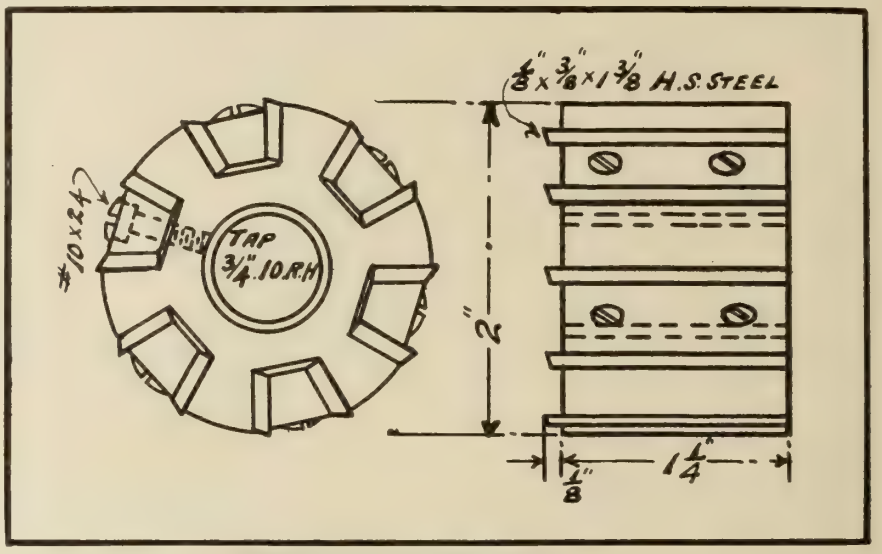
THE drawing shows a jig for drilling the brasses for the connecting rod of a gas engine. The two halves of the brasses are cast together, and after boring and milling, are drilled on this jig and are afterwards split. The back face of the brass being first milled, the hole is then bored and the ends faced. The brasses are held on a steel stud by means of a nut and slotted washer, in such a way as to be readily removable, the outside diameter of the nut (H) being smaller than that of the main body of the stud. The top piece (E) carries the two bushings. The steel piece (D) carries two round head casehardened rivets (G) at the one end, which bear against the finished face of the brass, and bring it square with the drill bushings. The piece (D) is normally held down by means of a spring, but may be pushed up by means of a

capstan screw (C), after which the nut on the steel stud (H) may be tightened for holding the brass. This jig is very quick and effective.



JIG FOR BABBITTING LOCOMOTIVE VALVE STEM CROSSHEADS.

By A. E. Till.



THE device here shown was first used in the West Toronto shops of the Canadian Pacific Railway and has since been sanctioned by the general Master Mechanic for the use of the entire system. It should be mentioned that many engines on the above-mentioned road have their valve stems guided by a crosshead running on a short guide bar. The jig here shown was designed by the writer for babbitting these valve stem crossheads and has greatly reduced the cost of the operation.

Referring to the sketch, (A) shows the crosshead in place on the jig. The taper hole for the valve stem is placed upon the taper plug (B), which is located at the correct distance from the face (I), which corresponds with the lower side of the guide bar. The plug (B) is screwed permanently into the base plate (C) and so is the centre wedge (D), both of them being in line. The plate (C) is cupped out to receive the lower coned edges of the wedge plates (D) and (E). These wedges are also coned at the top and are there held together by a cast iron cap (F) and the nut (H). After melting out the babbitt, the crosshead is retinned and is then put in position over plug (B) and centre wedge (D). The cupped recess in the base plate (C) is then blown free of all dirt, etc., and the side wedges (E) are inserted. The crosshead is then knocked down securely upon the plug (B) and the wedges are tightened down by the cap (F) and nut (H). Clay is then applied at the bottom as shown and the babbitt poured.

To remove the work from the jig, the cap (F) is taken off and the nut on plug (B) is screwed up against the crosshead, forcing it off the taper plug. The side wedges will rise with it and are afterwards knocked free. When cool the crosshead is ready to be applied to the engine without any machining or scraping.

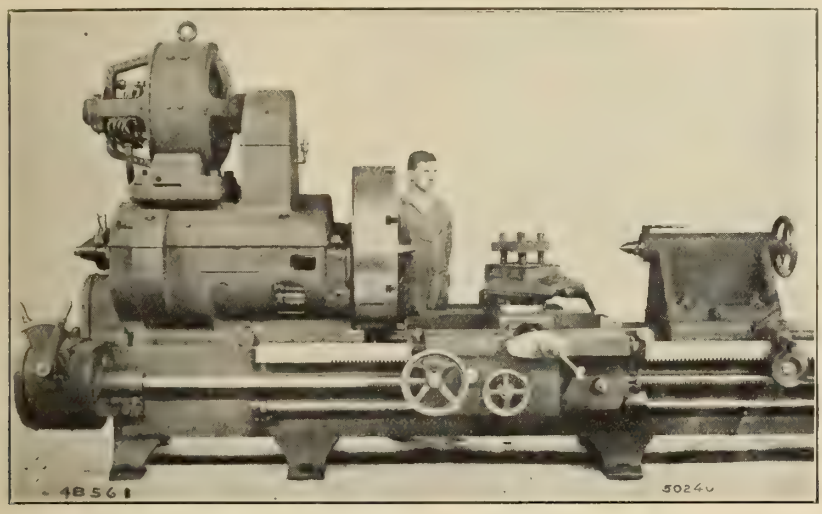
JIG FOR BABBITTING LOCOMOTIVE VALVE STEM CROSSHEADS.

INSERTED BLADE END MILLS.

INSERTED BLADE END MILLS.

By D. A. Hampson.

WE had eight or ten duplex millers running on cast iron parts. Both carbon and high speed steel cutters were used. All were solid cutters and we kept a stock of about one hundred of them. They ranged in size from 1½ to 3½ inches diameter, with plain and threaded holes from ½ to 1 inch diameter. The large amount invested in them, the semi-annual re-cutting of the worn specimens, and the increased labor in grinding them when again worn, made it imperative to standardize these cutters, as they had been made or selected from catalogues more or less hurriedly on account of the rapid expansion of business. Of course, an inserted blade cutter was selected. We made the bodies of machinery steel and cut them so that two high-speed steel blades were held in place by one clamping piece. A typical cutter (end mill) is shown in the drawing. Incidentally the number of teeth in a cutter was reduced twenty to thirty per cent., with a marked saving in the cost of sharpening. Gauges were made by means of which the blades could be extended evenly when worn.



The results were gratifying in every respect. While the first cost averaged about the same as new solid cutters, the renewal cost was greatly decreased, with no re-cutting expense and little worn down tool steel to throw away. As to finish of the work, this was in every case equal or superior to that obtained with end mills having a larger number of teeth.

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

LATHE FOR TURNING PROJECTILES.

THE motor-driven lathe here illustrated is for turning projectiles. This service requires rigidity of equipment and wide speed range; a very high spindle speed being necessary when finishing the point of the projectiles. The lathe, which is of Pond make, is especially designed for individual motor drive, and is not a belt drive machine modified for motor drive. The motor is placed on the lathe head, thus saving floor space and doing away with any chance of injury to employees from their coming in contact with the motor or gears; at the same time the motor is protected from harm. The control handle, it will be noticed, is to the extreme right of the tool apron and very convenient for the operator.

LATHE FOR TURNING PROJECTILES.

The lathe is driven by a Westinghouse 20 h.p. machine-tool motor, 400-1,500 r.p.m. Commutating poles insure excellent commutation at all loads within its capacity, and with the liberal speed adjustment of the motor in combination with the gear changing device operated by means of the levers shown at the left end of the tool, the wide adjustments needed in turning up projectiles are made readily available.

A MODERN FORGING HAMMER.

THE tendency in modern shop practice, especially in the iron, steel and allied industries, is toward centralization of the power plant and the reduction of the steam piping system to a minimum. Most new, and many of the older shops avail themselves of the electric current as a medium for the transmission of power, and several of the principal steel plants of the world even drive the largest rolling mills direct by electric motors. But until recently, the heavy forge shops were still dependent on steam for their operation, as the power hammers available were suitable for relatively light work only.

The Nazel Engineering & Machine Works, Philadelphia, Pa., is now supplying a hammer known as the Beche Air Hammer, which has already found favor among some of the leading locomotive builders, steel works, implement and machinery manufacturers and technical schools. This hammer has a number of interesting features, among which is that, being self-contained and providing its own compressed air supply, it can be installed wherever belt or electric power is available. The hammer embodies over 30 years' experience in the building of steam and compressed air hammers and various types of pneumatic power hammers, and was originally introduced with the idea merely of meeting cases in which a sufficient supply of steam was not available to operate a steam hammer. It is said to have proved so satisfactory, however, that it is now in many instances even replacing steam hammers. The general design of the Beche hammer is illustrated in Fig. 1, which shows one of the smallest of these hammers. In con-

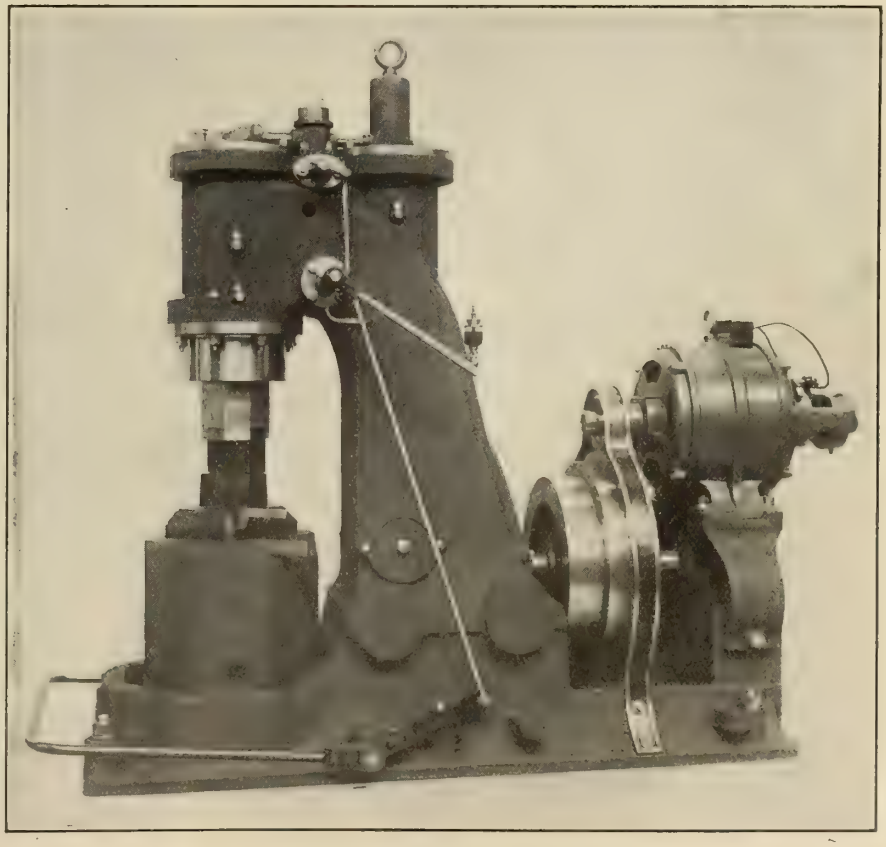


FIG. 1. BECHE MOTOR DRIVEN AIR HAMMER.

struction the machine is very simple. The hammer frame is in one piece, which is fastened to the bed plate; the anvil block being separate. The working parts consist of two cylinders, in one of which a piston operates, actuated by a connecting rod attached to the motor-driven crank shaft. In the other, the ram or hammer head, slides vertically on closely fitted guides, and operates by vacuum and compressed air produced by the double acting piston in the first cylinder.

Another novel feature of this hammer is the construction of the ram or hammer head, shown in Fig. 2. This is in no way attached to any other part of the hammer. It is a hollow one piece forging, bored from the solid stock, and designed for long wear and severe service. The ram cylinder head has a central extension which enters the hollow ram, thus forming an air cushion against which the ascending ram reacts. The hammer is equipped with two air valves, which not only simplify operation, but place the hammer under positive control at all times. When the valves are closed the ram is held suspended, allowing space for the placing or manipulating of the work. When the valves are opened by means of the treadle or hand lever, the hammer goes into operation. The force of the blow depends on whether the valves are opened suddenly or gently, and is increased from the lighter stroke as the valves continue to be opened. The treadle and hand lever are operated independently.

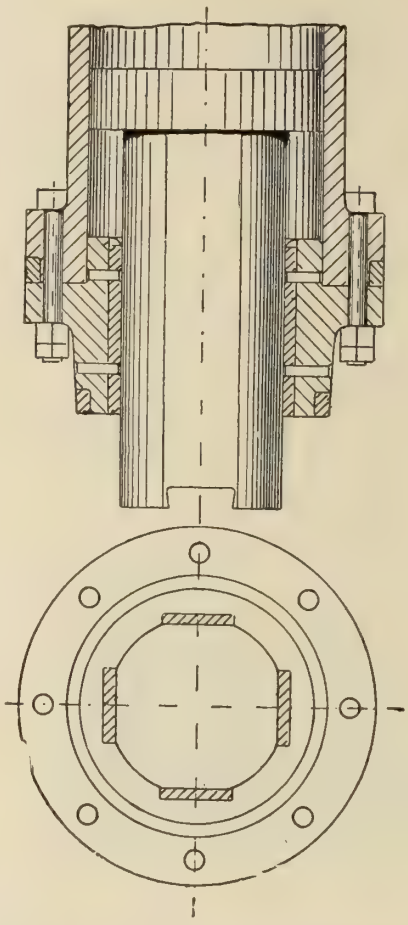

FIG. 2. RAM AND GUIDE, BECHE AIR HAMMER.

The Beche hammer is built in six sizes with ram weights ranging from 66 to 770 pounds. As pointed out above, the energy for one blow is generated by two strokes of a double acting piston; the force of the blow, therefore, is very great. The 770 pound hammer will, it is claimed, forge to advantage stock up to 9-inch rounds. Another feature of this new hammer is its economy in power consumption. When geared direct to an electric motor the whole installation becomes very compact, but the hammer can be very easily altered to electric drive, as all the principal parts are the same for either type.

SIX-INCH CAM CUTTING MACHINE

FIG. 1 represents the 6-inch cam cutting machine with fixture for cutting face cams; the former being mounted on the outer end of arbor (A), while the blank to be cut is mounted on the opposite end of the same arbor. This arbor is driven by worm and worm gear from the universal joint, power feed shaft, shown to the front of the machine. The arm containing the work arbor pivots on the forward end at (B), and is guided at the rear end by guides,

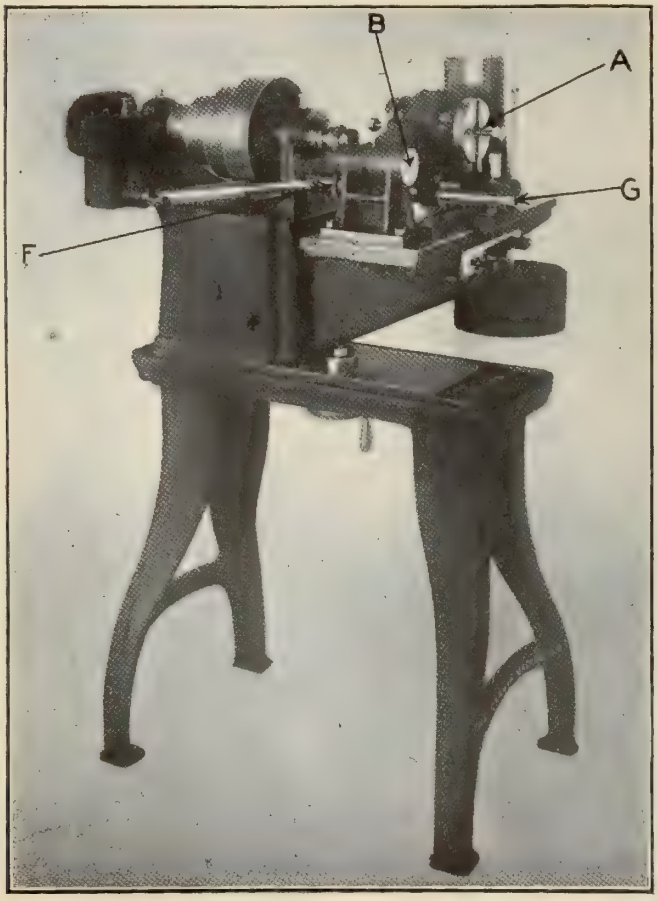

FIG. 1. 6-INCH CAM CUTTING MACHINE.

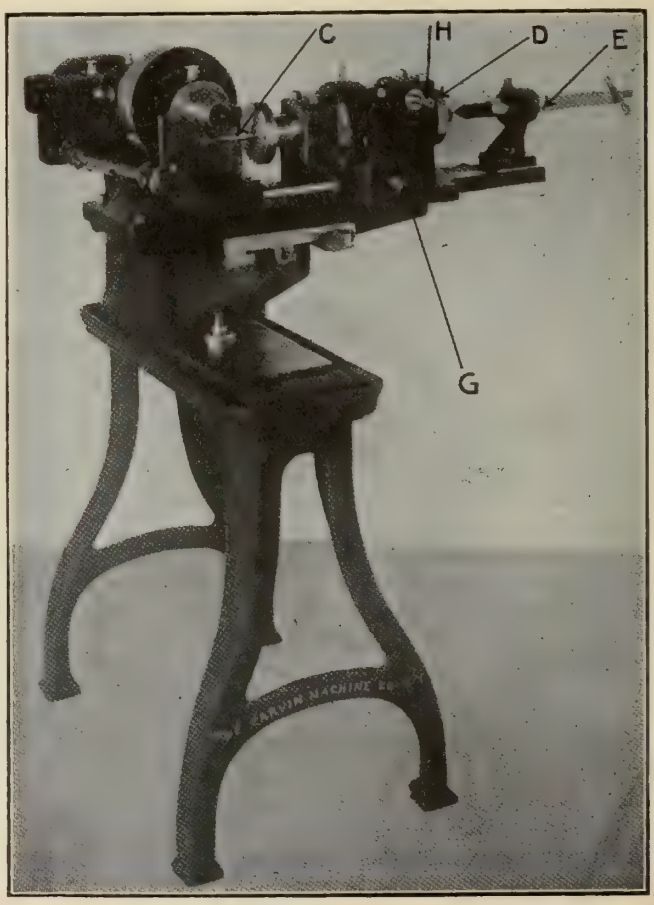

FIG. 2. 6-INCH CAM CUTTING MACHINE.

the whole being mounted on the same table. The arm has, in addition to its own height, that of detachable weights to keep the former on to the roller, offsetting the stress of cutter.

In changing from this face cam fixture, the entire slide is drawn off from the top of the knee and shelved in its completeness; the power feed, universal joint shaft readily detaching for this purpose. The barrel fixture is shown in fig. 2. The feed rotating the work on arbor (C) has the former mounted on the rear end of same at point (D), the former being kept against the rail by the adjustable spring tension rod (E). The feed in both attachments is disconnected by clutch (F), giving a hand control by wrench points (G). In this barrel fixture at times, there are quick returns, which require a quick let up of tension contact of former and roll. This is provided for by the use of a crank on pinion shaft (H), which in effect eases off the spring pressure and helps over this hard spot. The spindle of the machine takes No. 7 B. & S. shank cutters, and all gearing is housed and free from damage to itself or the operator.

The weight of the machine complete is 850 lbs.; it occupies a floor space of 36 inches by 43 inches, and is furnished by the makers, The Garvin Machine Company, Spring and Varick Streets, New York City, with either or both of the attachments mentioned above.

COMBINATION DISC GRINDER AND DRUM SANDER FOR WOOD PATTERNMAKING.

THE illustration shows the motor-driven patternmakers' disc grinder manufactured by Charles H. Besly & Co., Chicago, all gear guards being removed to show the construction. The disc wheel is of steel, 30in. diameter x ¾in. thick, and runs at 750 r.p.m. The work table serving the disc wheel is 14 inches wide by 40 inches long. It may be tilted and locked at any angle from 75 degrees to 135 degrees from the plane of the grinding disc, large distinct graduations being provided to govern this angular adjustment. The construction is such that the inside of the working edge of the table remains within 1-32 inches of the disc, regardless of the angular adjustment, and the supporting mechanism is at the back of the disc wheel and below the face of the work table, so that the top of table is always clear of obstructions from one end to the other. The work table has a vertical adjustment of 25 inches, and being supported by a round vertical shaft, it may be swung away from the grinding disc for convenience in resetting wheel or facing off extra large patterns.

The machine is equipped with four work table attachments, which are very valuable on wood pattern work, as follows:

FIG. 2. DRUM ATTACHMENT, BESLY PATTERNMAKERS' GRINDER.

(1) Sizing circle gauge, for cylindrical and conical grinding.

(2) Sliding bevel gauge, for simple and compound angle grinding.

(3) Sizing bevel gauge, for simple and compound angle grinding to dimensions.

(4) Angle plate for free-hand cornering of thin work.

The machine carries a telescoping dust hood, which may be piped to an exhauster for withdrawing the grinding dust. The drum sanding attachment at the right has a work table 24 inches x 28 inches. It may be tilted and locked at any angle from 85 degrees to 105 degrees from the axis of sand drum. The sand drum shown is 2½ inches diameter by 8 inches long, but drums from 1 inch to 6 inches diameter of any reasonable length may be used.

The work table has a central round opening, 8½ inches diameter, into which are fitted circular plates, with centre holes to accommodate various sizes of drums. The sand drum runs at 2,250 r.p.m., and has a perpendicular reciprocating movement while running to equalize the wear on the abrasive. This movement is actuated by a crank and link, as shown, and is adjustable from 0 to 4 inches. The drive is a 3 h.-p. motor through sprockets and link belt maximum silent chain. The drum sanding attachment is driven through a Johnson self-oiling friction clutch, as shown, which enables the operator to stop the drum sander regardless of the disc wheel. This is very essential, as a disc wheel is usually allowed to run continuously, while the drum sander must be stopped in order to change to various sizes of drums for different work. The sand drum spindle is driven by a 2-inch quarter turn belt, and the reciprocating crank is driven through gearing by a 1½-inch belt.

Figure 2 shows the sand drum attachment finishing straight and curved inside surfaces with the tables tilted 1½ degrees for draft. The machine occupies a floor space of 54 inches x 84 inches, and weighs 2,800 pounds. It is made with 30-inch or 40-inch diameter disc wheels, belted or motor-driven.

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

THE VALUE OF SKELETON PATTERNS.

By J. H. Eastham.

CO-OPERATION between pattern shop and foundry foremen, if practised oftener in the matter of laying out new work, would result in many cases in a saving in the former department, and

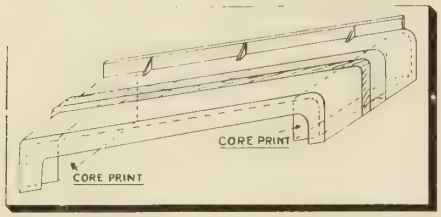

Fig. 1. The Value of Skeleton Patterns.

nearly always cut down foundry expense. Often, a costly, well-finished, complete pattern comes down to the foundry, and has to be hacked out of all recognition before coming into practical use. The case of the turbine side wall patterns, shown in perspective in Fig. 1, will make this clear to the average jobbing foundryman.

This pattern, measuring approximately 10 feet long by 4 feet wide, by 2 feet deep at the ends, with a flange under one side 10 inches deep, was, owing to pressure of business, made and delivered to the foundry in excellent condition by an outside firm of patternmakers. It was checked over and found correct in every detail. Obviously, the best way to handle a pattern of the above dimensions, both with a view to economising space on the foundry floor and reducing

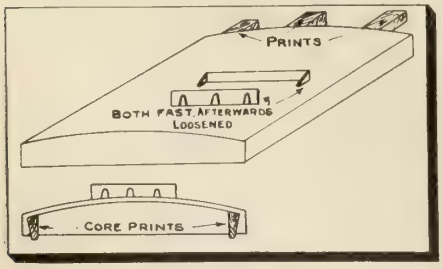

Fig. 3. The Value of Skeleton Patterns.

the cost of rigging, was to "bed in" the job. This method was adopted, a cinder bed being first laid at a convenient depth under the entire area of the casting.

The pattern was next lowered into the hole, levelled by parallel straight edges, and iron bearings rammed under the massive end coreprints, these to remain in position through the order of twelve castings required. A glance at the plan view of the pattern in Fig. 2, which shows the heavy cross ribs and square facings on the under side heavily outlined in black, will demonstrate the futility of attempting to get what moulders call a "good bed in" from a complete pattern. Hence, spaces were sawn in the body, marked (cut) in the

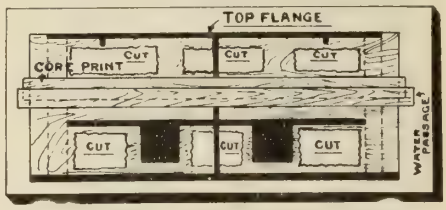

Fig. 2. The value of Skeleton Patterns.

sketch; the ramming, ironing, and venting of the various corners, and face of the mould being thus made very simple, instead of almost impossible, with the pattern as at first provided.

A Furnace Door.

The rail furnace door pattern (Fig. 3), was sent to the foundry by a customer requiring 24 castings. The brackets shown on the top side were nailed and glued fast to the body, the whole pattern was beautifully finished from, say, a cabinet maker's point of view but as a paying line in the foundry it was decidedly below par. Per-

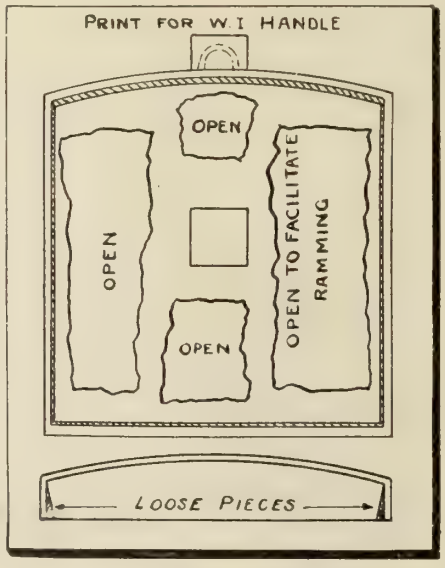

Fig. 4. The Value of Skeleton Patterns.

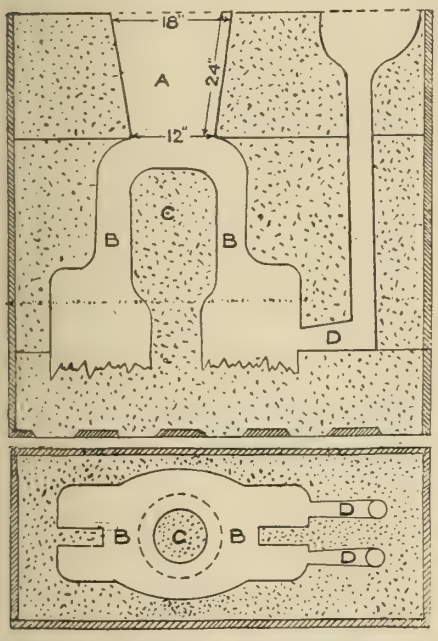
mission was obtained by the foundry foreman from the customer's inspector to loosen the brackets, and to have them fitted with dowel pins, but he was not allowed to slot the pattern. Still the job was simplified a little anyhow. However, as the pattern was about 4 feet square, the flanges 7 inches deep, and the job bedded into a permanent drag part to save the moulder howling for the over-worked crane every few minutes, considerable inconvenience was felt in tucking under the flanges as compared with the pattern of similar design shown at Fig. 4. This latter pattern was of skeleton design, some two-thirds of the face being left open. Strips were bedded to the inside of the flanges and drawn sideways after the removal of the pattern from the sand, the saving in coremaking and cost of moulding in this case amounting to about 25 per cent., compared with the handling of the piece shown in Fig. 3.

While, admittedly, wooden skeleton patterns, unless heavily battened, are not nearly so strong or rigid as those of solid design, less pounding down of the pattern on soft sand is needed when bedding in, as the interior of the job is more easily accessible to rammer and vent wire. The chances of swells and scabs, owing to unduly soft or hard places, are also reduced to a minimum.

HYDRAULIC RAM CASTING.

By William Fines.

THE production of thoroughly sound castings of various kinds is one of the problems that the foundryman is called upon to solve; prominent among the number may be classed those for hydraulic purposes.



For making sound hydraulic castings, it is essential that the mold be specially adapted so as to reduce blowholes and sponginess to a minimum, and that a suitable iron mixture be used. In order to cope with the first difficulty, the castings are invariably made in dry sand; or to be more explicit, the mold is made in the usual way and then placed in a stove to dry before use. This procedure allows of the metal being received in a hotter state than if it were a green sand mold and also helps it to maintain uniformity of composition throughout, as it is not chilled on entering the mold, neither is there fear of blowholes in the casting, due to the presence of moisture.

Feeding the Casting.

The next item that claims attention is that of feeding the casting, for no cast-

ing containing any great body of metal can be made solid. A casting solidifies on the outside, leaving the centre hollow or porous. To overcome this trouble, feeding rods are used, a riser or header being placed on the thick part of the casting and the rods worked in and out; molten metal being added from time to time to fill the void caused by shrinkage. This is the usual method adopted in dealing with most castings, but in the case of those for hydraulic work, engineers have a strong objection to the feeding rod method, and insist on the casting being fed with a large header. The effect of the header is that the casting is self-fed by pressure due to weight of metal in the header.

The section and plan is shown of a mold for a hydraulic casting of about 1,350 lbs., and illustrates the method of feeding with a larger header. (A) is the header, (B) the mold, (C) the core,

SECTION AND PLAN OF MOLD FOR HYDRAULIC CASTING.

and (D) the runner or gate. It will be observed that the casting is run from the lowest part of the mold, this being the usual procedure to obtain a clean casting. After the metal is run, it is necessary to cover that in the header with dry blacking or charcoal to insure its remaining in a fluid state until it has served the purpose of feeding the casting. Referring back to the header box, it is advisable to dry it with the mold and not make it in green sand, which is sometimes done, as this tends to chill the metal, causing it to solidify before the casting has been properly fed.

It will be found that a header less than 12 inches for a fairly large casting is useless. The cost of cutting a header off a casting is expensive, but any attempt to economise by having a narrow neck joining the header to the casting results in the solidification of the iron in the neck. This renders useless the fluid metal in header for feeding purposes. A good mixture for hydraulic castings is: Two-thirds No. 3 brand of pig iron and one-third heavy scrap with low silicon content. This will give a close grain iron, fairly easy to machine. From "The Practical Engineer," London, Eng.

1913 FOUNDRYMEN'S CONVENTION AND EXHIBITION.

CHICAGO has been selected as the Foundrymen's Convention and Exhibition city for this year. In order to allow the greatest scope for the latter purpose, and in view of the numerous bookings of international and other exhibitions in that city this coming fall, it has been necessary to select the week of October 13. The dates selected are October 14, 15 and 16, and the Hotel La Salle has been retained as the association headquarters, the business sessions being held there also. Further announcement of the convention details will be sent out in due course.

The result of the ballot for the changes in the constitution gave 104 votes in favor of the changes recommended by the convention, and one vote in favor of every change except that relating to associate membership. Under the constitution the vote has carried.

CANADA FOUNDRIES & FORGINGS, LTD.

THE annual general meeting of the shareholders of the Canada Foundries & Forgings, Ltd., was held at the company's head office, Brockville, recently. A very favorable report for 1912 was presented. The net earnings were sufficient to provide for the preferred stock dividend and bond interest, and after making provision for bad and doubtful debts, renewals and repairs to plant, depreciation charges and 20 per cent. of organization expenses, a balance of $25,680.33 was carried forward to the credit of profit and loss.

During the year the sum of $63,813.85 was expended on additions to buildings and machinery, which will increase materially the producing capacity of the different plants. The demand for the various products of the company has been well maintained, the sales showing a substantial increase over those of 1911, while for the present year there is every indication of further expansion.

The recent fire at the Canada Forge Co. plant was referred to in the directors' report as not involving any loss to the company. Advantage has been taken of the destruction of the old building to replace it by a modern steel structure of considerably larger area. Pending the completion of the new building, operations are being carried on under a temporary structure. The directors elected for the current year are as follows: E. C. Billings, Hartford, Conn.; Robert Bowie, Brockville, Ont.; John H. A. Briggs, Brockville, Ont.; Geo. P. Brophy, Ottawa, Ont.; Wm. Henry Comstock, Brockville, Ont.; John T. Dillon, Titusville, Pa.; Thomas J. Dillon, Welland, Ont.; J. Gill Gardner, Brockville, Ont.; John M. Gill, Brockville, Ont.; Hon. Geo. P. Graham, Brockville, Ont.; J. H. Housser, Toronto, Ont.; W. M. Weir, Montreal.

Mr. John M. Gill was elected president; J. H. Houser, vice-president, and H. A. Briggs, secretary-treasurer.

WILL FIGHT LEAD POISONING.

THE American Association for Labor Legislation calls attention to a warning which has been sent out by the New York State Department of Labor against lead poisoning as it exists among painters and lead workers in factories. They state that recent Federal investigation showed that this disease of plumbism is from eight to ten times as frequent in America as in European factories.

The association has a uniform bill for the regulation of the industry, which is to be introduced in the Legislature of every State of the Union. The association is conducting a campaign of education among the workers themselves, telling them that lead enters the body mainly through the nose and mouth. It may also be inhaled through the skin. As preventive measures the men are instructed always to wash before eating; never to eat in the workroom; never to chew tobacco or gum while working, because of the danger of lead mixing with the saliva; not to wear working clothes on the street or at home because of the danger to others; to use respirators; to keep the workroom clean; to eat a good breakfast before going to work, and to drink plenty of milk. The use of intoxicants in any form is proscribed. The final injunction urges the workmen to keep clean.

The Canada Carton Co., Ltd.—Incorporated at Ottawa with $40,000 capital, to manufacture paper, paper boxes, pails, bags, cartons, etc., at London, Ont. Incorporators: Alexander Le Breton Woonton, Edouard Gordon de Wolf, Claude Brown, Edgar Hudson, Michael Patrick McDonagh, all of London, Ont.

GROUP LIFE INSURANCE FOR EMPLOYEES.

A LARGE firm of stove manufacturers in the United States has interested itself in the "welfare of its employees" to the extent of procuring "group life insurance" for each and all of them. Needless to say, this action has been appreciated, and the general effect, of itself, gives promise of results which will be far reaching in cementing a relationship of consideration for each other's views and status. Welfare work has, up to the present been somewhat limited in its scope of application and operation, being almost entirely confined to effort on the part of large corporations. That this should be so is regrettable, for it is as operative in small as in large concerns, and what has been found to give increased returns and satisfaction in the latter, is as easy of attainment in the former. Reverting to this particular departure in "Welfare Work," viz., "Group Life Insurance of Employees," it should be noted that this particular insurance in no way influences the claim of the employees in case of death by accident, and does not interfere with any workman's liability law, since it is a death and not an accident insurance.

It occurs to us that some such arrangement would be appreciated by the employees in our Canadian factories, large and small, and that, in any case, the idea is worthy the consideration of those who rule and direct our many industrial enterprises.

OUR ADVERTISING SECTION.

MANUFACTURERS fully realize to-day the necessity and demand for advertising their product, and are backing it up by much sincerity of statement. In this they are ably supported by reputable trade journals. Advertising in these mediums is not now a catch-penny question. The page of any such paper is like a well dressed window in a departmental store, giving point to every special feature and appealing to the purse like bargain day.

We are convinced that clean advertising, concentrated as regards mediums used and extended in quantity, carries the palm as the pioneer in beating the path out from your factory door, and is the eliminator of hardship and inconvenience to the consumer. Effective and systematic advertising is more than half the battle in securing your market, and followed up by direct personal assurance from and by you or your representative in your prospective customer's sanctum instead of your own, there cannot possibly be failure in securing business.

Every doctrine of political economy and philosophy warrants us in stating that present methods do conspire to results, and that a much distorted conception of how the beings of this old world are constituted, is responsible for the theory that if a manufacturer has goods that are a necessity to the people, the latter will beat a path to the factory door to be supplied.

Consumers, generally, busy themselves with a host of questions more or less unbeneficial to their best interests, and as a consequence, lose sight of the advantages to be derived from a careful study of the advertising section of the medium which pertains directly to their requirements.

The manufacturer must make beaten paths radiate from his centre of operation to all points of the world's surface and circumference that his product is designed to reach. By display, mail, representation (local or itinerant), and advertising, must he "ancient mariner like" arrest and deliver his message to those he reckons as being needful to his service. Sitting at his desk will not avail unless he is unceasingly regulating and disseminating realistic information of what he manufactures and sells. All manner of ingenuity must be displayed, as all manner of being has to be approached. What appeals to one by sight may be unseen by another, for it is a matter of common knowledge that such blindness is widespread.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

FOUNDRY AND MACHINE SHOP.

Maple Creek, Sask.—The Anderson and Lee Machine Co. have opened up here in the implement business.

Port Robinson, Ont.—The Standard Steel Construction Co. will erect a 60 x 300 ft. steel plant, to cost approximately $100,000.

Ottawa, Ont.—Fire recently did damage amounting to $4,000 at the Ottawa Pattern and Foundry Co.'s plant, on Ottawa St.

Medicine Hat, Alta.—The city engineer has recommended the appointment of a civic blacksmith. The city has a blacksmith's shop.

Moncton, N.B.—The machine shop of J. O'Brams and Sons was wrecked on February 11 by an explosion of gas. The loss exceeds $7,000.

New Liskeard, Ont.—New machine shops will be opened by the Wabi Iron Works inside of three months. They will manufacture machinery required in the mining region.

Tofield, Alta.—The Tofield Foundry and Machine Co. expect to have their new plant equipped by the spring. Machinery is arriving from the east and being rapidly installed.

St. John, N.B.—The insurance carried by the McLean, Holt Foundry and the H. G. Edgecombe Carriage factory which were burned on Friday, February 7, was $2,700 and $4,500, respectively.

Toronto, Ont.—The Canadian Car and Foundry Co. have orders on their books in excess of $15,000,000. They recently received a large order from the C.N.R. which will keep the plant busy until September.

Belleville, Ont.—The Tivani Electric Steel Co require the following machinery for plant now in course of construction: electric motor, 2,000 volts, 2 meters, large rock crusher, 2 small compressors, crucibles and drills.

Parry Sound, Ont.—The foundation for the new smelter is completed and ready for the superstructure. A quantity of steel is on the ground. The contractors for the new docks are making excellent progress.

Cobalt, Ont.—Machinery has been ordered for the mill on the Swastika mine, and will be in operation inside of a month. The mill is designed to receive 10 stamps, but only five will be installed now, and the others when needed.

Walkerville, Ont.—George Reid will erect a garage and factory, costing $19,000. It will be of brick, stone, concrete and steel construction, three stories 119 x 50 ft. Leybourne & Whitney, Davis Bldg., Walkerville, are the architects.

St. John, N.B.—Mr. G. Burton Stewart, managing director of the Norton Griffiths Co., Ltd., says that if the province will assist them, they will install a shipbuilding plant in St. John, in addition to their repair plant at Courtenay Bay. He spoke also of the firm establishing a steel works.

Toronto, Ont.—The owner of the Bowman Gas Range Co. plant, which was destroyed by fire on February 10, will rebuild. The damage was $9,000. In the same fire, the plant of the Railway Equipment Co. was destroyed. This was owned by the Canadian Malleable Steel Range Co., of Oshawa. Their loss was $16,000.

St. Thomas, Ont.—The industrial Committee with Ald. Martin as chairman are considering the offer of the steel concern to locate here. The company wants a loan and a fixed assessment, and agree to erect a $100,000 plant, employing 150 men. They will manufacture all kinds of steel, and will take contracts for bridges and buildings.

Hamilton, Ont.—A foundry to cost $250,000 is planned for the Hamilton Malleable Iron Co., Ltd. The main building will be 600 x 200 feet and will contain 15-ton melting furnaces, annealing furnaces, complete cleaning and finishing equipment, and high-speed electric travelling cranes. Other buildings include a machine shop, carpenter and pattern shops, storehouse, pattern storage vault and office. Cranes, compressed air molding machines and sand blast equipment are included in the requirements. J. E. Hammond is manager.

Sydney, N.S.—The Dominion Steel Corporation has made arrangements for an active business in nails in the north west. The company has bought large water front properties at Fort William, with the idea of erecting a nail mill there similar to the new mill at the Company's plant in this city. Two 'tween deck steamers have been assigned to the service to make bi-monthly trips to the head of the lakes to carry nails, wire and other finished products. The steamers may bring grain down, or may carry ore for special mixtures.

Electrical

Caledonia, Ont.—This town has hydro-Electric power now, and is looking for new industries.

Toronto, Ont.—The Ontario Hydro-electric Commission will supply Scarboro' Township with power for $2 a month plus $30 per h.p. per year.

Peterborough, Ont.—The contract between the Hydro-electric Commission and the city will be signed this week, after which the work will proceed.

Guelph, Ont.—The Elora Council have applied to the Hydro-electric Power Commission to furnish estimate of cost for power from Guelph to Elora.

St. John, N.B.—The New Brunswick Hydro-electric Co. will make a large expenditure in connection with its project to provide another source of light, heat and power.

Calgary, Alta.—City power has been transmitted to the north-eastern section of Calgary, and will be used by the Golden West Brewery Co., the Winnipeg Oil Co., and the public abattoir.

Winnipeg, Man.—The city is planning an extension of its electrical terminal station on River Street, which will take care of the new line to Point du Bois. The station will be doubled, and will cost $10,000.

Woodbridge, Ont.—The Woodbridge and Vaughan Independent Telephone Company were reported to be negotiating with the Bell Telephone Company for the sale of the concern. The sum asked is $60,000.

Thorold, Ont.—The citzens are strongly in favor of Hydro power, and and will ask that the Ontario Hydro-electric Commission consider the establishment of a municipally-owned plant here. It is understood that Allanburg and Fonthill would become customers.

Ottawa, Ont.—Transformers, meters and general electrical supplies are required by the city council. Tenders will be called in about two weeks. Legislation will be asked to allow city to issue debentures for $150,000 for changing present electric plant from two-phase to three-phase.

Motor Car Industry

Vancouver, B.C.—The Beaver Automobile Co., Portland, Ore., which was recently incorporated with a capital of $150,000, contemplates the erection of a plant here for the manufacture of automobiles.

Moose Jaw, Sask.—The Canadian Standard Automobile and Traction Co., Ltd., will begin delivering motors in less than a month. The firm will make a six-cylinder car with nickle trimmings and aluminum running board. The heating plant will be installed in a few weeks.

General Industrial

Montreal, Que.—An ink factory for the Carter's Ink Co. is being planned.

Sarnia, Ont.—A gate factory to cost $8,000 for the Regal Gate Co. will be built.

Oil Springs, Ont.—One flax mill here has been started up again with a full force of men.

Montreal, Que.—The extension to factory, to cost $8,000, for Liquid Air Co., will be made.

Winnipeg, Man.—The T. Eaton Co., Ltd., will build a three-storey addition to their present factory .

Berlin, Ont.—A clock factory on Frederick Street is contemplated by the Arthur Pequenet Clock Co.

Montreal, Que.—A fire did $50,000 damage to the factory of the Canadian Ribbon Co. on February 13.

St. Thomas, Ont.—Thomas Bros., Mfg. Co. will build a factory costing $30,000 to manufacture brushes, brooms, etc.

Montmorency, Que.—An extension to the factory for Dom. Textile Co., is planned, to contain 1,200 new looms.

Saskatoon, Sask.—A tile factory is planned for the S. & S. Non-breakable Hollow Building Tile Co. for next spring.

Belleville, Ont.—The Gilmour Door Co. have sold land to the Canadian Creosoting Co., who will probably erect a $200,000 plant.

Calgary, Alta.—The plant of P. Burns Company, meat packers, will be rebuilt outside of Calgary, in a new section to be called 'Burns.'

Galt, Ont.—S. L. Clark will erect a creamery in the spring. The building will be of brick or concrete construction, with concrete and tile floors.

Trenton, Ont.—The Canadian Pearl Button Co. have been re-organized with an enlarged capital. The firm will now be able to extend its plant.

St. Henri, Que.—A factory will be built for the Alaska Feather & Down Co., 412 St. Ambroise Street, two storeys high, and of brick construction.

Trenton, Ont.—The Canadian Creosoting Co. have been granted concessions by the council, and will build a $250,000 plant here, employing 100 men.

Tavistock, Ont.—Senator Valentine Ratz plans the erection of a felt boot factory. The building will be of white brick, two storeys, 60x75 ft., and is estimated to cost $15,000.

Halifax, N.B—The plant of the North Atlantic Fisheries Co. at Port Hawkesbury was completely destroyed by fire on February 12. The insurance on the plant amounts to $212,000.

Medicine Hat, Alta.—The mill and elevator of the Redcliff Milling and Elevator Co., at Redcliffe, Alta., were destroyed by fire on Saturday, February 8. The loss, including wheat, is $50,000.

Hamilton, Ont.—The Eagle Mills, Ltd., a company recently incorporated at Ottawa, will probably erect a knitting mill this year. Another company is also planning a knitting mill. Penmans of Paris are interested.

New Westminster, B.C.—The B.C. Transport Co. will erect a large brick plant. The kilns will be equipped with an oil burning and heating plant, and the machinery operated by water power. Mr. T. H. Pearson is the manager.

Montreal, Que.—The Smart-Woods Co. plan alterations and additions to their bag factory on Mullins Street. It will be three storeys, of reinforced concrete, brick and mill construction. Ross & McDonald, 1 Belmont Street, are the architects.

Prince Rupert, B.C.—The Northern Brick and Tile Co., Ltd., is the name of a company that has recently been inporated for the manufacture of brick for the Prince Rupert market. The company is made up entirely of local men.

Hamilton, Ont.—The Board of Control have not yet agreed to the amalgamation of the Hamilton Gas Light Company and the Ontario Pipe Line Co. Only on this condition will the United Gas and Coke Company establish their plant here.

Burlington, Ont.—The Vera Chemical Co. will erect a size factory of four storeys, 152 x 62 ft. Boilers, engines, belting, 70-ft. stacks, will be required. Gladman & Gladman, Confederation Life Bldg., Toronto, Canada, are the architects. D. C. Davis is superintendent of the company.

Stratford, Ont.—Ratepayers on March 10 will vote on two by-laws, to make concessions to the Farquaharson-Gifford Co. if they erect a $30,000 factory for upholstered furniture, and to treat the R. F. Kastner Company similarly for the manufacture of leather mills, gloves and fur coats.

Peterborough, Ont.—Part of the De Laval Dairy Supply Co.'s. plant is complete. The power house has one 125 h.p. boiler, and another will be added when the rest of the factory is completed. Plans call for other buildings of six and seven units, each unit being 112x100 feet. Mr. Ralph Stoddart is the president.

London, Ont. — The company which bought the Wilcox plant in Chelsea Green will be known as the Richards-Wilcox Mfg. Co. Mr. Wm. R. Yendall is the general manager. A start will be made on the manufacture of door-hangers and overhead carrying systems this month. Immediate extensions are to be made.

Montreal, Que.—Mr. R. J. Tooke, head of the well-known shirt and collar firm, has decided to retire, and arrangements have been made whereby the Semi-Ready, Ltd., will acquire the factory, stores and other premises of R. J. Tooke, Ltd., with a capital stock of $300,000. It is the intention of the new owners to extend the operation of the Tooke Company throughout Canada.

Municipal

Chatham, Ont.—The City Council plan t instal a hydro-electric system. Mayor A. J. Dunn.

Montreal, Que.—The Board of Commissioners require 8,130 tons of cast iron water pipes.

Tilbury, Ont.—The Town Council will install a hydro-electric system. The clerk is W. A. Hunter.

Regina, Sask.—This city will spend $15,000 on a plant to make gas from coal for domestic purposes.

Transcona, Man.—The owners of 50 acres of land will offer it to bona-fide manufacturers at a nominal figure.

Kerrobert, Sask.—The Town Council plan to purchase fire fighting apparatus this year. The clerk is O. H. Anderson.

Teeswater, Ont.—Power machinery is required by the County Council for the development of power on the Saugeen River.

St. John N.B.—The public works now under way in this city and the immediate vicinity involve an expenditure of $45,000,000.

Transcona, Man.—The Fire, Health and License Committee will advertise for a double cylinder chemical engine for Ward 4.

Medicine Hat, Alta.—The ambulance arrangement is so unsatisfactory here, the city is considering the purchase of a motor ambulance.

Nanimo, B.C.—The ratepayers will shortly be asked to vote on a by-law whereby $25,000 will be raised for purchase of auto propelled fire apparatus.

Kingsville, Ont.—A by-law will be submitted March 3 whereby $10,000 will be raised as a loan to the Dominion Stove Company for the erection of a factory here.

Guelph, Ont.—The city have fixed taxation of the Page-Hersey Co. at $15,000 for the next ten years. Work will commence at once on the firm's new $40,000 plant.

Bassano, Alta.—The town will submit a by-law to the people on February 21 authorizing them to borrow $8,000, for the construction of plank sidewalks, and the erection of a town hall.

Portage La Prairie, Man.—A by-law will shortly be submitted to the ratepayers whereby the sum of $35,000 will be raised to cover cost of building bridges at High Bluff and Westbourne.

Yorkton, Sask.—The burgesses will vote on a by-law to raise $75,000 for the purpose of extending the present electric system, and to raise $18,000 to cover cost of improving present waterworks system.

Springbank, Ont.—The city of London plans changing old pump house to power house; three large electric generators will be operated by power from River Thames, to work in conjunction with hydro-electric power.

Railways--Bridges

Hamilton, Ont.—The Hamilton Street Railway Co. are planning a five mile extension in the east end.

London, Ont.—The London Street Railway plan double tracking in several parts of the city.

Chatham, Ont.—Three bridges are planned by the City Council, of steel and cement construction.

Toronto, Ont.—C.N.O. Railway Co. have been authorized to construct four bridges.

Estevan, Sask.—The G.T.P. will build a branch line into Estevan from the line now being built from Regina to North Gate.

Vancouver.—It is proposed to expend $2,250,000 on good roads in the neighborhood. The provincial government will be asked for assistance.

Winnipeg, Man.—The Lake Winnipeg and Nelson River Railway Co. will apply for charter for railroad from upper end of Lake Winnipeg.

Kingston, Ont.—Kingston sent a delegation to urge upon the G.T.R. the advisability of running its line farther into the city than at present.

Toronto, Ont.—The Strachan Ave. bridges over the G.T.R. and the Queen's wharf spur on the C.P.R. are to be reconstructed four feet higher.

Brandon, Man.—The Brandon Street Railway System will be extended as far as the Dominion Experimental farms. The clerk is H. W. Brown.

Lethbridge, Alta.—The C.P.R. line to be built by the Alberta Railway and Irrigation Co. will probably pass through Pincher Creek and Cardston, Alta.

Ottawa, Ont.—The Superior Rolling Stock Co., Ltd., has made a conditional sale of a large amount of rolling stock to the Algoma Central & Hudson Bay Railway Co.

St. Boniface, Man.—Tenders will be received up to Monday, February 17, for the substructure of the Provencher Bridge, across the Red River, J. B. Cite is city clerk.

Toronto, Ont.—The Scarboro Township Council have asked the Railway Commission to order the C.P.R. to erect a bridge over their lines between Scarboro and Pickering Townships.

London, Ont.—It is said that $400,000 worth of bonds, or a controlling interest in the Chatham, Wallaceburg and Lake Erie Railway have been acquired by the Mackenzie-Mann interests.

Fredericton, N.B.—When opening the legislature last week, the Lieut-Governor announced that work on the St. John Valley Railway and the Fredericton Grand Lake Railway was being pushed forward.

Hamilton, Ont.—The T. H. & B. Railway will probably elevate their tracks to improve Hunter Street at a cost of $760,570. To depress them, it is estimated that the cost would be over $3,000,000.

Toronto, Ont.—The new Gerrard St. bridge, costing $200,000, will be 66 ft. wide. The type will be deck plate girder approach spans. Plans have recently been approved by the civic works committee.

Stratford, Ont.—A by-law will be submitted to the people on March 10 granting the C.P.R. right of way along the south shore, for its Embro to Linwood line. If the by-laws passes, the Dufton Woollen Mills will be removed.

Parry Sound, Ont.—The Canadian Northern Railway Co. has been authorized to extend spurs to the Canada Chemical Co.'s smelter, and to the iron and ore bins and charcoal plant of the Standard Iron & Lumber Co. of Canada, Ltd.

Ottawa, Ont.—Two years more has been given for the completion of the lines of the Niagara, St. Catharines and Toronto Railway. The lines authorized are from Port Colborne to Fort Erie and Niagara Falls and thence through Welland, St. Catharines and Hamilton to Toronto.

Vancouver, B.C.—In connection with the installation of oil burning locomotives to run between Vancouver and North Bend, the C.P.R. will erect oil tanks at Port Moody, Coquitlam, Mission Junction, Ruby Creek and North Bend. The oil will be brought to Port Moody and Vancouver by ocean vessels, and will be pumped from Port Moody to Coquitlam.

Montreal, Que.—The new roundhouse which is being constructed for the G.T.R. by the John S. Metcalfe Co., at St. Lambert, Que., is rapidly approaching completion, and will furnish accommodation for housing and repairing 27 locomotives of the largest type. The structure comprises roundhouse, machine shop, boiler house, fan house, office and stores and casting store.

Wood-Working

Elmira, Ont.—The Elmira Furniture Company are preparing to build a large addition to their factory.

Minaki, Ont.—A saw mill is planned for next fall for The Crossing Lumber Co. Managing director Frank R. Patriarche.

Sidney, B.C.—A new engine and dynamo arrived last week for the Canadian Southern Lumber Co., to be used in their large mill.

Hamilton, Ont.—On February 13, a fire destroyed much machinery and lumber in a planing mill, owned by J. J. Smith & Sons.

Montreal, Que.—Fire did $3,000 damage to the saw mill of William Rutherford & Sons, Limited, on February 10, at 425 Atwater Avenue.

Guelph, Ont.—The Robert Stewart Company, who operate planing mills and kindred works at Guelph, Ont., are expected to erect a new factory in the near future.

White Rock, B.C.—A sash and door factory and lumber mill is to be erected here in time for this season's building operations. Work will commence on it this month.

Edmonton, Alta.—The Upper Frazer River Lumber Co., of Montreal, has started work on a large saw mill at Bar Creek, which will employ over 200 men in the mill and 400 cutting timber. A. H. Edwards, Alberta Hotel, represents the company here.

Fredericton, N.B.—Galvanized iron roofing, metal lath, electric light and fire equipment, planing mill machinery, extensive piping connections, belting and sprinkler system will be required for the rebuilding of the Fraser lumber mills.

Building Notes

Welland, Ont.—The Methodist Church will build a Sunday School to cost $10,000.

Amherst, N.S.—This city is to have a $50,000 armory on condition that a site is given free.

Toronto, Ont.—The Township of Scarboro' will borrow $18,000 for the erection of two schools.

St. Catharines, Ont.—Warren Bros. have been granted a permit for a $10,000 addition to their factory.

Moose Jaw, Sask.—A $250,000 permit is in now for the proposed Maitland Hotel, plans for which are ready.

Dunmore, Alta.—A Seattle firm will erect a $50,000 hotel here. Building material has been ordered in Medicine Hat.

Ingersoll, Ont.—Nagle & Mills have been awarded the contract to build a convent here of red brick, faced with stone.

Vancouver, B.C.—The contract for the Y.M.C.A. has been let to Booker, Campbell & Whipple, Ltd., at a cost of $340,270.

St. John, N.B.—Work on the new C.P.R. elevator is progressing. The forms for the concrete foundations are being set up.

Regina, Sask.—A six-storey warehouse, 120x120 feet, to cost $215,000, is planned for the John Deere Plow Co., Regina, Sask.

Victoria, B.C.—Weiler Bros., house furnishers, will erect a half million dollar ten-storey structure as soon as the plans are completed.

Toronto, Ont.—The Board of Education will build a $280,000 High School of Commerce and Finance. It will contain an assembly hall for 1,000 persons.

Walkerton, Ont.—The contract for building a pier for Southampton bridge has been given to the Hunter Bridge and Boiler Co., at $10,000, their tender being the lowest.

Revelstoke, B.C.—Tenders are being asked for the construction of the Oddfellow's block at an estimated cost of $18,500. It will be two storeys high with a basement.

London, Ont.—It is reported that English's, Ltd., real estate agents, Toronto, have asked for an option on the Spencer block at $90,000, and that a million dollar hotel will be erected.

Montreal, Que.—Messrs. Ross and McDonald, architects, are busy preparing plans for a $1,000,000 hotel to be built on the site of St. George's Church, Dominion Square. These provide for 600 rooms. The church have two years in which to vacate the premises.

Victoria, B. C.—Tenders are asked by the provincial government for the construction of the new normal school, at an approximate cost of $250,000. The frame will be of reinforced concrete. There will be a woodworking room and a forge in connection with the school.

Vancouver, B.C.—The contract for building the Hudson's Bay Co. store has been let to Messrs. Rourke, McDonald & Monerieff, a local firm. It will be 10 storeys high, with two basement floors. The construction will be of steel and reinforced concrete. The mechanical plant has been designed by Mr. Percival R. Ross, of New York. The building will have its own heating, lighting and refrigerating plants. It should be ready for occupancy by Christmas.

Toronto, Ont.—The new technical school will cost $1,325,205 for building, $250,000 for site, and with extras will total $2,000,000. The accepted tenders were: Noreross Bros., building, $1,082,700; General Fire Extinguisher Co., heating and ventilation, $148,900; Fred. Armstrong Co., plumbing, $42,600; Turnbull Elevator Co., elevators $6,005; Estimate for wiring $45,000. The building will be of Credit Valley stone, with Indiana red stone trimmings. It will take two years to erect.

Refrigeration

Regina, Sask.—Hugh Armour & Co. are having their branch meat house at Regina equipped with a 25-ton "York" refrigerating plant.

Toronto, Ont.—T. Eaton Co., Ltd., are adding to the refrigerating plant in their department store a 4-ton "York" refrigerating machine.

Toronto, Ont.—The Toronto General Hospital is being equipped with a 17-ton "York" refrigerating plant and small ice making system. Installation is by the Kent Co., Ltd., Montreal.

Toronto, Ont.—Indications are that it will be at least a year before Toronto gets the new civic abattoir in operation. There has been considerable delay in preparation of plans, and there is little money available for the work.

Charlotteown, P.E.I.—The Island Cold Storage Co., Ltd., has had its refrigerating plant improved by addition of a 30-ton horizontal double acting "York" refrigerating machine, installed by the Kent Co., Ltd., Montreal.

Ottawa, Ont.—The Ottawa Artificial Ice Co. have let contracts to the Triumph Ice Machine Co., Cincinnati, O., for machinery and apparatus for a 50-ton ice making system and for an additional 10-ton refrigerating system for bottling works. The plant is to be electrically driven and equipped with multiple-effect evaporators for supplying distilled water.

Marine

Coquitlam, B.C.—The C.P.R. will probably establish elevators on the Pitt and Frazer Rivers here.

Port Colborne, Ont.—The government elevator here will have its capacity increased from 750,000 to 2,000,000 bushels.

Le Pas, Man.—The Dominion Government Department of Public Works will spend $50,000 in dredging the Pas River and building suitable docks, etc.

Revelstoke, B.C.—The Dominion Government is building a new wharf on the Columbia River, 260 feet long and 36 feet wide. The estimated cost is $10,000.

Collingwood, Ont.—At the annual meeting of the Farrar Transportation Co. it was practically determined that a new 12,000 ton steamer should be built.

Vancouver, B.C.—A halibut schooner was launched last week for the Canadian Fish and Cold Storage Co., at the Vancouver Shipyards. The company will increase its fleet from five to ten shortly.

Sault Ste. Marie, Ont.—The towns of Southampton, Port Elgin and Kincardine, have asked the Federal Government to subsidize a regular steamship service between Southampton and Sault Ste. Marie; also for an appropriation for a breakwater and dredging at Southampton. The government has promised sympathetic consideration.

Personal

C. R. Ross, who was formerly electrical engineer of the Winnipeg Street Railway, is in charge of the development of Dunmore, Alta.

James G. Lindsay, engineer and waterworks manager for the city of Belleville, Ont., since April, 1910, has resigned. He will relinquish his duties February 24.

George Ross, P.L.S., has been appointed Welland county engineer, at a salary of $8 per day while engaged, and James McKeown, of Willoughby, superintendent of highways, at a salary of $1,100 per annum.

Tenders

Sutherland, Sask.—Tenders are asked up to February 24 for 8,650 ft. of 12-inch steel pipe; 9,775 ft. of 10-inch; 4,000 ft. 8-in., and 18,800 ft. of 6-in. steel or cast iron pipe for waterworks and sewer systems.

Hamilton, Ont.—Tenders are called for 12-inch high pressure flanged pipe; 12-inch bell and spigot pipe, high pressure; 12-inch, 16-inch and 24-inch special castings for high and low pressure service. Address tenders to Mayor Allen.

Newcastle, N.B.—Tenders are asked for a concrete and steel bridge 2,727 feet long, four truss spans, and a swing draw. Some of the piers are to be built in 41 feet of water and 24 feet of mud. The estimated cost is $300,000.

Toronto, Ont.—Tenders will be received by registered post only ,addressed to the Chairman of the Board of Control, up to noon on Tuesday, March 4, 1913, for 24-inch and 30-inch, 36-inch (a), 36-inch (b), and 42-inch cast iron pipes.

Toronto, Ont. — The Hydro-electric Power Commission is calling for tenders for galvanized steel towers, copper and aluminum cable, insulators, galvanized malleable iron and galvanized pressed steel clamps, for the construction of 125 miles of transmission line to operate at 110,000 volts.

Sarnia, Ont.—Tenders will be received up to March 15 for waterworks construction. These include:—Furnishing cast-iron or steel water pipes and special castings; gate valves, flexible joints, expansion joints, etc.; furnishing and erecting pumping machinery and accessories; furnishing and erecting boilers.

Vancouver, B.C.—Tenders are invited for: 5,280 lin. ft. of 2-in. gal. iron pipe with unions; 5,280 lin. ft. of 4-in. No. 8 lapwelded or weldless steel pipe; 107,000 lin. ft. of 6-in. No. 9 lapwelded or weldless steel pipe; 50,000 lin. ft. of 8-in. No. 7 lapwelded or weldless steel pipe. These should reach City Purchasing Agent, City Hall, before March 5.

Toronto, Ont.—The Controllers have decided to give the preference to the John Inglis Co., Toronto, in awarding the contract for water tube boilers for the main pumping station. Works Commissioner Harris had recommended the tender of the Babcock & Wilcox Company, a Scotch-made boiler. The Inglis tender did not comply with the specifications, but Mr. Harris said it would be satisfactory, and the difference in cost is small.

Dalhousie, N.B.—Sealed tenders will be received by the Town Clerk until 8 p.m., Wednesday, March 5, 1913, for the following works:—

Contract B—Power house.

Contract G—Booster pump: (1) steam pump, (2) turbine pump.

Contract H—Two boilers.

Contract J—Electric light engines: (1) High speed steam engine, (2) Gas engine and gas producers, (3) Diesel oil engine, (4) Crude oil engine.

Contract K — Electrical equipment and distribution system.

Plans and specifications may be seen on and after February 10th at the office of the Chief Engineers, Mail Building, Toronto, or at Dalhousie, N.B. W. S. Montgomery, Mayor; Alex. J. Le Blanc, town clerk; Chipman & Power, engineers.

Bowmanville, Ont.—Tenders for the following will be received by the town clerk until Wednesday, March 19:—

Contract A1—Laying water mains in town.

A 2—Laying sewer pipes.

B—Constructing pump house.

C—Constructing three reservoirs.

D—Furnishing iron piping.

E—Furnishing hydrants, value, etc.

G—Furnishing electrically operated booster pump.

M—Laying 8 miles of gravity conduit.

S—Furnishing sewer pipes.

X — Constructing sewage disposal works. Chipman & Power, Mail building, Toronto, are the engineers.

Toronto, Ont.—Tenders for the steel superstructure of St. Clair Avenue bridge will be received by the Chairman of the Board of Control up to noon, March 11. Specification and tender form from Railway and Bridges Section, Department of Works, City Hall.

Toronto, Ont.—Tenders will be received by registered post only addressed to the Chairman of the Board of Control, City Hall, Toronto, up to noon on Tuesday, March 4th, 1913, for:

Concrete Mixers.
Grading Machines.
Tar Kettles.
Road Rollers, 3-wheel.
Road Roller, tandem.
Scarifiers.
Stone Crushing Outfit, complete (stationary).
Centrifugal Pumps, portable, with boilers, mounted.
Boilers Mounted.
Hoisting Engines and Boilers.
Derricks.
Clams.
Buckets.
Excavating Machine, complete.
Diaphragm Pumps and Hose.
Inspection Rods.

Specification and tender form may be obtained upon application at the office of the Purchasing Section, Department of Works, City Hall, Toronto.

Obituary

William Risdon, of St. Thomas, Ont., who founded the Erie Iron Works in 1895, died on Wednesday, February 12, aged 79. For many years he was in the hardware business in St. Thomas.

George Wm. Maynard, mining engineer, who introduced the Thomas basic steel process into the United States, died in Boston, February 13. He was one of the original members of the American Institute of Mining Engineers.

Trade Gossip

The A. G. Brown, Jamison Co., Ltd., of Vancouver, dealers in machinery, contractors' equipment and foundry supplies, announce that the name of the firm has been changed to E. P. Jamison & Co., Ltd.

The Bury Compressor Co., Erie, Pa., recently installed one of their variable volume air compressors in the plant of The North American Smelting Co., Sydenham, Ont., and another of the same style of compressor, but of the Duplex type, in the plant of The Standard Steel Construction Co., Port Robinson, Ont.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

St. John, N.B., Feb. 17.—About fifty men were put to work last week in this city on the site of the new sugar refinery to be built here by the Atlantic Sugar Refineries Ltd. Mr. L. R. Wilson, who has opened up offices in the capacity of treasurer and manager, is taking charge of the operations now under way, and in a few days it is planned to materially increase the present staff. The refinery when completed will be one of the most up-to-date of its kind in Canada or New England, and the seven buildings to be erected for its operations will be a valuable addition to the industrial plants of this city. All the buildings with the exception of the warehouse are to be of fireproof construction, with steel beams and columns with brick enclosure, and partition walls also of brick. The pan and melter houses and machine shop will be constructed of extra fireproof material consisting of two inches of cinder concrete or hollow tile. The floor construction in the different buildings is to be of reinforced concrete slabs on top of steel girders. The floor coverings are to be of granolithic cement, asphalt, or maple, depending on what is considered the better adapted to the different structures or departments. Electric elevators and modern sanitary fixtures will be installed and the whole suite of buildings will be thoroughly up-to-date in every respect. When completed, the refinery will have an output of 2,000 barrels a day and will afford employment to about 700 men. It is estimated that from 150 to 200 tons of coal a day will be required to operate the plant.

R. E. Chadwick, manager of Foundation Co., Ltd., for Eastern Canada, was in the city this week, and said that the work of excavating would be pushed with all possible rapidity, and that very soon about 300 men would be employed in this connection working night and day in two or more shifts. In a few days the contracting plant will arrive in the city and a start will be made on sinking the 107 caissons to be used. It is thought that in about three months, the foundation work will be completed, and there is the possibitity that before then the steel work on the building will be in course of erection. The site chosen for this gigantic plant is a splendid one and the dock facilities provided are expected to prove of distinct value, permitting even the largest of sea-going steamers to moor at the wharves on which the buildings will border.

Mr. Stanley Elkin, of the Maritime Nail Co., St. John, has returned after a trip to Europe which he undertook in the interests of his firm. He was away about two months. He said that at present he was not prepared to divulge any arrangements which had been made or the precise nature of his visit to the Old Country, but he could say definitely that there would be considerable local extension to the present plant, requiring a heavy financial expenditure. More machinery was to be installed, and provision made for increasing the output, which at present is looked upon as particularly large. He also said that his company intended to make a start sometime soon on a new nail factory at Fort William, Ont., finding splendid opportunities for business in that neighborhood and in the surrounding western territory. He was pleased to note that the City Council of Fort William had guaranteed the sum of $250,000 in bonds, a circumstance that was most encouraging to the enterprise.

The T. S. Simms building in Union Street, has been taken over by the Ganong Bros., candy manufacturers of St. Stephen, and work in the new factory will soon be under way with W. K. Ganong, general manager, and Fred Lockery, head of the manufacturing department. The company will operate under a different name, and will run the plant separately from that in St. Stephen. Mr. Ganong, who was in the city last week, said that there were great possibitities before the concern, and the business amounting to $850,000 which was done last year, he hoped to see increased to the million dollar mark this year. In the new St. John factory there will be installed machinery valued at $20,000, part of which is already on its way here. About seventy hands will be soon employed, and early in the fall fully 150 will be at work. If everything goes well, there will be 250 men employed next year.

The machine shop conducted in Moncton, N.B., by John Abrams & Sons was completely wrecked this week by an explosion which occurred about 1 o'clock in the morning. The boiler blew up shattering the walls of the building, and blew off the roof, practically demolishing the structure, which for work purposes will have to be rebuilt.

Toronto, Ont., Feb. 18.—Several of the big machinery and supply houses in Toronto found business only fair last week. A. R. Williams & Co. secured the order of the Toronto Structural Steel Co. for punches, plate rolls, etc., which company, as reported in Canadian Machinery two weeks ago, was incorporated at Ottawa with a million dollars' capital. Besides the above, the A. R. Williams Co. secured the entire equipment for the new structural steel works at Napanee, Ont., which included boiler plate rolls, punches and shears. The Great Western Iron and Chemical Co., of Prince Albert, Sask,. who recently had representatives in the city buying heavily of machinery, also placed their order with A. R. Williams & Co. This has now been filled.

Pig Iron.

Canadian pig iron furnaces show a good week of business. Drummond, McCall & Co., who have a furnace at Midland, sold a considerable quantity of pig iron, scattered over a number of purchasers. There were no really big orders, however. Their manager in Toronto sees no symptoms yet of the price dropping, and their product, f.o.b. Midland, remains at $21 for Nos. 1 and 2. Canadian manufacturers are not buying pig or steel beyond their immediate needs, claiming that the price is too high, and expressing their firm conviction that a drop must take place before long. Some English pig iron is being brought to this country for consumption in the Province of Quebec, but very little is being bought in or around this city, the price being too high.

Plates, Tubes, Structural Steel.

This is not the time of the year for big purchases of structural steel. Big buyers all had their contracts laid months ago, and specifications are now coming in for spring delivery. There is, however, a good steady demand for small quantities. A large American steel concern, with offices in the city, has reduced the price of its small shapes from 2.5c to 2.4c per lb. Inquiries for warehouse import are strong. There is a heavy demand for boiler tubes, mainly for repair work. The steamship lines, with early opening of navigation in sight, are all overhauling and repairing.

Sheets and Bars.

This is an off season for sheets, as the stove manufacturers are doing little buying, most of them being covered for the first half of the year. Specifications, however, are coming in in advance of contracts, and prices are firm. American mills are booked up for the first half of the year with orders, and some even into the third quarter. Specifications should, therefore, be in early. The same

Pure Manila rope	17

THE GENERAL MARKET CONDITIONS AND TENDENCIES.

(Continued from page 188.)

mills are booked up to the end of the year for bars. Toronto warehouse price for bars is 2.5 cents per lb, although they may, perhaps, be had for less. There are, of course, some mills in Canada not so busy as others; these are making prompt shipments. It was rumored in the market this week that a Canadian railway was negotiating for a supply of rails, and one firm in particular was making a bold bid for the order. The demand for steel wire keeps about the same. There is an unusual demand for baling wire for hay. Prices are the same, and business is good. The same applies to nuts, screws and bolts.

Metals.

The price of copper, the fall in which was noted last week, and which dealers did not believe could get any lower, has been falling nearly the whole week, much to the dismay of local dealers in metals and old material. The result has been stagnation in the market. This condition is applicable to practically all the metals. It is attributed to the uneasiness at present prevailing on the European Continent. The price of tin has fluctuated considerably during the week. Tinplate mills are fairly busy, and can fill orders in three months.

Coke and Coal.

Connellsville coke is a little easier, but this does not affect the market in Canada, as practically all the coke used is Solvay make, made in Detroit. In spite of a scarcity of railway cars, dealers are managing to keep Canadian furnaces and foundries well supplied. The end of the embargo on coal existing at the border on the G. T. R. resulted in a good supply of coal last week. This was followed up, however, by a similar condition on the C. P. R., so that coal is about as scarce as it was two weeks ago.

Montreal, Feb. 18.—The general machinery market during the past week has been excellent, all dealers reporting a good amount of business on hand. No special line seems to be exceptionally strong, the large machinery houses and the mill supply men being pleased with present conditions and optimistic as to the future. The large dealers are now awaiting the letting of contracts for the machinery and crane equipment of the N.T.R. car shops at Transcona. Rumor says that a decision on this matter will be quickly reached and that the shops will be rushed to completion and all equipment installed in from 6 to 8 weeks.

The Canadian Pacific Rly. have broken ground for their new steel car shops at Angus, and this will probably mean the expenditure of fully $100,000 for equipment in the near future. An addition of 85 feet is also being added to the locomotive erecting shop. Altogether prospects are very bright, though the general tightness of money is resulting in a little difficulty in making collections.

Trade Gossip

The Smart-Turner Machine Co., Hamilton, Ont., have recently secured the following orders:—La Hine D'Or Huronia Dane Station, Ont., duplex pump; The Howard Smith Paper Mills, Ltd., Beauharnois, Que., three centrifugal pumps; Hamilton Bridge Works, Hamilton, Ont., duplex steam pump; Dominion Canners, Ltd., Aylmer, Ont., duplex outside packed plunger pump; Dominion Steel Castings Co., Hamilton, duplex steam pump; H. Brennan & Sons Mfg. Co., Hamilton, duplex steam pump; M. O. L. Brewer, Fenwick, Ont., Rotary pump; The Western Dry Dock & Shipbuilding Co., duplex steam pump; The Great Lakes Dredging Co., Port Arthur, Ont., steam vacuum pump.

The John McDougall Caledonian Iron Works Co., Ltd., of Montreal, have been awarded the contract for two 12 million Imperial gallon pumping units, at a price of $50,046. The units consist of two 20-inch, three-stage Worthington turbine pumps, direct connected to 750 brake horse power Browett-Lindley high speed engines, running at 350 r.p.m. and operating against a water pressure of 92 pounds. The three-stage pump of the John McDougall Co. was selected as a type that already had given the city very satisfactory service for a number of years, operating 24 hours per day. This makes the thirteenth pumping unit furnished to the City of Montreal by the John McDougall Co. and Henry R. Worthington, aggregating a total pumping capacity of over 100 million Imperial gallons.

Catalogues

The Powers Regulator Co., 111 Fifth Avenue, New York, forward a copy of their bulletin dealing with the Powers system of automatic temperature control in connection with the heating of buildings. This system is too well-known to need more than mention, yet even those who are thoroughly familiar with it will doubtless value this catalogue, which is very clearly written and of most artistic appearance.

STAMPINGS Special Manufacturing to Order

No matter how hard a stamping problem you put up to us, the chances are we can satisfy you. Many people use stampings in place of castings and find them more satisfactory and often cheaper. Send blue prints and samples and let us quote you.

The Silent Partner is an interesting little magazine. We send it free—when there's a reason

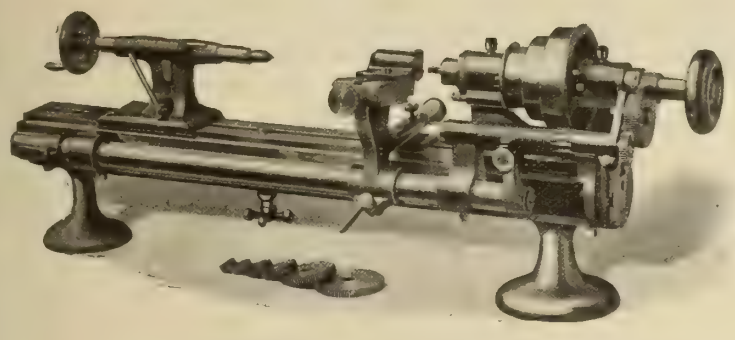
Liquidator's Sale

Of the Assets of Canadian Gas Power and Launches, Limited, Manufacturer of Stationary and Marine Gas and Gasoline Engines, and of Motor Launches, Dufferin St., Toronto.

The assets comprise a magnificent freehold manufacturing site with an area of 75,000 square feet, adjacent to and with shipping facilities over the lines of two large railway systems, modern concrete manufacturing premises, complete equipment of plant and machinery, and stock of marine and stationary gas engines, engine repair parts and raw materials. They will be divided into, and will be sold in separate parcels as follows:



(1) Land and buildings suitable for any manufacturer, but especially for a manufacturer of metals.
(2) General machinery and plant suitable for the mercantile purposes of all machinery dealers.
(3) Special machines, tools, jigs, patterns, drawings, etc., with stock of engine repair parts and raw materials, the acquisition of which will give a monopoly to the purchaser of the valuable repair and supply business arising out of all engines heretofore manufactured and sold by the Company.
(4) The stock of manufactured engines suitablefor the mercantile purposes of all dealers in such.

Upon application to the undersigned, interested parties will be furnished with full particulars of the business, assets, and terms of sale, and will be given facilities for the inspection of the property.

Tenders for the purchase of the above will be received by the Liquidator up till four o'clock p.m. of the 8th day of March, 1913.

JOHN MACKAY, Liquidator

Toronto General Trusts Building, 85 Bay Street, Toronto

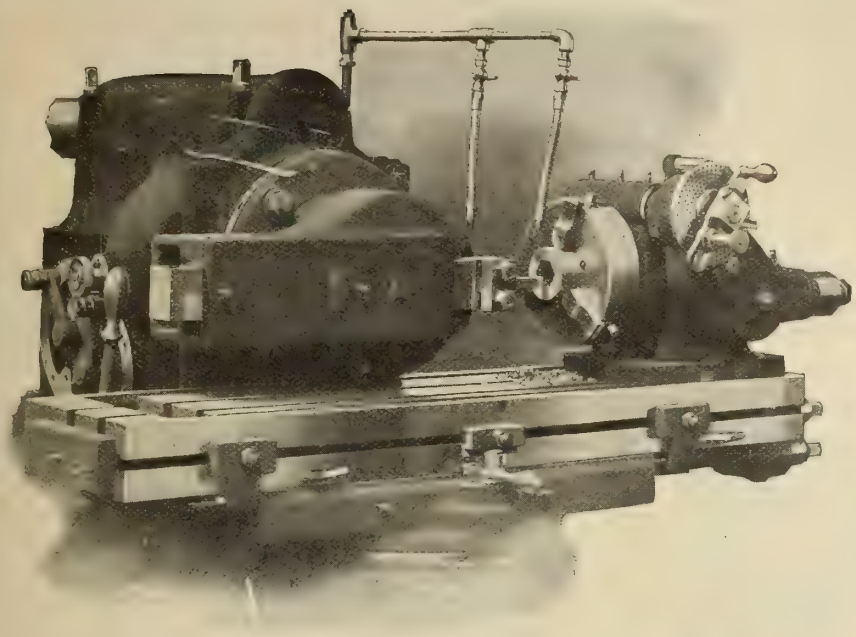
MR. SUPERINTENDENT OR FOREMAN—

¶ The easiest way to win the favor of the boss is to serve him well. Make money for your employer and up goes your pay.



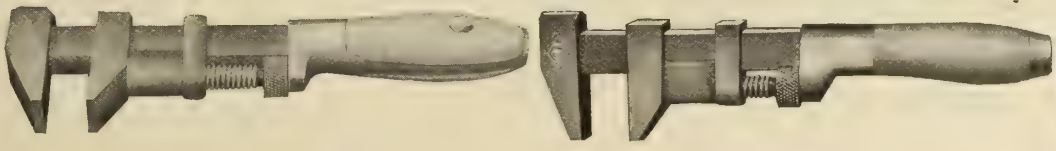
¶ Brain means gain—use your head if you want to get ahead. Serve with mind as well as hand. Efficiency Engineers charge $50 a day for telling your boss something you could tell him yourself. If you can save five minutes on a half-hour job, do it. If you can do with three men an operation that now requires five, by switching things around a little, or by installing some new machine you see advertised—take it up with the boss at once. That's what he pays you for. You're not a machine—you're a man. Cut down the cost of manufacturing a certain article one per cent. and figure out how much you can save in a year! No employer would be foolish enough to pocket all the profits. Part would go to the customer, part to dividends, and the rest to you.

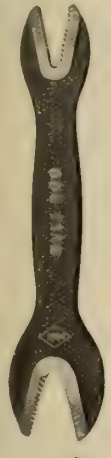
¶ Study the advertisements in "Canadian Machinery." They will tell about labor-saving devices; about short cut machines that will save your employer's money; about new ideas and of old ones remodelled and improved.

¶ The men who make the goods advertised in "Canadian Machinery" advertise them because they have merit, because they are well made, and because they are designed to save and make money for the man who buys them.

¶ Get to know the men who advertise in "Canadian Machinery." Know them by name and by machine. Write for their catalogues, and when you get them study them. To-morrow the boss may ask your opinion of a certain machine. Be ready for him. Be familiar with advertised goods—they are the most reliable. They are produced by the most progressive manufacturers. You cannot go wrong in recommending them.

¶ Show your employer that you have his interests at heart and he will show you a raise in pay. The reward of loyal service is a cash one. See that you give, and you will surely get.





EVERY tool room should have a Milwaukee Universal Milling Machine, every universal milling machine should have a slotting attachment and every tool room foreman should have our latest book—to be had for the asking,

Nicholson
Made Files
Reduce Filing Costs

They embody experience, highest quality material and most up-to-date methods of production.

Cut fast and clean, and remove stock with little labor and expenditure of time.

Whatever your requirements may be we have a file among the 4,000 kinds which will surely meet them.

Nicholson-Made Brands manufactured in Canada are:

AMERICAN, ARCADE, GREAT WESTERN, GLOBE, EAGLE.

See your jobber or write us.

NICHOLSON FILE CO.
PORT HOPE, ONT.

Garvin Circulars

Frequent changes necessitate issuing circulars from time to time to keep our printed matter up to date. The following is a list of circulars, profusely illustrated, describing our latest improvements on the various machines mentioned. If any of these circulars may interest you, we shall be pleased to send you same on request.

We have in preparation a new catalogue, which will include our complete line, and will be ready for distribution shortly.

Circular No.	Describing
128	No. 1½ Universal Milling Machine
139	No. 22 Vertical Milling Machine
140	No. 1 Rapid Screw Slotting Machine
142	No. 14 & 15 Vertical Spindle Milling Machines
150	No. 11 and 12 Plain Milling Machines
152	No. 2 Hole Grinding Machine
155	Thread Milling Attachment
156	Automatic Chuck Booklet
158	No. 9 Index Milling Machine
159	No. 2A Universal Milling Machine
160	No. 3 Screw Machine
161	Die Slotting Machine
163	Automatic Chuck and Stop and Open Countershaft.
164	No. 2A Plain Milling Machine
165	No. 2 Rapid Screw Slotting Machine
167	No. 13 and 13½ Plain Milling Machines
168	Grinding Machines (Cutter and Surface)
170	No. 22 Plain Milling Machine
171	Motor Driven Machine Tools
172	No. 15 Plain Milling Machine and 60 in. Feed
175	No. 2 2½ and 12½ G.F.H. Screw Machines, and No. 22 22½ and 32½ G.F.H. Monitor Lathes
176	No. 00 Screw Machine and No. 11, 12 and 12½ Screw Head Shaving Machines
177	Plain Head Screw Machines and Monitor Lathes
179	Duplex Horizontal Drills
180	No. 3A Plain Milling Machine
181	No. 3A Universal Milling Machine
182	No. 21 Plain Milling Machine
183	No. 1, 2 and 3 Hand Milling Machines
184	No. 14 Mfg. Plain Milling Machine
187	Tapping Machines (Automatic, Horizontal and Vertical)
188	Friction Pulleys and Countershafts
189	Turret Indexing Mechanism
190	No. 2 and No. 3 Duplex Milling Machines
191	No. 2 Mfg. Universal Milling Machine
192	Automatic Oil Grooving Machine
*194	Cam or Form Milling Machines

*In Press.
